THE MICHIGAN ASSOCIATION.

A MONG the game societies of the country the Michigan Sportsman's Association holds a foremost position. Its members appreciate the importance of the work to be done by such a society, and they do it. The annual meeting at Grand Rapids the other day was characterized by the same spirit of earnestness that has marked the meetings of former years. The papers read and the discussions elicited by them are well worth the attention of sportsmen. We devote liberal space to a report of the first day of the meeting, furnished by a special correspondent. A report of the second day's proceedings will follow. We congratulate the Michigan Sportsman's Association upon the high stand it has taken, upon the dignity with which it invests its meetings, and upon the good service it is performing in elevating the standard of legitimate field sports in Michigan.

A SUICIDAL MOVE.

THE committee of the National Rifle Association seem determined to demn the proposed international military match, and yesterday the following cablegram was sent in response to that received from Sir Henry Halford;

NEW YORK, Feb. 1, 1882. Halford, London:

Guarantee of return match next year required. Also waiver of proving rifles,

Wingart.

In other words, the American committee have begun the absurd task of trying to drive the British lion. Should the British Council decline to give any such guarantee, as they surely will if they have an ounce of gunption, it will leave the matter thus: The N. R. A, of Great Britain have made a perfectly fair offer for an International match, and the N. R.-A. of America have sneaked out of the contest on a totally irrelevant issue, raised by themselves, and which the self-respect of the Englishmen would not allow them to ac-

THE DESTRUCTION OF LARGE GAME

A N interesting phase of game protection at present relates to the preservation of the large game of the West. Ever since the completion of the Union Pacific Railroad, which made accessible to sportsmen so large a section of the far West, the slaughter of the larger mammals has been going on, and each year increasing. It took about seven or eight years to wholly exterminate along this road the buffalo, which in the good old times we have seen blackening the Platte bottom for miles. These poor silly beasts were so easily killed, and, from their abundance, offered so rich a reward to the hide hunter, that every idle fellow in a district could make good wages by butchering them. The other large game, for reasons apparent to every hunter, will last much longer, and yet from many sections the elk and the antelope have been driven, and are as utterly unknown as they are in the streets of this city. Two reasons exist for the appalling diminution of our big game. It is destroyed by skin hunters and by pleasure parties. The former are much the most destructive, yet the latter do a vast amount of harm. They kill simply for the pleasure of shedding blood. Some decided action is needed to check the slaughter which has been so long going on. Decent, self-respecting men will hunt in the mountains and kill only enough meat for their use, but too often tyros who are respectable and should know better, are inflamed by the taste of blood, and are as keen to kill as a butcher could be. We commend to the attention of our readers a letter printed in another column. The question there raised is a live one, and should call forth expressions of opinion from every one who has ever used therifle on large game. Later we shall have something to say on this subject.

A CLOSE CALL.

A T about ten o'clock Tuesday morning the occupants of the Forest and Stream office were startled by the excited cries of a great crowd in the street below. Rushing to the windows they were hailed by the cry from a hundred throats, "Save those men!" Glancing in the direction indicated by multitudinous arms, they beheld the adjoining building, No. 37 Park Row, enveloped from cellar to roof in one terrific sheet of flame. Clinging to the narrow window cornices, and painfully making their precarious way along toward the Forest and Stream windows, were two men. They had now proceeded on their perilous journey as far as it was possible for them to go, and had come to a wide space. which, unaided, they could not pass. The flames were leaping about them. Strength and courage were exhausted, The excited throng of people below expected to see the two men fall, as others had already fallen, from the burning building to the pavement. But quicker than it takes to write it, three Forest and Stream men, Messrs. Mason, Banks and Gibbons, had rushed to the rescue. Leaning far out from one of the Forest and Stream windows, sustaining each other and bracing themselves against the huge sign, they stretched down, seized the terrified men and drew them in, while a great cheer went up from the crowd. The men thus rescued were Leslie C. Bruce and E. N. Carvalho.

The ominous cracking of walls, and the inpouring smoke warned the Forest and Stream staff of their impending danger, and their attention was now turned to securing their own safety and rescuing from the flames such office property as might be saved. There seemed to be no possible escape for the Times building in which our offices are located. But thanks to the efficient service of the Fire Department, and to the superior stability of the building itself, the peril was arrested, and to-day the Forest and Stream rejoices that it did not share the fate of its unfortunate neighbors, who lost their files, subscription books, and in fact almost everything.

Among the journals whose offices were thus destroyed were the Observer, Scientific American, Scottish American Journal, and Turf, Field and Furm. To the editors and proprietors of each the Forest and Stream extends its sympathy.

In the confusion and hurry attendant upon such a crisis, manuscripts and letters have been mislaid, and possibly some of them lost. We must beg the indulgence of our friends for the consequent delay, and we ask their patience until we can bring order out of chaos and things run smoothly again,

It was a close call,

SIGNS

IN our last issue an entertaining angler—they are all enter-I taining, by the way—invites his brethren of the angle to give their experience with "signs." The subject is a good one, and one that the craft is well versed in, each individual having a stock of his own upon which he relies more or less implicitly. Many of the signs given in books are traditional ones which have come across the water with our first angling literature, and have been copied in books on this side without question as to their value when thus transplanted. Of such is the old rhyme which lays down the law of good and evil winds, and tells us :

> "When the wind is in the north The skillful fisher goes not forth. When the wind is in the east It's good for neither man nor beast.
> When the wind is in the south
> It blows the bait in the fishes mouth. When the wind is in the west It is then the very best.'

This evidently has a local application, for in a country where streams run in all directions a wind which blows up one stream will cross others and even blow down some of What is needed in the matter of wind signs is evidently a calculation for each locality in the matter of currents of air from different points of the compass, or a formula that will forecast the prospect of success in winds lowing up, down or across the waters.

The moon is also an element taken into the problem of the appetite of fishes by some, while all know the edge put upon their desire for worms by a warm rain. The seaside folk have an heirloom in the verse referring to the size of chestnut leaves and the catching of blackfish (tautog), while every schoolboy knows and repeats the caution to a profane com-panion, "Don't swear or you won't catch fish." It would be It would be interesting to have facts bearing upon this latter proverb. Do fish reject the bait of the profane? Can they recognize the difference between a justifiable "hang it!" when a line is actually hung on a snag and those more reprehensible words that the thoughtless or wicked fisherman is alleged to use when his patience is tried by the breaking of his tackle at a critical moment.

"Uncle Thad." Norris had a sign by which he recognized the accomplished angler. The genial old man was often bored by men who wished to claim to be up in the higher degrees of the art in order to place themselves on a fair footing with the great angling authority. One day he happened in Pittsburgh and was introduced to a man at the hotel who immediately began to try and impress Mr. Norris with his importance as a mighty fisher, and the following colloquy

Man-"Glad to meet you, Mr. Norris, have read your book and often wanted to know you. I am counted the best fisherman in these parts."

Uncle Thad.—" Do you tish with the fly?"

Man—"Always, Mr. Norris, always." Uncle Thad.—"Do you use a float and sinker on your fly?" Man-"Oh, yes, always, Mr. Norris, always.

Uncle Thad .- "Do you always spit on your bait for luck?" Man—" Certainly, Mr. Norris, always do that."

Uncle Thad .- "Then I am proud to meet you, sir. I see that you are an accomplished angler who is up on all the minor points that make a finished and artistic fisherman," and without a smile he bade him good morning and the man was afterward known as the man who used a float and sinker on his fly,

Spitting on the bait is a subject that we approach with diffidence. It is not perfectly clear that if one expects to rate as a finished angler he must expectorate on his bait. It may depend upon what he chews if the fish choose to chew on his worm. Then again, if tobocco juice is the proper thing on a worm, is it certain that it would be relished upon a clam? We confess that we have not investigated this question as it deserves. Epicures may differ on the propriety of serving champagne with oysters, and why may there not be differ-ences of opinion among fishes? We throw out these hints to our readers for them to enlarge upon and second "Waway anda's" motion for "experience."

Let us, then, hear from the wise and prudent in these things of their success when all the "signs" failed them; and perchance, also, of failure, when "signs" promised luck.

THE BRITISH MATCH.

THE cable message from the American Directors to the British National Rifle Association Committee, given in our last issue, in which the conditions of the international match were accepted, barring the proposed kneeling at 200 yards, and demanding a guarantee of a return visit in 1883, drew out a very prompt response from the Britishers. On Wednesday last came the cablegram from Sir Henry Halford to Gen. Wingate, saying: "We accept standing, 200. Return match must remain an open question." This response should be entirely satisfactory to our American shots. The favorite position at 200 yards for our marksmen has been readily granted by the challengers and that absurd demand for a guarantee has been as promptly The word was an unfortunate one to use, but no other seemed to fit the place better, and so it went over the wire. What we want here, and what the above message did not properly set forth, was an assurance on the part of the British Association that there should be some sort of reciprocity on their part respecting visits. promise should not be so strong as a guarantee, but it should be made a pledge as shall lead us to reasonably expect the pleasure of a representation from Wimbledon at Creedmoor in 1883. The Committee feel that should the American team this year fight a losing or winning battle, that the next match should be fought out on this side the ocean. In this they but reflect the opinion of the general company of the National Guard of the city and country, and it seems strange that there should be any need of giving more than a hint to the British Volunteers that a return visit would be acceptable to their American cousins. Another week should see the definite settlement of this last possible point of doubt in connection with the match, and then all will be plain sailing. There is much positive hard work to be done, and with the experience which the selection of several previous teams has given there ought to be no repetition of previous blunders. The error of having the team manage the captain must not be repeated. Instead, the team should go forth in the character of a sub-committee of the N. R. A., subject to such instructions as the N. R. A. may give it, and amenable to the greater body. Meanwhile it would well become ambitious marksmen in the National Guard of any State to get all the practice possible, under the assurance that those having the final naming of the team will not be governed by any narrow views and local prejudices.

ATHLETICISM IN ENGLAND AND AMERICA.

To a recent number of the Atlantic Monthly, Mr. A. Granville Bradley contributes a most instructive and valuable paper on the prominence of Athleticism in England. In this sketch he calls attention in a very forcible way to certain striking characteristics of the English modes of thought in regard to the importance of outdoor sports as contrasted with the American view of the same subject, and draws a picture of the high esteem in which success in athletics is held in the mother country, which will, we feel sure, be new to many readers.

The importance of a healthy body is only just beginning to be realized in America, but that some conception is beginning to be had of its necessity, if the mind is to do its full share of work in the best way, the growing interest in field sports testifies. The Americans of to-day are the sons of fathers, who for hundreds of years have been accustomed to work. and these sons have thus inherited a disposition to labor, in one form or other, which makes their office work almost a second nature to them. It requires a decided effort on the part of the average American for him to break away, and take even a few days' recreation. A large class of Englishmen, on the other hand, coming from a stock whose sole occupation for generations has been amusement, inherit the mental tendencies of their ancestors, and give themselves up to the business of pleasure. But the surplus energy of the Anglo-Saxon race must find a vent, and the result is that the Englishman plunges into cricket, coaching, hunting, and shooting with as much earnestness as if his living depended on his skill at the bat, his handling of the ribbons, his seat in the saddle or his prowess with the gun and knowledge of the habits of game. So far as his methods of thought go, he might almost as well be a professional cricketer, coachman, huntsman, or gamekeeper.

This large and constantly increasing class of Englishmen, possessed of abundant means, are so earnest in their endeavors to occupy themselves-to "kill time"-that they undertake the pursuit of field sports with an energy that the most ardent business man could no more than equal. To them the ambition of life is to become a M. F. H., the champion cricketer, or the best pigeon or battue shot. This ambition absorbs their energies, and blinds them to all else. It is difficult for the American to understand how it is that an educated Englishman should spend his whole time in playing cricket, hunting or coaching, to the exclusion of any other interest in life, and equally incomprehensible to the English mind is the devotion of the American to business. Yet in a very large proportion of cases, the motive is the same-occupation. It is not simply the desire for dollars that leads the American to attend so assiduously to his business, to put into at all the energy of his race, nor is the ambition to excel in athletic sports the fundamental reason of the Englishman's devotion to the bat or the saddle. Deeply underlying the reasons, which upon inquiry each would give for his course, are the tendencies of his mind inherited from generations of ancestors, educated in such diverse ways.

"I care for nothing but hunting, shooting, and fishing, writes an ex-landlord, quite lately, while inquiring through the columns of the London Field, for a cheap residence abroad. You must be an Englishman," says Mr. Bradley, "to understand the exact spirit in which this is written, and the spirit in which it will be taken by the masses. Such a confession in the columns of the public press in any other country would be taken as the apology of some harmless idiot. Not so here, however. Impossible as it may seem, an Englishman will recognize it instantly as having a great deal more of the boastful than the apologetic, and two-thirds of the rising generation, on reading it, will mentally chronicle that unknown curiosity as 'a fine fellow.' The singularity, how-ever, lies not so much in the fact of a vast number of individuals, whom accident has made independent of occupation s regards their living, devoting themselves with business-like energy to self-indulgence, as in the more than toleration, the semi-admiration, with which the workaday world, in its ntervals of labor, from the prime minister to the agricultural laborer, looks on and cheers the barren feats or the school-boy gambols of grown-up children. Physical superiority, short, is the fashion in England, and the public will shout louder and longer at excellence in amusements than they will at excellence in those qualities which help to advance their country, and the cause of civilization, and the good of

The influence of public opinion in matters of this kind is very strong, and differs widely in the two countries. Up to within a few years the American who had no business, no regular employment, was looked upon as a ne'er do well, and dark prophecies as to his ultimate fate were indulged in by the wiser heads of the community. It was regarded as little less than a crime by the solid conservative business men of our cities for an individual to indulge his tastes for shooting or fishing. The public sentiment of England, on the other hand, not only tolerates, but most vigorously applauds the man, who, having devoted his life to some particular form of athletics, has become pre-eminent in this branch. champion cricketer, rider or shot of his own district or county is generally esteemed. He is looked mp to and admired by the masses, and, whatever his rank, may be the companion and friend of those occupying the highest stations in his own neighborhood. At public dinners he sits at the right of the chairman, and the newspapers speak of him in their lists of the "prominent" persons present at social gatherings.

An exaggerated respect for prowess in athleticism is directly fostered by the early education of the English youth. From the date of a boy's entrance to a public school he is taught by the example of his fellows, and not infrequently by that of his preceptors, to regard as altogether worthy of admiration those who stand in the first rank in athletics, and he of course at once joins the throng of their worshippers. But no such general homage is paid to those who take the highest frank in the studies to which he is now being introduced.

The tendency of such influences as now largely prevail in England is in the direction of narrow-mindedness. The average young Englishman is likely to regard with contempt any one whose views are not molded after his own. He has his standard of what is excellent and desirable, and unable to conceive that any other standard should exist. He does not contemplate it as possible that he should be wrong, but assumes that those whose ideas differ from his own ar of necessity short-sighted, stupid and wrong-headed. The life of a man who devotes all his energies and all his time to fox hunting, cricket and coaching, cannot by any stretch of courtesy be called broad. Nor is there any opportunity to such an one for development or improvement. We expect that with added years a man's nature and intelligence shall grow and mature, that by his reading and his knowledge of events his mind shall become as time goes on, in some sense a storchouse of knowledge from which we may draw information that is of value. But nothing of this kind can take place with a man whose thoughts are wholly centred on some form of outdoor sport. He must of necessity stand still, so far as mental development is concerned, and, at this stage of the world's progress, to stand still is to retrograde. Every one else is moving forward, and he who does not make some advance, even though it be but slow, is sure to fall behind.

The advantages of a thorough physical education are very great, and are coming to be more and more highly appreciated. There is danger, however, that in our respect for the healthy body, the advantages of a healthy and cultivated mind may come to be in some measure overlooked. In the well-balanced constitution the two must go together to form a harmonious and admirably adjusted whole. Probably the prominence at present given to athleticism in England, does but little real harm, but on the other hand, it cannot be denied that there is a vast amount of energy wasted in pursuits of this character, which, if properly directed in other and more useful channels, might do much for the benefit of the society at large.

THE WATER COLOR EXHIBITION.—The Fifteenth Annual Exhibition of the American Water Color Society opened on Monday of this week. This year's collection of pictures is the best that has ever been exhibited by the society, far surpassing those of 1880 and 1881, which were of about equal

merit. Besides the old and well-known names in the catalogue we find a number of new ones whose works are of unusual excellence. The etchings are especially worthy of carreful study. The very large number of pictures sold during the private view and on Saturday shows very clearly that the excellence of the exhibition is appreciated by connoisseurs and art lovers. About eighty pictures were sold for \$9,000, and seventy etchings for \$600. No previous exhibition has shown equally good results at such an early day, and this promises that the present one will be, from all points of view, the most successful exhibition ever held by the society.

Memory in Lions.—The charming story of his pet lions, told by Mr. Thompson in our issue of Jan. 19, is supplemented by a late experience of Mrs. Lincoln, of Boston. This lady raised a pair of lion cubs in her Boston home some years ago, a letter from her in relation to the subject having been published in the Forest and Stream at the time After a time Mrs. Lincoln parted with her leonine pets, and her visit to one of them, Emperor, the other day, is described in the Boston Post. The lion recognized her and manifested his delight by the most extravagant demonstrations. He licked her hand, sprang up and placed his paws on the grating, tried to force his head between the bars. Mrs. Lincoln laid her head against his vast jaws and put her arms through the bars around his neck, and the monstrous animal purred like a great cat. He put out his paw to "shake hands," at his mistress's command, and then, as if overcome with joy, lay down and rolled over and over, uttering meanwhile queen little grunts and growls, and behaving altogether like a frisky

What It Means.—With its new outfit the Forest and Stream is one of the handsomest journals of the day. It ought to be. Fine diamonds deserve fine settings. One or two further alterations in our "make-up" had been anticipated for the present issue; but the Fire Insurance Patrol unceremoniously took possession of our offices last Tuesday, and threw a wet blanket (in fact half-a-dozen of them) over our plans. We trust that the readers of the Forest and Stream may accept its new typographical dress as an improvement. It is certainly intended so be such—and more. It is an earnest of our determination to keep the Forest and Stream where it has been for years—in the lead of all journals of the world devoted to manly field sports.

PORTRAIT OF HERBERT.—The Greenwood Lake Association, whose club-house is in the Warwick Woodlands at Greenwood Lake, has requested Mr. Matthew Wilson to paint for the club a portrait of William Henry Herbert (Frank Forester). The club would be pleased to communicate with any individuals who may have in their possession pictures of Herbert that might be useful to the artist. The sccretary of the association is Mr. Wm. O. McDowell, No. 5 Cortlandt street, this city.

THE CUVIER CLUB, of Cincinnati, gave a reception last evening, the occasion being the opening of their elegant new club house, No. 32 Longworth street. We are happy to chronicle this indication of the Club's prosperity and enterprise.

ENGLAND CALLS HIM HOME.

[WITH THE "FOREST AND STREAM'S" ACKNOWLEDGMENTS TO THE FEBRUARY "CENTURY."]

ONE of our young Robin Hood's lately became inspired; and blew off a bubble after this wise:

When erst through Chevy chunky flew, The bird-bolt through the mirky mew,

Then his bubble burst, but a little soap and water started him again. This time it was:

Blow I my horn till some shall come
To tell me England calls me home,
Or may be it 'ull be Brian Boroo
That calls me home with a pwhilla lew!
But still he was not called. Then he wailed:

When in the squaggy, squashing bog
'I shot the bully, bellowing frog,
Or through the chippy, through and through,
I drave my arrow, strong and true,
I listened long for England's cheer
To call me to her beef and beer.
But all I beard was only this,
To scantly fill my earthly bliss:
'Come to me, Maury, if thou must,
But effscom get thee up and dust.''

AN EASY READING LESSON.

FOR THE LITTLE READERS OF FOREST AND STREAM.

The Man from Town is out on the Duck Pass. He stands on the Point and waits for Ducks to fly by. He has on a White Shirt, a dark brown Coat, and a black Hat. You can see him a Mile off. Here comes a Duck. He is way up in the Sky, but the Man will shoot, all the same. Bang! Bang! Did the Duck drop? Not much!

The Duck files on. Look! there is a puff of Smoke near that Bush. Hark. Bang! The Duck drops in the Mud. A Boy wades out and picks him up. Now the Boy is back, out of sight, and all is Still.

The Man goes to talk with the Boy. The Boy has an old Gun, all Rust. The Lock is tied on with String. (I should hate to fire it.) But the Boy has a Nico Pile of Ducks. The Man has no Ducks at all, but he has Lots of Cash! Now the Boy has some Cash, and the Man has the Ducks. See the Boy grin! The Man will take the Ducks home, and tell his Wife that he shot them all, with his Fine New Gun. How Proud she will be of his Skill! Is it right for the Man to do this?

The Sportsman Tourist.

"CAMP CANUCK,"

LEAVES FROM A LOG-BOOK .-- VIII.

"Danse, moulin, danse.
Danse, moulin, danse!
N'entends to pas le moulin la-la?
N'entends to pas le moulin danser

N'entends to pas le moulin danser?"

S the last word of the song rang out loud and clear, and repeated itself again and again in echo and re-echo, Ivry, the miller, parted the bushes behind me, and stepped out by my camp-fire on the shore.

"Ha, Ivry! you're in a jolly mood to-night."

"There is nothing to cry about, Capitaine. I live, so I am jolly. Is not that enough? But come, "Toinette waits at the mill. Ahd she has bad humor, I can tell you."

"But I am not prepared, Ivry. Here is my log-book not written up for a week."

written up for a week."
"Cela ne yout rien!" snatching the book from my hand. "I shall show you the greatest masqueallonge that you h
never seen, And—"Toinette has very bad humor

"Cela ne vaut rien!" snatching the book from my mana.
"I shall show you the greatest masqueallonge that you have never seen. And—"Toinette has very bad humor to-night."
The log-book should have been written up, and I had determined to do it that night; but the St. Lawrence was still for the first time that week, and the chance of spearing a large masqueallonge was a temptation; besides, "Toinette "had bad humor."
"Well, Ivry, I will go."
"Then be quick, Capitaine," cried the young Frenchman, relighting his pine torch in the fire, and waving it around his head to start the flame. So away we went, Ivry's muscular form in advance, parting the thick undergrowth and lighting the way, while I followed as best I could, stumbling through the tangle of briery thickets that intervened between my secluded camp and the mill. As we entered the clearing near the latter a graceful form bounded suddenly from the darkness with the spring of an antelope, and a peal of laughter like the trill of a bird sounded in our ears.
"Oh, you are there, "Toinette," said Ivry, "with your tricks."

Antoinette Girasol was one of those strange beauties that

the hatter if graceful form bounded standardy from the darker services with the spring of an antelope, and a peal of laughter like the trill of a bird sounded in our ears.

"Oh, you are there, 'Toinette,' said Ivry, "with your tricks."

Antoinette Girasol was one of those strange beauties that are not seldom seen among the peasants of the Department of Eure, in north-west France. Was hair of a rich, light tinge, almost red in color, she had a pair of deep black eyes, set in a complexion of the fairest, and shaded by long lashes and arched eyebnows several shades durker than the hair. Her figure was full, but light and graceful, and her carriage erect, like that of her brother. Born and bred in the Canadian wilderness, she knew nothing of the outside world, and had a freedom from restraint and an innocent gayety that, in a city belle, would have passed for boldness; but in 'Toinette it was only the natural outcome of her innocent buoyance. As we wended our way to the boat, with both her hands clasped on my arm, she was seolding me in her quaint broken English bettery had lived in the "settlements," and declaring her intention of pushing me overboard if I did not spear the largest fish.

"An' if M'sieu Capitaine should nefaire come out of te water, I would not feel not one leetle bit had at all."

Ivry's boat was a fat-bottomed, homely craft, made of pine boards as they came out of the mill. In the bow was a grate of iron, raised on a pole. This the Frenchman filled with "fat" pine sticks and knots, and placing "Toinette and me side by side in the bow, he pushed the boat from shore, and standing in the stern, propelled us down the creek to the river with powerful strokes of his long-handled paddle.

"Make the fire, Capitaine," said Ivry, as the boat turned out of the creek and skirted the shore of the great river. The match caught the resinous pine in an instant, and the blaze was reflected in the water, laying bare its secrets to the bottom. The long-handled spears were poised ready to strike, and every nerve an Leaning over to strike, it seemed impossible to miss that huge hody not five feet away, but its very size told me that it would not yield without a fierce struggle; so steadying my excited nerves I made the blow with all the strength I possessed. Lucky for me that my foot was locked in that of the fair Toinette; and lucky, too, that that support was of the stoutest; for had it failed I would certainly have gone heels over head into the river. As it was, the boat turned nearly on its side, and the flaming brands from the grate fell all about

all about.

"Not so quick, Capitaine," said Ivry, whose native politeness would not permit him to laugh at my misfortune.

"Some more wood on the fire, and we try again."

Soon a pike appeared on "Toinette's side of the boat, and Ivry held us immovable for her to strike. Slowly poising the spear the French maiden sunk it silently into the water. The fish, transfixed by the barbed prongs, made the water boil with its struggles for a moment, but "Toinette brought it to the surface near her brother, who deftly lifted it into the stern.

stern.
"It is more lectle than that M'sien Capitaine did not get,

"It is more leedle than that M'sieu Capitaine did not get," said the Canadicane, with a smile.

In a few moments we reached a spot where Ivry assured us the largest fish were known to lurk, and I had not looked long before a very monster appeared beneath me. This time I must make no false move. My hand, trembled with excitement, but I got the direction carefully, and though it appeared to point to one side when inserted in the water, I drove the spear straight down. Instantly I felt that it was fast, and the struggles of the fish to escape became terrific. I feared the slender shaft of the spear would break when my efforts to bring the capitive to the surface were resisted, and so I tried to haul him in hand over hand. But Ivry warned me to desist, as the spear was not imbedded strongly. It required no little strength and advoirness to keep a hold on the shaft, while the enormous fish lasted and beat the water; but I clung bravely, and at last the masqueallonge floated near the surface. the surface.
"Il est hoyé," * cried Ivry, as by an effort we lifted the

monster into the boat, where he lay gasping, opening and closing his massive jaws, as if he would like to grind his enemies with the formidable-looking teeth.

On wo went again, starting myriads of small fry from the banks of weeds as we passed. Occasionally a long, slimy cel lazily propelled his snaky form beneath the bout, and tortoises as big as tubs went crawling beneath sunken logs and rocks. But our chosen game did not appear. At length my patience was nigh exhausted, and my eyes roved to the grand pine forest that lifted its head in majesty on the bank of the river. Then I let my gaze fall on the beauteous maiden at my side. The light from the grate fell on her soft, mobile face as she leaned over the side, watching intently. Her hair, loose from the round cap she generally wore, floated back from her head in a wave, and its auburn tinge sparkled and shone in the firelight like jeweled gold. The bure, fround arm that held the poised shaft was white as snow, and the shapely outlines of the graceful form were depicted as a silk-ouette against the dark background of the pine forest.

"If te (lantajne would not recarn) me he might see te grand."

"If the Capitaine would not regard me he might see to grand feesh," said Toinette, without raising her eyes from their steady gaze into the water.

"Let us return," said Ivry, "I think the fish are not well

Let us return I plied the single paddle, while Ivry took his turn with the spear, and the French girl sat at my feet, telling me in her patois of the great musqueallonge that nearly drowned her brother one time by pulling him bodity off the stern of a chaloupe from which he was fishing; and in this way we went back to the mill on the creek, the prattle and haughter of the joyous maiden continuing till we parted for the night at my camp—for they both insisted on accompanying me through the tangled underbrush to my little shelter tent. And as I lay on my couch of aromatic hemlock after the "bon-soirs" had been said and "Toinette had thrown a parting kiss to me and then run away laughing, I seemed still to hen the bird-like laugh and the quaint lisping patois of the young French maiden, and even in my dreams the clear voice would now and then ring and reverberate in my cars.

A WET WEEK IN WISCONSIN.

A WET WEEK IN WISCONSIN.

LITHOUGH a constant reader of Forrest and Stream.
I have never seen the charming village of Packwankee mentioned in your columns as a haven of enjoyment for sportsmen; and as I think the place really worthy of mention, I cull from my note book some hurried remarks jotted down during the pleasant month of October.

Our party numbered three guns, and the men who handled them were Adrian Corvalli, "Billy "Ruffin and the writer. We began shooting at Prairie du Chien, but owing to hot weather and the searcity of birds of all kinds we were forced to abandon this place and turn our steps toward Packwaukee; and here I cannot do better than to quote from Corralli's journal, who, it will be seen, did not much enjoy his semi-amphibious existence.

Corralli says: I pass over that part of our expedition which relates to Prairie du Chien, a locality famous for the large number of woodcock which are yearly killed on the banks of the Mississippi above and below one of the most picturesque little towns! I have ever seen in a country justly celebrated for the wonderful beauty of its seenery. I heard of many woodcock, both dead and alive, during my brief stay at Prairie du Chien, but the pleasure with which I listened to the sportsmen's tales was somewhat damped by my personal experience, which was of the most gloomy character. In fact I never saw but one cock, and that was a poor weak bird, which had been hit before, and was caught by one of the dogs without a shot fired. So much for Prairie du Chien, where I hardly pulled a trigger.

Packwaukee, which is situated on a muddy creek dignified by the name of the Fox River, affords few facilities for sport, although you can always see birds flying about, and occasionally even observe them alighting in wild and unaccessible places. Ducks and snipe are in the majority; but once every two or three years a prairie-chicken may be noticed, and there is an octogenarian in the village who hoasts of having seen a bevy of quail when he was a boy. The curse of thi

Woodcock are not found in Marquette county, Woodcock are not found in Marquette county, where Packwaukee is situated; in fact, beyond the eternal ducks and gymnastic saipe there is nothing to tempt the sportsman away from the very excellent shooting which is attainable at all points on the Ottawa River and the St. Clair Flats during

all points on the Ottawa River and the St. Clair Flats during the autumn months.

Wild geese, with more perception than one would expect in an historically stupid bird, invariably pass over this region; but I believe that early in the present decade a specimen was killed by a man who bore the romantic, yet familiar, name of John Smith. In front of the village and spanning the river is a bridge, over which the ducks fly early in the morning at a height which gives them very much the appearance of being a cross between humming-birds and bumble-bees. My heart sinks within me as I look back to the number of ineffective shots which I have fired at those infernal ducks from that accursed bridge, which, to my

excited and eager fancy, appears to be built upon the useless cases of cartridges I have exploded on an empty stomachfor you must know all this shooting has to be done before breakfast, which is in itself ridiculous, inasmuch as a well-fed man is twice as deadly in his aim as the poor wretch who has been forced out of bed at 5 A. M. and sent shivering into the damp mist of a late October morning.

Packwaukee is not a pretty plance, and stands knee-deep in sand throughout its dreary length. When you go out on that wretched bridge half the population watch you, and for some time business is partially suspended. I have already described with some care the treacherous nature of the bogs and wet prairies, over which I have roamed in every direction since ill luck planted me in this mud hole. Strange as it may appear, the waters of the Fox River-rival in subtle dangers the quaking bogs around it. Below the calm surface of the river hinge snags project nearly to the level of the water, and it is no uncommon thing when in a cance to find your-self suddenly perched on the top of some tree, the locality of which you never dreamt of. Once impaled in this way the great conundrum is how to get affoat again. The least incaution will assuredly send you out of your cance and into the water, (it froze hard hast night) and once in the water you naturally perish. Such an end would be uncomfortable, though quite in keeping with the principles of the Packwaukee people, who are cuthusiastic only on the subject of cold water. One morning I started out full of hope and breakfast and duck shot cartridges, but I had not gone forty yards from the principal holel when I felt my cance rise beneath me, and in a moment I was mounted on a flat-headed snag. Half the village canne out to look at me, and it was with the greatest difficulty that after many judicious struggles I at last found myself once more afloat.

I never saw really good shooting here except once or twice on the bridge before breakfast, But shooting breakers, but everything in

daily wallowed in it since; and in all my schemes for amusement and exercise I find that mud is the preponderating ingredient.

To the stranger who proposes to visit Marquette County I would say, if possible, go somewhere else. Should you go notwithstanding my warning, be careful never to sit down, except upon a tree, on a fence or behind a haystack. Anywhere else you must encounter one of two miseries—either to squat in a puddle, or to perforate your hinder person with the prickly sand burrs, which are another of the pests of this country, which had nearly escaped my truthful pen.

In saying good-bye, the hardest heart will soften; and it now remains for me to say that I wish Packwaukee a happy and prosperous future. The people are kind and obliging, and their pumpkin pies will always be renembered by me with gentle and kindly feelings. Cakes and various kinds of preserved fruits I have secreted in large quantities about my person; and I am glad to say that throughout all the troubles and trials of my western life my appetite has never failed me. In bidding Packwaukee farewell I have few regrets; and my principal object in writing these notes is to prevent eager sportsmen from coming here to perish. Should an untoward fate ever bring me here again, I shall come clad from head to heel in waterproof clothing, with a life preserver attached to my stomach, a portable canvas boat light enough for rapid transport, and accompanied by a Member of the Royal Humane Society equipped with a complete life-saving apparatus of the latest pattern. Thus guarded, and fortified with a pint of rye whisky per diem, I may a second time add to the sporting literature of the wettest country in the world.

My friend Adrian Corvalli has since visited other shooting grounds and has enived such success that I fear he will re-

My friend Adrian Corvalli has since visited other shooting

My friend Adrian Corvalli has since visited other shooting grounds, and has enjoyed such success that I fear he will return to Wisconsin no more. His description of his week's shooting is slightly melancholy, but I do not think he would have been so miserable but for the unusual height of the water, which greatly increased the difficulties he mentions with such feeling.

The shooting off the bridge really was extremely trying, and I once saw a sportsman get rid of fifty shells for one duck. On another occasion I was building a blind close to an excited Nimrod, who carried a heavy No. 10 muzzle-loader and appeared to be shooting heavy charges. A good many broadbills and redheads were flying over, and this shooter must have fired more than twenty shots without bagging a bird. At last I said to him, "If you wish, I will shoot some ducks for you," and he at once gave me his gun, my own shooting iron being in the house. After a few shots I handed him five redheads, greatly to his delight. Indeed, he was so pleased that he endeavored to slip a dollar bill into my hand as I moved off to complete my blind. I had to explain that I required no reward, and that, like himself, I was shooting only for pleasure. "Stranger," said he, "you are very kind, but please don't tell my partner how I got these ducks," the partner in question being then engaged warming himself at the village. I promised to be silent, and shortly afterwards left him blazing away as wild as ever.

In my western trips I have always observed that nine-tenths of the sportsmen I meet shoot behind their birds, not being able to calculate correctly the speed at which the ducks are moving. One reads a great deal concerning the art of flight shooting, but after many years' experience I do not believe that any rule can be laid down for the successifu guidance of young sportsmen. Practice alone can make a man a good shot, and even then success is not assured, unless the shooter has a clear eye, a steady hand, and a cool head.

In America these qualifications are b

^{*} A localism, meaning a dying or exhausted fish.

non; and as for the practice, Wisconsin, Minnesota and other States will, under proper game laws, afford an endless quantity for many years to come.

I have wandered somewhat from the history of our wet week in Wisconsin, my friend Corvalli having in a measure taken the wind out of my sails. Our bag was a fair one (considering the weather and other difficulties already described with so much pathos), and numbered something over three hundred birds, of which two-thirds were ducks, the balance being snipe, with an occasional quail and prairie-chicken.

On the whole, I think Minnesota about as good a State as the sportsman can visit, and I shall never regret my sojourn in Marquette County, which must always be one of the pleasantest memories of my life.

INGLE-SIDE STORIES.

pleasantest memories of my life.

Ottawa, Canada.

INGLE-SIDE STORIES.

IN your issue of the 22d of December last, you did me the favor to publish "A Tale of Lake Waccamaw," which was not a figment of the brain, but as near an actual occurrence as I could possibly describe it from the relation of one of the parties. The signature which I used, on reflection I have concluded to change, and shall therefore adopt another, which, if not more appropriate, is at least more agreeable to my fancy. My readers must bear with me for the seeming variableness of disposition. Having published the article to which I refer, I trust I shall not scriously offend your good nature if I occasionally write to you either a serious or humorous communication upon such subject as may suggest itself to my mind. With perfect confidence that you will be charitable in your judgment. I now send you a story which I may have told you when I met you when in the city of New York. I do not youch for its truth—but "tell the tale as it was told to me."

In the pleasant month of October, 1877, a party of us, all fond of rural sports, and especially of "listening to the cry that thickened as the chase drew nigh," in the ardent hope that some "antlered monarch of the waste" would pass our "stand" within easy range of our guns, met by agreement at the "Mineral Spring," twelve miles distant from my home, fully prepared with guns, dogs, and three days' rations, for a hunt after deer in the pine lands of that section of country. Instead of a tent, we occupied a summer house, which was supplied with bedding and all needful furniture. We sat in chairs, around the "ingle, blinkin' bonnily," and perfected our arrangements for the morrow's sport. Each had spun a yarn of successful hunting—sonetimes greatly colored, as is not unusual with sportsmen. Each had told his tale of bringing down a buck at marvellously long range, describing with great minuteness the superb hunting and takeking of old Beave, and Spot, and Trim, and Loud, their "deep-mounted bay soundin

"And echo sprang up from her home in the rock, And seizing the perishing strain, Sent the gay challenge with shadowy mock From mountain to mountain again."

A heavy leap in the darkness, a stumble, a struggle, and stillness showed that the aim was exact and the weapon had done her work. In great joy, the successful sportsman went to the spot where he expected to be greeted with a sight most dear to hunters.

"But mortal pleasure, what art thou in truth

"But mortal pleasure, what art thou in truth?
The torrent's smootlness, cre it dash below."

Instead of the prostrate form of a deer, he beheld in mortal agony a young colt, whose eyes had deceived him into a fatal mistake, and made him the unwilling destroyer of what might have become the "gallant grey" of some James Fitz James of the river country. "To hide his sharue from mortal eye," the unfortunate night-hunter suggested to his companion that the colt be dragged to the river and thrown into its gurgling waters. So the old gun was laid down, the light was extinguished, and the two entered upon the laborlous close of a too successful adventure. Just as they had reached the bank of the river, bathed in sweat from the unusual exercise, and had rested a few minutes, preparatory to the plunge which they hoped would remove all evidence of their mishap, "the morn in russet mantle clad, walked o'er the dew of the eastern hills," and by its light "old Cap. Joe," discovered that the victim was his own property.

At this point in the narrative, another and deeper yawn from your correspondent was answered by one of his companions, who said that the story reminded him of another case of mistaken identity, which occurred during the preceding year, not lifty miles from where he was then sitting—but the animal was very unilke a deer, but ruseh like an animal which serves a valuable purpose in agriculture, though his name is suggestive of a great lack of wisdom. He begged that he might be allowed to narrate it. Your correspondent, upon the promise being given that this should be the last for the night, gave his reluctant consent, and George R. proceeded with great humor to tell the following, which he averred to be a face—"he'd be blamed if it wa'n't."

During the year 1876, there lived in the adjoning county a young fellow named Cambyses Day, who clitted and published one of those weekly (or weakly) luminaries which are resplendent all over the land, called the Swimborough Gag-us. On a certain day he started out on a colle

most sanguine expectations," and having an unusual supply of money, very philosophically concluded that such good fortune entitled him to all the joys of a liberal treat of repeated nipperkins of whisky and water, for which he had an unfortunate and somewhat ungovernable appetite. Whenever he had the wherewithal, or some friend remembered him when he was about to "quench his raging thirst," Cambyses rarely failed to dizzy his brain and unsteady his steps. He now not only treated himself once, but so often that his body became too heavy a load for his legs to carry, and they refused to perform that intended duty. He dropped down in an alley and lay unconscious of the affairs of states and nations for hours, until the stupor had sufficiently worn off to enable him to resume a somewhat tottering locomotion.

and nations for hours, until the stupor had sufficiently worn off to enable him to resume a somewhat tottering locomotion.

The sun had nearly robed himself ready for the rosy couch of the earth, when Cambyses rose and started off staggering, to get his last drink for the day. Confused ideas of newspapers, and subscribers, and advertisements "roamed through his noddle," and as he was passing the northeastern corner of the temple of Justice, commonly called the Court House, he espied in the gloaming what he took to be a man, and forthwith directed his energies towards the accomplishment of his darling but confused ideas of extending his business. Approaching within a few feet of his fellow being, with a hiccup which plainly indicated his intellectual and physical condition, the knight of the quill thus proceeded to work: "Devenin', sir! Wan' do dake bes' baber ever bublished? Foll of infrantion an' 'telligence. Won't 'vi 'scribe? Dollar a year. Ladest news from all barts of worl'. Wat's your business? Adv'tise any ovill git rich. Lawyer? Adv'tise in Buyus and you'll git cases. Doctor? Adv'tise and beeple will send for you. Shoemaker? Adv'tise and you'll git work. You don't know nothing—don't read papers. You ain't heerd of the — scandal, and the Fort Still business, and you don't know this is Stennial year, and they've got a big show at Philadelphy. Well, if you won't 'scribe, I'll give you a paper, you blamed fool." So, pulling a copy of the last edition from his capacious pocket, he formally presented it with a vigorous gesture to his illiterate friend, remarking: "Take it, read it, and you'll know everything." Cambyses had to get further, answered the friendly offer by a loud but despairing Yave-hoo-yave-hoo. The appreciative listener was nothing but a little mule, which a darkey had ridden to the town in the morning and hitched by a rope to a small ailanthus bush, which grew from the corner of the Court House. The answer brought for the first time to the befuldled mind of Cambyses that his auditor, though ex

blamed long-eared fool."

And then, teller and listener all hastily disrobed, lay quietly down upon couches which were luxurious, and before many minutes had elapsed, your correspondent was serenading his companions with snorous music, which "made night hideous," and which they were uncharitable enough to say were not quite equal to the harmonious notes of the Chinese gong when it announces that dinner is ready for a hungry guest.

PINE WOODS, N. C., January, 1882.

RANDOM SHOTS FROM MEXICO.

RANDOM SHOTS FROM MEXICO.

6 PEAKING of cannon," as the man said who stamped his foot on the floor at a public dinner, with the remark that a noise like that suggested a story about guns, reminds me of a little shooting experience I might have had in Mexico. The first room I had in the City of Mexico was on top of a roof, and was loopholed like a fortress. To my great joy, I found it was considered the unsafest position in the city, and that it was a week to be remembered when that room hadn't been robbed. It was a source of satisfaction to me that I was in a measure prepared for robbers. Before going to Mexico I had perfected myself to that degree in pistol-shooting that when I pulled the trigger I generally hit something. Acting upon the advice of a friend, I went out into the country, and sticking a card—one of the circular variety—up against a snow-bank, commenced to perforate it full of holes. Some-how, it didn't perforate worth a cent, though I finally succeeded in making several holes in the snow-bank. By drawing rings about the card, and gradually restricting their diameter, I hoped eventually to get down to the center and knock the spots out of that card every time. But after going into the country many times and spending much money for cartickets and cartridges, I had only succeeded in getting within ten feet of the card.

There must be something wrong with the revolver, and I took it to a friend, a noted pistol-shot, for him to examine. He took me down to his private shooting gallery, requested his secretary to hold up his segar between his fingers, and at ten paces shot the ashes from that segar, which the secretary colly placed in his mouth and went on smoking. Then he stuck a "nickel" in the cork of a demijohn and knocked it of time after time. Handing the revolver to me, he remarked: "This is as good a pistol as any I have in my collection; now you try it." I wanted his secretary to hold up the segar and let me shoot off the ashes, but he said he "wasn't holding up segars any more that morning,"

but I did. Men high in authority here warned me not to attempt the ascent alone, and assured me that only my skill as a pistol shot would save me from extermination. Very fortunately I was not called upon for an exhibition of that skill, and have not added, nor have the means of adding, another of those black crosses to the large number that line the waysides all over the country.

externmation. Very fortunately I was not called upon for an exhibition of that skill, and have not added, nor have I been the means of adding, another of those black crosses to the large number that line the waysides all over the country.

There is abundant cause for alarm, or there has been, as the crosses above mentioned testify, but the danger to truvel here is grossly exaggerated. In my trip to the volcano I did not see the slightest indication of danger, though I went unattended by any English-speaking companion, was gone three days and two nights, and travelled through the pine belt below the snow-line after nightfall.

I am free to confess, however, that I then thought a revolver on the hip better than two at home.

At first glance there may not appear to be any connection between a volcano 18,000 feet high and a reception in honor of Gen. Grant, but I established such a connection after leaving the crater of Popocatapetl. Reaching Mexico at 7 in the evening, at 10 I found myself surrounded by others of my species in white kids and "swallow-tails," while others of the same species, but of different sex, floated before my astonished eyes in fluffy clouds of lace and muslin, and in silken robes, that made up by the length of one can for what they had lost at the other. In the language of the reporter of the evening: "The company was one of the most distinguished and elegant." Gen. Grant, as the guest of the evening had a place assigned him, with his wife and niece on either side of him, but he soon got restless, and moved about chatting with the guests. What particularly delighted me was to infine that had been up Popocatapetl; here, at least, we met on common ground. "It was," said he, "nearly 34 years ago, in 1847, that a party of us rode up the mountain to the snow line, and, after passing a miserable night in a roofless shed, climbed up the cone." That was at a period before your correspondent had begun to think of climbing mountains, but we compared notes, and found that the old "hill that smokes" had

sat down to the fight at one o'clock, and for four

menus.

We sat down to the fight at one o'clock, and for four hours the battle waxed and waned; one by one the outworks of the enemy were carried, one by one they fell before us until we had waded right through that luscious bill of fare. Nor lack was there of speech to edify, and music to encourage us. One by one the musicians straggled in—the horn, the harp and the big bull fiddle—until the air above was resonant with harmony that drowned the gnashing of teeth below. The band was in the gallery.

The "Tivoli San Cosme" is one of the lovellest of these gardens for feasting and pleasure that adorn the suburbs of flowers, little kiosks and rustic retreats. The air was fragrant with the odor of flowers and alive with the music of birds; the day was one of the perfect ones that Mexico gives so often, in requital for her many other defects, and the bright sun and cool breeze acted conjointly in producing automosphere electric and bracing. In the great hall, hung with garlands and displaying that profusion of flowers for which Mexico is famous, the tables were spread.

Ranged down the tables, right and left, were the ninety guests, scurce a man among them without a title. There were ministers, congressmen, counts, generals and colonels, but there was nobody of less degree than a captain. Titles were the order of the day, and, when some one, casting about for a handle to my name, called me professor, I did not resent it as I ought.

All this is now but a reminiscence; but the memory of that banquet still remains, to cheer me when the larder is low and the wolf howling around the door.

OBER.

SOUTHWESTERN TEXAS.

SOUTHWESTERN TEXAS.

THE International Railroad of Texas, by way of Austin and San Antonio, has recently been completed to Laredo, on the Rio Grande, and is now being built onward to the city of Mexico, this road and the Texas and Mexican Railway from Corpus Christi to Laredo also being extended to various points in Mexico; also the Sunset road from San Antonio northwestward to El Paso, with a branch to Eagle Pass on the Rio Grande. This last road, it is said, will be finished to Eagle Pass the present winter. These railroads, mostly built in 1881, have rendered easy of access a fine region of prairie and woodland, river and stream in Southwestern Texas. Here deer and wild turkeys abound, also three or four species of quail or partridges; also, in the winter, wild geese and ducks. I know this, having spent a large portion of the summer and fall in Southwestern Texas, botanizing and also in getting wood specimens of the trees peculiar to that region for the American Museum of Natural History in Central Park, New York, and also for the Department of Forestry of the United States Census Bureau. I will tell more about the trees in a future article, for many of them are little known even to botanists.

Southwestern Texas is a much more fertile and attractive region than is generally supposed. Its dry climate and prairies covered with mutritious native grasses have made stock raising the principal business of the inhabitants, who have locks of sheep, herds of cattle and horses numbered by the thousand, and lands fenced of many thousand acres. This business has been and is very profitable; large fortunes have been made and are being made by it.

The country is level or gently undulating, with hill and valley, all gradually rising from the Gulf of Mexico northward, San Antonio and Austin being about 500 feet above the sea, and the hills of the cretaceous rocks in the vicinity and north of these places are 1,000 or more feet higher. Austin westward, via San Antonio and Fort Clark to Eagle Pass,

the line is near the southern boundary of the cretaceous rocks

the line is near the southern boundary of the cretaceous rocks of Texas, south of which is the tertiary formation.

It is a health-giving region, especially to those having lung complaints. Here there is pure air, with cool breezes from the Gulf of Mexico in summer. The days of winter are mostly bright and clear, seldom too cold to make exercise in the open air unpleasant to the invalid.

All sportsmen and invalids who love hunting or the study of nature in its varied forms, especially botany, entomology, ornithology or zoology, can find here a country which will be apt to give them health, also much pleasure and useful knowledge.

It is important that those who have diseased livers or lungs

nowledge. It is important that those who have diseased livers or lungs

or throats should have some pleasant employment when exer or throats should have some pleasant employment when exer-cising in the open air to divert their minds from the thoughts of disease. This is why the sportsman's life is so healthy; and still more so are the studies of nature in the field, for they can be pursued and enjoyed anywhere in the country. But new fields are best for all, hence the superior advantages of Southwestern Texas.

AUSTIN. TEXAS. January, 1882.

The Fort Clark News, Kinney county, Texas, says: "We learn that the Keene boys recently killed forty-two deer in five days. Pretty good sport for the time spent. It seems almost cruel to ruthlessly kill the animals for no other purpose than that of securing their skins," The Henrietta Shield, Clay county, says: "Mr. P. A. Brown, from the Little Wichita River, brought into town a splendid lot of wild game Tucsday. There were three fat turkeys, a dozen squirrels, a lot of cotton-tails, an opossum, three or four varieties of ducks, some quail, and half a dozen kinds of small birds. They were all nicely dressed and as fat as butter balls."

balls."

For the information of your readers I will add that Kinney county is the third county west of Bexar county, of which the city of San Antonio is the county seat. A railroad now runs from San Antonio direct to Fort Clark, and will soon be completed to El Paso on the Rio Grande, and thence to San Francisco. A railroad also runs from Denison, west to Gainesville, where a daily stage runs to Henrietta. Most of the Little Wichita River is in Clay county, and the country in both Kinney and Clay counties is mostly open prairie and easy hunting grounds. The string of Mr. Brown shows the splendid variety of game to be found here. He probably retained his venison for family use.

I hunted over these grounds in 1852–3-4-5, when game was very abundant, and I see there is much there yet. For the information of your readers I will add that Kinney

Matural History.

DAVE.

NE day in June last a friend whose business calls him

DAVE.

ONE day in June last a friend whose business calls him daily to the woods, and who thinks that about the smartest trick in the world is to get a joke on an editor, brought to the sanctum a something or other, and went his way. We examined the donation and decided at once that it was a bird. We claim considerable credit for that decision, for not a sign of feather or wing did it show. A ball or lump of pure white down, with eyes and a bill on the top of it, and claws on the bottom of it—that was about all.

We took the nondescript home, and it was at once adopted by the boy, who has a boy's turn for pets of all kinds. In fact I may as well admit that the queer little bunch of fuzz won the affections of the whole family from the start. It had a clumsy way of walking on its elbows, and a bright intelligent look out of its large eyes that were quite taking. It did not take Dr. Coues' "Key" to decide that it was some kind of a hawk, but what kind was an important question if we wanted to "raise it by hand." What would it eat—fish, flesh or fowl? A thrist we feared it might be a fish-hawk, and were greatly relieved when it accepted bits of fresh meat. But the next day when some minnows were brought in by a boy who heard that we had a fish-hawk, we were chagrined to see Dave gobble them down as fast as they were offered. We soon lost all confidence in these signs, for we found that fresh meat, birds, mice, toads or fish, were equally welcome to the young gourmand. And how he grew. In three weeks he was full feathered, and in three weeks more reached his adult size and strength. Then we were able to determine his species, and found that we had tamed a pigeon-hawk, and that his proper title was accipeter fiveus, although we always called him Dave, for the friend who brought him in. During the summer Dave went with us to our summer home, and it was about all the boy wanted to do to catch fish and other food enough for him. He was tamed, or more nearly tamed than we had ever supposed a hawk could be. We kept him te

FOREST AND STREAM, and hunting up my last volume I soon had my eye upon these words: "Particular pains taken in mounting pet birds." That was the man for me. No common skinner, who makes a living by dressing skunk hides or putting up birds for the milliners, could have had the job; but a man who has judgment enough to advertise, and delicacy of feeling enough to take "particular pains with pet birds," he is our man. So we expressed the remains to New York, and now, as we write this, with the family all around us, there sits Dave on the top of our desk "just as natural as lite," only he doesn't chirp. I have seen some good work in that line (have done some myself that I am not ashamed of), but when I remember what a mangled bloody bunch of hawk I

sent to New York, I feel like saying that Dave presents the best specimen of taxidermist skill I have ever seen; and that I firmly believe if anybody could make that bird twitter again, Fred. Sauter, the naturalist, of 199 William street, could do it.

T. B. A.

STRANGE HABITS OF BEAVER.

STRANGE HABITS OF BEAVEH.

I WAS greatly surprised, two months ago, on entering a trapper's camp in the White River bottoms, about cighty miles from its mouth, to find several fresh beaver pelts hanging up. I asked the trapper where they came from. He answered "I cotched'em round hyah." Now, as this camp was several miles from any high-hand, and as the country all around for at least five miles overflowed from one to twenty feet in depth, usually as early as February, I thought it a very queer place for beavers to inhabit. I got all the information about them from the trapper that I could, and found him a very skillful trapper and quite an intelligent and very observing man. He had trapped for beaver in the Northern States and in the Rocky Mountains. When he came here no one knew of there being such a thing as a beaver in the coun-

feet in depth, usually as early as February, I thought it a very queer place for beavers to inhabit. I got all the information about them from the trapper that I could, and found him a very skillful trapper and quite an intelligent and very observing man. He had trapped for beaver in the Northern States and in the Rocky Mountains. When he came here no one knew of there being such a thing as a beaver in the country. But when trapping in the bottoms he found quite plentfully many unmistakable signs of beaver, namely, where they had cut down trees, their tracks, etc., but no dams or houses. He set his traps in the regulation style to catch beaver, and "cotched" them, sure enough. I asked him how and where they lived, and how they managed in the long overflow, lasting often from the last of January into June. His opinion was that when there was no overflow they lived much as otters do, namely, in burrows in the ground, or rather houses hollowed out in the steep banks of the lakes and bays, having no place of ingress or exit except under the surface of the water below low water mark.

These lakes and bays in the bottoms of the lower White River are peculiar. The larger of them are undoubtedly old river beds, or channels, where the White River has once flowed; others—the smaller—have been scooped out by the river when rising rapidly, when there is no back water from the rivers below, flowing across the bottoms with a strong current. The larger and some of the smaller of them are usually deep, their bottoms on a level with that of the river. which is a deep stream and filled the year around with clear, comparatively cool water. They swarm with black bass and other fishes. Here, then, the beaver has assumed habits suited to his surroundings. He dams not for fear he may be dammed, or rather he don't "haf to." He stores up little or no supply of winter food, for the door of his house is seldom closed by ice. He builds no houses, for the reason that, good architect as he is, he could not build them high enough to get out

good one-assimmed deaver, also that there are beaver at many other points in this State.

Deer, bear, turkeys, ducks, geese, squirrels, raccoons, opossums, quail, prairie chickens and rabbits are very plentiful here at present, and large bags and fine sport can be had. The weather has for the most part been fine, warm and dry, but just now we are having a wet spell, and the streams and rivers are "going on a high."

BYRNE.

CROCKETT'S BLUFF, Ark., 1882.

THE WORK OF EARTH WORMS.

THE WORK OF EARTH WORMS.

A NGLERS have usually looked upon earth worms as chiefly valuable for fish bait, but Mr. Darwin *tells us that they change the earth's surface, swallow and bury rocks, fill up valleys, and that they have buried ancient cities, and finally, that the upper crust of the earth has passed through their bodies. Further, that this low order of beings, although blind and deaf, possess some mental powers and much muscular strength. By extensive observations and many experiments, Mr. Darwin seeks to substantiate these claims. It has been the custom of some religionists to take the worm as the type of humility, and to call themselves "worms of the dust." If Mr. Darwin's estimate of the geological importance of these creatures be correct, perhaps it will be necess

the dust." If Mr. Darwin's estimate of the geological impor-tance of these creatures be correct, perhaps it will be neces-sary to look still lower in the scale of creation for a compari-son, even to the Protozoa possibly. Shakespeare seems to have anticipated the importance of the worm—he makes Hamlet say:

"Your worm is your only emperor for diet—we fat all Creatures else to fat us, and we fat ourselves for maggots."

I believe it is a fact, well-known to anglers at least, that in North America there are no earth worms in the wilderness. Only in cultivated ground, like old fields and gardens, can they be found. I have searched for them in vain in the woods and on the prairies, in the Adirondack wilderness, and in Canada, in Maine and in Florida, in Georgia and in Colorado; and I have never found them except in long cultivated grounds.

grounds.

In Chicago, in 1840, earth worms were only to be found in

The Chicago, in 1840, earth worms, were only to be found in an old garden attached to the Fort.

When it is asserted "that long before man existed, the land was regularly ploughed by worms," this may be correct as regards England, but that island is but a speck on the map of the globe.

If, as we are to infer from this book, the business of earth

*"The Formation of Vegetable Mold through the Action of Worms, with observations on their habits." By Charles Darwin, D.D.D., F.R.S. New York, Appleton & Co., 1882.

worms is to fertilize the earth by passing it through their bodies, why do they only follow in man's footsteps? Why do they not operate in new soils, and prepare them for human upation:

occupation?
To criticize any theory of Darwin, may be considered by his disciples as great presumption, and to dissent from him rank heresy; but that seems to be a connection between earth worms and the dung heap, which has not been noticed in this volume of three hundred pages.

ENEMIES OF GAME BIRDS.

ENEMIES OF GAME BIRDS.

Editor Forest and Stream;
In your issue of Jan. 26, I notice you seem to doubt my assertion about the sharp-shinned hawk and sparrow hawk, and give the impression that my statement is an opinion only. Now I will go into more particulars, as I seem to have failed to convey clearly before that I knew them to be dangerous to quail. I saw twice on my late trip, while quail shooting, the sharp-shinned hawk with a full grown quail in its clutches barely able to fly, in fact unable to rise above a foot or two over the ground on account of the weight of the bird. The man with whom I was shooting also saw it and we killed them both. The balance of the quail were badly frightened and scattered all over the field. I noticed every day these small hawks hunting out cover where I knew the quail lived. I was told there that both these hawks were exceedingly troublesome and bold, and would kill a half-grown chicken—that they were, in fact, the most troublesome hawk they had, being so small and quiet they had an advantage over the larger kind and were better able to surprise their prey. They considered that 100 quail a year was about the average each hawk killed. This, of course, is mere conjecture.

The English snipe I spoke of was a full-grown bird, killed in the open meadow in full view of my friend who shot the hawk which proved to be a sparrow hawk. I have only to add that I have spoken to several good sportsmen and naturalists on the subject, and they agree with me entirely.

We fortainly did fail to understand

W. HOLBERTON.

[We are glad to receive the above interesting particulars from Mr. Holberton. We certainly did fail to understand him as doing anything more than expressing an opinion. Facts and details are required in matters of this kind, and these we now have. It is hardly necessary for us to say that if Mr. Holberton had told us that he knew the small hawks were dangerous to quail we should have accepted his statement without a word.]

DECREASE OF GAME BIRDS.

NORTH BLOOMFIELD, O., Jan. 24, '82.

Elitor Forest and Stream:

I have read with regret the various articles that have appeared of late in Forest and Stream, regarding the growing scarcity of ruffed grouse throughout the land. I was well aware that their numbers had been rapidly diminishing in these parts for some years past—but had hoped for better things elsewhere.

I see some of your Eastern correspondents attribute the scarcity of grouse in their localities largely to the tick, and give reasonable proof of it. Others think the red squirrel is playing the mischief. But I very much doubt if either are in any degree responsible for their scarcity in this vicinity. It is true an occasional tick is to be found on an old bird; and although I have shot several hundred during the past few years, and probably seen as many more that have been killed by other guns, I have yet to see the first one not in prime condition, and have only heard of one. Nor have I reasonable grounds for thinking either the tick or red squirrel molest the young in this country—but the very best reasons for assuming the contrary.

The unmerciful manner in which our grouse have been trimmed by resident and non-resident sportsmen during the past few years is, I think, the principal cause of their present scarcity with us.

Foxes, cats and skunks are all more or less destructive to

past few years is, I think, the principal cause of their present scarcity with us.

Foxes, cats and skunks are all more or less destructive to all ground-roosting birds; and long protracted storms during the nesting season. I think, contribute not a little to the destruction of very young broods—particularly along river bottoms and on low ground, and I have the very best of reason for thinking our freshet which came in the early part of last June cost us many a brood, as young birds were seldom met with later than that, or during the shooting season.

Another thing that stands greatly in the way of any rapid increase of our noble game bird is the fact that a very great majority of them are not of that gender that could reasonably be expected to devote any great portion of their time to family cares, preferring as it seems during the entire summer and early fall to give themselves up to meditation, and caring only for their lordly selves.

Still, regardless of their natural enemies and unfortunate hindrances, I think a little prudent care on the part of our sportsmen would enable their numbers to so increase as to give us an occasional fair day's sport for some years to come, providing the pot hunters only confine themselves to other territory, but so long as they continue to overrun ours, there is little encouragement for us to do other than make it as discouraging as possible for them.

BUCKEVE

White and Gray Rabbits—Cortland, N. Y., Jan. 20, 1882.—A party from town a short time since came back home from a rabbit hunt, bringing with them six white rabbits. This is quite remarkable these days, as it was supposed the old-fashioned white rabbit was nearly exterminated in this section. Please inform me by what means the gray rabbit deposes or is the means of driving away the large white variety.—Mro. [Does it do so? We have found both species abundant in Massachusetts in the same localities. The larger species is the more boreal in habitat of the two, and gradually replaces it as we proceed further north.]

Chows as Nest Robers.—I know from personal observation that the crow is a merciless thicf and will rob any other bird's nest it can find, of either eggs or young, which they carry away to their own nests to feed their young on. During their nesting season the crow may be seen almost any time of day stealing noiselessly about searching for the above food. Now and then he is seen for a moment gathering or hovering over a certain place and to fly rapidly away. An examination of the spot will usually reveal an empty and torn nest. So it is true that the crow will destroy a whole broad of birds at once, and I believe that a reward or bounty should be offered for their heads.—G. W. E.

THE CONFUSION in the FOREST AND STREAM office, caused by the fire last Tuesday morning, has caused some necessary interruption of the smooth routine of the paper.

Game Bag and Gun.

THE MICHIGAN ASSOCIATION.

THE SEVENTH ANNUAL MEETING HELD AT EAST SAGINAW, JAN. 17 AND 18. FULL REPORT OF A VERY INTEREST-ING AND PROFITABLE MEETING.

THE Seventh Annual Meeting of the Michigan Sportmen's
Association was held at East Saginaw, on Thesday and
Wednesday, Jan. 17 and 18, and was well attended, and great
interest was manifested, notwithstanding the fact that the
Legislature does not meet this winter, and it being what
might be called the 'off year' was expected to have an effect
to reduce both interest and attendance.

TUESDAY MORNING SESSION.

Tuesday morning session.

The convention met in the Common Council rooms, and was called to order by the President, Dr. E. D. Holmes, of Grand Rapids, who expressed his pleasure in seeing present so many friends of game protection and true sportsmanship, and complimented the association on the straightforward manner in which it had since its organization adhered to the objects of its formation, the protection of game and fish, The President compared the meetings of this association with the annual meetings of some other State association wito the annual meetings of some other State association wito the annual meetings of some other State association wito the annual meetings of some other State association wito the Annual meetings of some other State association wito the Annual meetings of some other State association wito the Annual meetings of some other State association with the shooting for money and prizes, while any action in the direction of a better protection to fur, fin and feather seems entirely forgotten. An association was considered a great experiment at its organization, but the infant had steadily grown from weakness to a healthy maturity and acknowledged influence, and this he attributed very largely to the fact that trap-shoots and pigeon tournaments were rigidly ruled out from the numual gatherings. The President hoped the present meeting would be equally prolific in wise counsels and good results as its predecessors, and closed by appointing A. H. Mershon, A. J. Keeney and R. Mudge, committee on credentials. On motion, the report of committee was deferred until the afternoon session, and the meeting adjourned until 2 P. M.

TUESDAY AFTERNOON SESSION.

After reading minutes of previous meeting, the committee on credentials reported clubs represented as follows:

Central City Sportsman's Association, Jackson—S. Edward Rogers, Mayor Cyris W. Highy, George Colley, Nelson W. Burkhardt, George F. Shurwood, Sportsman's Chib, Grand Rapids—Dr. E. S. Holmes, Dr. J. C. Tacker, George A. Gould, Hastings Sportsman's Club, Hastings—Royal Madge, W. R. Geer, Bay Point Shooting Club, Erie, Monroc County—A. J. Keeney, Levi Morrip.

Bay Fome Shooting Club, Erie, Monree County—A. J. Keeney, Levi Morrin.
Saginaw Sportsman's Club, Saginaw—E. J. Peek, E. N. Driggs, E. R. McCarty, R. J. Birney, James Jerome.
Becarty, R. J. Birney, James Jerome. East Saginaw—A. H. Morshon, J. R. Levingston, D. R. Esterney, E. Renington, H. B. Roney, Bay City Shooting and Fishing Club, Bay City—C. L. Collins, F. H. Holly, F. L. Westover, E. Q. Ingersoll, R. P. Gustin.
Battle Creek Sportsman's Association, Battle Creek—N. A. Osgood, Mayor E. C. Nichols.
Pt. Moullie Shooting Club, Detroit—E. H. Gilman, Howell Game Club, Howell, Mich.—Chas. G. Jewett, Henry D. Wiber, D. R. Rupert, E. F. Mulliken, H. B. Blackman.
Howell Game Club, Cheyboygan—Chas. J. Kitchen, W. S. Herbyboygan Game Club, Cheyboygan—Chas, J. Righporne, B. Righpornel. Cheyboygan Gamé Club. Cheyboygan—Chas. J. Kitchen, W. S. Humphrey. Hart Sportsmen's Club—L. G. Rutherford, E. D. Richmond. Bay County Sportsuen's Association—Judge S. T. Holmes, Mayor J. H. Wilkins, E. J. Carrier, Senator C. F. Gibson, C. C. Fitzhugh.

H. WHIGHS, E. J. CHTPET, SCHAUP C. F. GIOSON, C. C. FREIDIGH.
Individual members of the Association were elected as follows: E. Q. Ingersoll, Bay City; S. E. Rogers, Jackson; Lafayette Owen, Detroit; James Slocum, Detroit; Frank Eddy, Detroit; W. H. McGraw, Detroit; W. J. Mason, Patenatic

Eddy, Detroit; W. H. Species, Detroit, By Mr. Rogers: Resolved, that each delegate and member of this association present at its deliberations be entitled to one vote. Carried.

of this association present at its deliberations be entitled to one vote. Carried.

Mr. Keeney suggested that the delegates present be called upon for a report of their success in enforcing the present game laws, in their immediate neighborhood, the past year.

Mr. A. H. Mershon, President of the East Saginaw Game Protection Chib, spoke of the prosecution in Clare County, in which a sympathizing jury refused to convict on the ground that the deer might be a tame one and was not proven to be wild. He thought the agitation practically stopped the illegal shooting of deer for five or six weeks, thus giving the fawns a chance for their lives, and had stopped a large amount of wanton slaughter. He thought more could be accomplished by conciliation and trying to instruct the settlers as to what was to their best interest, than by rigid enforcement of the law without regard to the family necessities of the settlers, many of whom are homesteaders and very poor, and have to kill a deer occasionally to keep their families from starving, and he knew the association would not favor prosecution in such cases.

kill a deer occasionally to keep their families from starving and he knew the association would not favor prosecution in such cases.

Inasmuch as juries in the thinly settled parts of the State have to be drawn from saloon bummers and hangers on, who will swear to anything to prevent the execution of the law, as in Clare county, conviction was very difficult. He thought the new law was all right, but needed effective measures provided for its enforcement; also believed that if the destruction of fish spawn could be stopped, it would accomplish more than to make close seasons for fishing.

Conductor Cate, of the Mackinaw Division of the Michigan Central Railroad, reported no prosecutions at Bay City, and fewer violations than at any time for ten years; fewer violations in the sections through which the road runs than even before, and no shipping out of the State that he knew of, all freight agents on the Division being instructed by the Superintendent to know what was in all boxes and packages shipped during the game season. He said the inhabitants were as a rule much pleased with the new game law and the association's interpretation of actual settler's "rights" in killing game for their families during the close season, and seemed more than ever disposed to respect the game law. He thought the practice of "shining" deer on the Au Sable and Manistee rivers had also greatly decreased the past year.

President Holmes said the railroads centering at Grand Rapids were all in favor of the law as it is, and would not violate the shipping clause, several of the railroad officials being membess of our eight there, and heartily with us. He thought there would be no trouble with common carriers, and anticipated no difficulty in preventing the illegat shipment of game over any of the regular lines.

Mr. Jewett, of the llowell time Chub, said their club had set vigorously to work since its organization three years ago to enforce and create a respect for the game laws; that, as, and anticipated no difficulty in preventing th

year of vigorous prosecutions a great change in public sentiment began to take place, people saw the club were right and rallied to their support, and the past year there had been scaracely any violations of the game law. The farmers' boys and country people generally in his section, he believed, were observing the law, for which he gave the State Assocition credit in having procured the present law and organized its auxiliary clubs.

Mr. Higby said the law had had a like good effect in the vicinity of Jackson; that their club had met with the same opposition at the start; but when the farmers came to see the good effects of the law and to understand the motives of the sportsmen, their opposition had ceased.

Mr. Humphrey, of the Chicago Gun Club, regretted the violations which were going on constantly in his section of the State, but as they were almost wholly by settlers with large families to feed, he had not the heart to prosecute them, and should not do so. He thought the practice of catching live deer on the snow crust and tying them up an outrage which should be summarily dealt with, as the deer invariably died. One man had eight tied up in his barn alive, and all died. These men claimed they knew of no law for the protection of game. A justice of the peace fined them one dollar and costs each and let them off. Killing out of scason by laxy vagabonds goes on daily, but it is almost simpossible to catch them at it, and it was a difficult problem for the club to deal with. The deer in Northern Michigan were rapidly becoming extinct, and were much scarcer this year than last. Five out of every six deer caught in Chephogan county were does, and five out of six of those does were found to have twin fawns within them, and the wanton slaughter of deer was very great. Other delegates recited their experiences, all going to show that the work of the State Association was having its effect, and that a great change in popular sentimen was going on all over the State.

Secretary Mershon the read the following letter

Form of Lac, Wis., Jan. 4, 1882.

W. B. Mershon, Secretary Michigan Sportsmer's Association:
It affords me pleasure to acknowledge your favor inclosing the notice of your annual meeting on the 17th, and to assure you that it would be a great satisfaction to accept your contial invitation to be present.

While I am unable to do this, I desire to congratulate you on the noble and progressive course of the Michigan Association, and have reason to believe that there will be no abutement of the zeal manifested in former years.

As the especial attention of your coming meeting is being directed to the enforcement of your laws, it may not be uninteresting for me to state that your non-export law worked grandly in the upper peninsula last season, and was the means of saving more deer than all other statutes combined.

No doubt instances of flazrant yieldflows can be added.

the means bined.

No doubt instances of flagrant violatious can the great throng of poachers have been restrained by trus restriction.

Your association is under lasting obligations to the Northwestern Railway management for the effective manner that has characterized the enforcement of the law.

From personal correspondence with the attorney of the road, and repeated inquiries at different stations on the line, I was fully satisfied the management seconded your enactments, During my stay in the woods last senson, I met the same old parties of gentlement sportsmen from other States, and while many of them would have enjoyed carrying out a saddle of venison of their own dressing, they freely admitted that the sports of the forest were sufficiently enhanced by the conspicuous absence of the meat hunters to make the restriction preferable.

State, Wisconsin, has suffered in consequence, as

sports of the forest were sufficiently enhanced by the conspicuous absence of the meat hunters to make the restriction preferable.

My own State, Wisconsin, has suffered in consequence, as the great crowd of hunters has congregated on our soil to slay, ship and sell without restraint.

Our State Association of last year is responsible for the wholesale destruction that has been carried on instead of emulating the conservative spirit that has governed your deliberations, a repeal of our non-export law was recommended and secured on the grounds of unconstitutionality, January 1st.

Perhaps this may be the reason why the association seems to have gone the way all things that have lost or outlived their usefulness, after having secured the repeal of the most salutary means for protection conservative sportsmen had been able to place on our statutes.

I carnestly hope that not many years will intervene until Wisconsin shall again stand with Michigan, and insist with you that the destruction that now has no restraint shall have a limit, and that the pine clad hills of the north shall not continue to be a wast claurel house for the wandering tribes of all nations and tongues. Yours,

Richland, Mich., Jan. 10, 1882.

all nations and tongues. Yours,

L. M. WYATT. (Secretary-Fond du Lac Game Club).

Br. Holmes—Your kind letter of vesterday was received this evening. There are a few simple changes in the laws relative to fish and fishery interests which ought not to have taken any time at all to amend in our Legislature. For instance, the law requires all the natural fishways of the State to be provided with fish ladders where the fish ways are obstructed by dams. There is no provision in the act of 1877 to prevent the capture of fish at the entrance or exit of these ladders, and I do not know of a fish shutten the State where men and boys are not in the constant practice of the capture of fish in their immediate vicinity. The law passed in 1865, requiring all persons engaged in the catch of white fish carefully retain the spawn of the tish during the spawning season, makes no mention of the fortilization of the eggs. Perspaps in 1865 it was not understood by the auther of the bill that this was a necessity. I have endeavored to have some small changes like the aforenance perfected, but without success. Canada and the State of Olio have a close senson on white itsh; and there should be a uniform law on this most important subject, but if we cannot tithe unint, annis and cumping. I have little hope of perfecting the weightier matters of the law.

My friend Thos, L. Cohb, of Kalamazoo, wrote me as few.

min, I have little hope of perfecting the weightire matters of the law.

My friend Thos, L. Cobb, of Kalamazoo, wrote me a few days ago with the request that I prepare a paper to be read before your association at East Saginaw, the 17th insts., to which I replied that I had prepared a paper on "On the Introduction of the German Curp," which was read at a meeting of our Board in Detroit two weeks since, but not published, which was read at an eneting of our Board in Detroit two weeks since, but not published, which I would reproduce if desired. I have been necessarily absent from home in the interest of the fisheries this fall and winter so much that it will prevent the pleasure of my acceptance of your kind invitation to attend the State Sportmen's Association's annual meeting at East Saginaw next week, but will send in the paper, which you can use if you see fit. Very truly yours,

Elia Miller. (Fish Commissioner.)

Paris, Mich., Jan. 17, 1882,

PARIS, Mich., Jan. 17, 1882.

Dear Friend Holnes:

I send you the enclosed paper just as it came from my hand, as I am too hosy and tired to revamp it.

I am too poorly to join in your happy gathering this time; however, it would do me great good to take the hands of the sportsmen of the State again. Give them all my hearty good wishes, with the compliments of the season. Hoping and believing that you may have a large and enthusiastic meetine, I am, sincerely yours.

Las G. PORTMAN (Sunt. of Nicharies a

m, sincerely yours.

Jas. G. Portman. (Supt. of Fisheries.)

[Mr. Portman's paper will appear later.]

Dr. E. S. Holmes, President Michigan Sportsman's Association:

DEAR SHI-I regret much that I shall not be able to attend your annual meeting, but I am compelled to be present to-morrow night the I'th) at the meeting of "The Sportsman's and Game Dealers" having been one of those appointed at the previous meeting by draft the constitution and by-laws. It is no, desire the cuts the constitution and by-laws. It is not shown to the Michigan Sportsman's Association of the Michigan Sportsman's Association to this new organization. I have been for four years trying to this new organization. I have been for four years trying to the previous meeting the same of the michigan sportsman's trying to the same of the michigan sportsman's have been for four years trying to the same of the michigan sportsman's trying to the same of the same

ing; and also the expression of the opinions of others, and the result.

At the meeting to-morrow night active service will be taken towards a National Meeting.

I have received many letters from the East as well as from the West, favoring the movement. I hope the Michigan Sportsman 5 Association will look upon it as favorably.

As I look back to six years ago I cannot but realize how all look back to six years ago I cannot but realize how all last been done in the interval towards the better protection of game. For what has been done the Michigan Sportsman Association is entitled to much credit. There is much year to be done, and if every other State Association was like the Michigan Sportsman's Association, it would not be long before we should have reached that position in the protection of game and fish of America, which every game and fish protector yearns for. But, unfortunately, the Michigan Sportsman's Association is as conspicuous among State Sportsman's Association is as conspicuous are for the absence of all interest and all efforts in that direction.

I hope your association will ever continue in the noble work it has undertaken.

And, in conclusion, let me personally, as a sportsman and game protector, thank the Michigan Sportsman's Association.

The secretary then read the following article referred to:

it has undertaken.

It has undertaken and the mersonally, as a sportsman and ame protector, thank the Michigan Sportsman's Association for what they have done. Yours very truly,

N. Rowe.

The sceretary then read the following article referred to:

"The chairman stated the object of the meeting and drew attention to the incongruities and absurdities existing in the game laws of the different States, and the necessity for harmonizing them. So long as the Eastern and some of the Western markets were kept open for the sale of game-one or two months after the Chicago market closed, the game law of Chicago and other cities of Illinois, and would totally defeat the measures of other Western States, the game laws of which were similar in provisions to that of Illinois in preserving the game. Even if all the game of the country centered in the State of Hilmois, what would it avail for the season to close in Illinois, January 5, while the St. Louis and Eastern markets kept open for one or two months longer? But when the game of Illinois at the present time, owing to the outrageous slaughter, amounted to but an infinitessimal portion of the game of the United States, and the Chicago market was to a great extent an entrepot for Eastern markets, it seemed the policy of wisdom to take such steps as would bring the date to that of other markets, if by extending the open season for the sale of game to February 1, other States could be induced to close their season at the same time. A month would then have been gained in the important markets of the country, and as the general sentiment of the game elastes was to rigidly enforced the law if extended to that date, their co-operation would be an important factor in the protection of game, for if they would not sell it, those who lived by the capture of game, to find a servery one must acknowledge, would be an important factor in the protection of game, for if they would not have any inducement to llegally capture it. As an instance that the closing of the Chicago market for it t

result."

Dr. J. C. Parker, one of the State Fish Commissioners, then read a paper on "The Brook Trout in the Lower Peninsula." This is printed in our "Sea and River Fishing" columns. The subject then turned upon game birds.

Mr. Greenwood, of Saginaw City, considered the ruffed grouse the finest game bird we have; spoke of their increase in numbers and their feeding largely upon the buds of the popple bushes that spring up after the timber is cut off, and advocated a liberal bounty upon the heads of foxes, owls and hawks.

no municipal many popular that spring up after the timber is cut oil, and advocated a liberal bounty upon the heads of foxes, owls and lawks.

Mr. Cate, of Bay City, spoke of Mr. Holly of that city who last season had destroyed twenty foxes with knounds, and last week had killed three more, all out of a large thicket near the city, and the grouse were becoming much more plentful on that ground. He thought the foxes destroyed more grouse than all the sportsmen together.

Fresident Holmes said that last spring the Kent County Sportsmen's Cubo offered a bounty of twenty-five cents each on hawks and owls, and had received 98 up to the present time, and that there were more grouse in that vicinity than ever before for many years. He considered it very important that some inducement should be held out to the boys in destroying predactions birds and animals, the skins of which were valueless; spoke of the great destruction of game, song and insectivorous birds done by hawks, owls, etc., and advised the members when out shooting to shoot their enomies.

Mr. Greenwood mentioned that every district represented in the convention had the grouse, and favored prompt action in offering bounties.

Mr. Keeney, of Eric, said that water fowl, colin and grouse were more plentiful with them than for many years; that his club do not permit a gun fired on their marshes before the 1st of September. Teal and mallards bring shooting, and said his club do not permit a gun fired on their marshes before the 1st of September. Teal and mallards breed in abundance in their marshes, for the reason that they have not been dis-

turbed during the breeding season for the past two years. He also advocated a special Sunday law to arrest the depredations of marauders who come over the State line and violate the law on Sunday, when a process could not be served, and are back again by Monday norning.

Prof. Roney, of East Seginaw, moved the appointment of a committee of three to recommend a bounty tariff upon the heads of foxes, wild cats, skunks, owls and hawks, anxiliary clubs to be governed by the bounties adopted by this association. Carried, and Messus. Greenwood, Roney and Holly was appointed as such committee. On motion the President added Messus, Madge, Greenwood and Keeney to the enforcement committee.

Mr. A. H. Mershon spoke in severe terms of lumbermen who hire men to shoot deer at illegal seasons, with which to supply their lumber camps.

After some further discussion the meeting adjourned until 7 P. M.

TUESDAY EVENING SESSION.

TUESDAY EVENING SESSION,

Meeting called to order by the President and minutes of previous meeting read and approved.

The committee on a State bounty tariff on the heads of predatory birds and animals made a report, recommending bounties as follows: Foxes, \$1; wildcats, \$1; skunks, 50e; hawks, 25e; owls, 25e. Auxiliary clubs in offering bounties to be bound by those adopted by the State Association.

The report of the committee was adopted as read.

By request of the association the President then read his retiring address as follows:

PRESIDENT HOLMES' ADDRESS.

PRESIDENT HOLMES' ADDRESS.

The wheels of time, rolling on the cycle of life, have brought us to another—the seventh—anniversary of the Michigan Sportsmen's Association. These pleasant reunions afford a fitting opportunity for reviewing the past, as well as for mapping out new work to be done. I therefore ask your tention to a hastily written retrospect, and a few suggestions. From its inception, the objects of this organization have been the increase of cheap and heathful food for the people, and of inducements to manly and innocent recreations, the better acquaintance with the natural history and correct names of game animals of the earth, air and water, and the popularizing of field sports. These are worthy objects. All classes of community that desire the well-being of man, can, and should unite with us in our beneficent work. We endeavor to prevent wone-doing and crime by filling up our leisure with innocent health-giving and honorable sports. Keep the mind pre-occupied with good thoughts and evil will now the center.

popularizing of field sports. These are worthy objects. All classes of community that desire the well-being of man, can, and should unite with us in our beneficent work. We endeavor to prevent worn-doing and erine by filling up our deleavor to prevent worn-doing and erine by filling up our deleavor to preserve bedilty health and vigor by taking occasional doses of open-air exercise and invigorating sporting excursions, and sun baths. A sound mind in a sound body is the perfection of manhood. We endeavor to continue and increase the supply of the cheap and healthul food derived-tion during their breeding and rearing seasons. We wish to adopt the same rules in regard to our wild game of fur, fin and feather that the intelligent and thirty stock-grower and herder would apply to his flocks and herds; so that they may constantly increase, and allow liberal drafts to be made from them at proper seasons, when their flesh is in its best condition for food. We endeavor by obedience to the taws, and strict one discussion of the condition
The thing of first importance is a code of simple and equitable laws that will command the respect of all order-loving and law-abiding citizens that have given this subject sufficient attention to enable them to think intelligently on the subject. It is very difficult to secure respect for or the enforcement of laws that do not commend themselves to the good sense of the better classes of the people. Again, sportsmen and game protectionists who, like other people, cannot all think alike, must compromise with each other, and agree on a code of laws that all will endorse and uncompromisingly support. Having secured these two points, and perhaps we have already done so in the main, the next best thing that I can suggest, is to secure the services of a good, enthusiastic, carnest man, who will devote his whole time and attention to the work, and will act as missionary and detective all over the State. We ought to have an independent State officer, appointed by the Governor, on the nomination of the State Sportsmen's Association, and paid by the State, to do this work. But as we have no such provision of law, I am in favor of raising a fund by subscription and hiring a missionary for six months or a year, as an experiment, to give light to the Gentlies. I would have him give especial attention to those parts of the State where there are none, and wake up the old ones—not so much for the enforcement of the game laws, as to the importance of obedience to them, because they are good. Secure the co-operation of all classes, especially the farmers and land owners, marketmen and common carriers. I am satisfied that one good man devoting his whole time to this work could do more good in six months than could be done in any other way. I therefore respectfully ask your careful consideration of this subject. In taking leave of the official position which your partiality has so long kept me in, as I desire to at the close of this session, I wish to assure you of my continued interest in the objects for the pronotion of which t

REPORT OF COMMITTEE ON FISH LAWS.

dial support you have so generously given to me. [Applause.]

REPORT OF COMMITTEE ON FISH LAWS.

Dr. Parker, of the Committee on Fish Laws, including propagation as well as protection, reported verbully that the Fish Commission were able to procure only about 15,000,000 eggs, owing to a severe storm which set in early, instead of 20,000,000 to 30,000,000 as they expected. They have now at the hatchery in Detroit about 20,000,000 eggs which promise to do nicely; also at the new hatchery, established at Paris the past summer, about 500,000 brook trout eggs which Supt. Portman says are looking finely. The commission have also received about 3,000 carp from Washington, which are to be distributed in the spring. Some advance was also made by Supt. Portman last year in collecting and hatching black bass, and it was expected that next spring he would be able to furnish a quantity of these fine fish for our inland lakes. They had decided to discontinue the planting of whitefish in inland lakes, except in waters where they naturally exist, as Higgins' Lake, for instance, for the reason that they never come to the surface. Many streams had been stocked with eels, but no more would be planted until it was decided that they propagate themselves. The hatchery at Pokagon laked sufficient water and was consequently moved to Paris on the Grand Rapids and Indiana K. R., where a most excellent place was found, and next year they expected to turn out 1,000,000 brook trout.

REPORT OF THE U. S. FISH COMMISSION.

1,000,000 brook trout.

REPORT OF THE U. S. FISH COMMISSION.

Mr. Clurk reported for the Michigan branch of the United States Fish Commission that they had in their hatching house at Northwille a year ago 14,500,000 eggs, and this year had about 22,500,000 eggs. About 1,500,000 of these were shipped away to other countries for other kinds of eggs we have not here. They have also at Northwille about 200,000 brook trout eggs. The commission are giving especial attention to the breeding of California trout by building larger ponds and more of them, and intend in time to have fish enough there to get at least 5,000,000 of eggs per year.

In addition to the California trout there, the speaker got 50,000 more from California, all to be kept at Northville undisturbed for breeding purposes. At two years old they expect to have 25,000 fish, and they intend to make that the headquarters for the California trout work of the commission. He expected that in five or ten years Michigan would have California trout in her streams, more plentful than eels are now.

Referring to the question of prosecuting settlers who kill

heed contact for the California trout work of the commission. He expected that in five or ten years Michigan would have California trout in her streams, more plentiful than eels are now.

Referring to the question of prosecuting settlers who kill game out of season for their own use, the President said he had never heard but one opinion expressed, viz: that there was not a member of this association who would prosecute them or countenance such a proceeding when it was done to furnish food for their families; but he would prosecute them or countenance such a proceeding when it was done to furnish food for their families; but he would prosecute to the bitter end men who caugit live deer on the snow crust and tied them up in barns to die, or killed game in any other illegal way or time, except for the necessities of themselves or families.

Prof. Roney said the association had repeatedly put itself upon record as bolding similar views as those just expressed by the President, and thought there was not a member who held a contrary opinion.

Mr. Ball, of Midland, objected to the clause "capturing in water" in the present law protecting deer, inasmuch as a mortally wounded deer will often go into a lake and lie down in the bullrushes or on an island, and according to the letter of the law he must be left there. He thought wounded deer should be captured in any reasonable way rather than escape to suffer and die.

President Holmes thought Mr. Ball construct the law to literally. He understood it to mean the deer should not be killed in the water, and it was intended to prevent the killing of deer in deep water from boat, by shooting or clubbing them. He also thought the phraseology of the clause could be stricken out for the reason that, technique will be stricken out for the reason that technique violations of the law, by a mossback jury who would insist upon the strict letter of the law in such a case, though being flag and the violations.

Mr. R. J. Birney, of Saginaw, reported that one man at Manistee Lake, had, d

The following is an extract from the publishing committee's

The following is an extract from the publishing committee's report:

"Your committee have also compiled a large list of names of sportsmen, game protectionists and fishculturists in Michigan, all properly registered in an indexed book, by towns. This will be a valuable help in the distribution of the association's publications, and we desire the personal assistance of every member of this association in augmenting this list to the largest possible number. Names of members and officers of clubs as well as individual sportsmen not members of clubs, are earnestly solicited, and should be sent to the present secretary, W. B. Mershon, East Saginaw. Your committee are gratified to report that they were able this year to furnish a copy of our annual book to the editor of each newspaper in the State of Michigan, as shown by the above report. The object of this was to show the association in its true light, as an organization working for the good of all classes of citizens, and to disabuse the public mind of any prejudices which might exist concerning its purposes. To this end we sought the exist concerning its purposes. To this end we sought the valued influence of the press of the State, particularly the papers in the northern game sections, which are so effective in nolding public opinion in their respective localities, and the highly complimentary and discriminative notices already received in return for the copy of our proceedings sent, show that the leaven is working and that an earnest game protection sentiment throughout the entire State is only a matter of time."

Respectfully submitted,

Ww. B. Mershon,

Publishing Committee.

On motion adjourned until 9 o'clock to-morrow morning.

THREE DAYS ON BRUIN'S TRAIL.

THREE DAYS ON BRUIN'S TRAIL.

I AVING a few days of spare time last fall, I thought I could occupy them in no better way than in a hunt. So taking my rifle and a large 30-lbs, bear trap, two good dogs and two Indians, as good as the McCloud River tribe affords, I started bright and early one Monday morning and set out for a point where I had often been before. This was up the McCloud River, about fifteen miles from the United States trout ponds. We arrived there all safely in time to kill a good, fat, four-pointed buck for emp meat, to pitch our tent and to set our bear trap. I set the trap at the foot of a large sugar-pine tree, using for the fastening a large, heavy pole, over which I slipped the large ring of the chain, and then splitting the pole, wedged it, as I supposed, perfectly secure. Then piling up limbs and logs on either side of the trap, we builted it with parts of the fresh deer.

Then next morning, starting very early and going to our trap, we found to our surprise that our trap was gone. Looking around very carefully for a short time, we found that a very large bear (at least we supposed it to be very large by the track) had been there through the night, had got into the trap, and being so large and powerful had worked the wedge out of the end of the pole, and had made away with trap and all. Consulting with the two Indians, I found that they were very much excited over it, and also very anxious to follow up old Bruin and get the trap back, together with his skin. So taking our two dogs we started on the track, and as the Indians are very good at tracking we had no trouble in following, but could travel as fast as the roughness of the mountains would allow; we went on and on, thinking we might perhaps come up with him at any time; but after the first six or eight miles we found that the bear was leading through a very rough country, down through deep canyons, through the thick brush and over rocky points, where one would think it almost imposible for a free bear to go, much less one carrying th

break.

Roasting a little more venison, we made out a breakfast, fed our dogs, and again started on the track. After traveling a few miles it led us into a thick brushy canyon, where it was nearly impossible to crawl through, and in there we expected to come up with him, as we thought he would surely get the trap fast in the brush, so we traveled very slowly, keeping a sharp bokout for him. After traveling some two miles we crossed the bushy canyon and came out again into more open traveling. The track second to look a little more fresh: and, to all appearances, the old fellow was considerably refreshed too, for he started out of there at a good smart pace, but was traveling more in a circle, so that his trail did not lead us so much away from camp. It was then getting two o'clock in the afternoon, but the signs being fresher, the Indians' spirits seemed to revive, and on we went until

night again overtook us. But we were not quite so fortunate

night again overtook us. But we were not quite so fortunate that night, for, aithough we had seen a good many deer through the day, as the night was approaching we could not flud any more, and we had to camp that night without even venison to eat, which was not very pleasant after our long day's travel with nothing to eat since the carly morning. The poor dogs whined around us in a half famished state. Another dreary night was finally passed. Early the next morning the Indians took the guns and slipped out a short distance and succeeded in killing a fine deer. We made a hearty breakfast and felt considerably revived in strength and spirits.

Then we set out upon our third day's travel, and soon came to a spot where the bear had been lying down. But he had evidently started on of his own free will. The track, however, appeared quite fresh. Not long after this we saw a large black bear, which we shot at several times, but only succeeded in crippling him, as he was a good distance away, and we did not care to leave our track nor to let the dogs loose, so on we went. The old fellow was apparently getting very irred, but it was quite difficult to tell which was tiring the fastest, the bear or ourselves. I, for one, was nearly fired out, and Bruin was then leading us up a steep mountain. We kept on that day until noon, the track looking still fresh and the dogs seemed getting very uneasy, and urged very hard to go ahead. We kept them back a short distance longer, but finally they grew so hard to mannege that I told the Indians to let them loose; and the moment they were free they dashed off at a fearful pace, and in less than an hour after they started we heard them making a terrible fuss. But instead of going straight ahead, they were away off to our left and considerably below us, and we hardly knew whether to go straight to the dogs or to follow the dog and they were still barking. Upon getting in sight of the dogs, we saw that sure enough they had brought the old fellow to bay. He was whirling around and fighting

There are some hunters who go out and would like to see the game come to camp to be killed, but that is not the case with me. The more labor and excitement, the more sport J. B. C.

for me. McCLoup River, Shasta County, Cal.

THE DESTRUCTION OF LARGE GAME.

A TAX FOR FOREIGN SPORTSMEN.

YOUR columns have done manful work during the past

A TAX FOR FOREIGN SPORTSMEN.

YOUR columns have done manful work during the past few years, in exposing the havoe caused by skin-hunters among the large game of the West. But the absence of efficient game wardens makes a remedy difficult. Now I want to call your attention to another cause of the diminution of game; to suggest a remedy which might be drawn from this cause, and to enlist your sympathy and your services in the whole subject.

Everyone who has shot much in the Western Territories has doubtless been struck by the number of English sportsmen, whom he meets or hears of. They go everywhere; they seek game of every kind; their wealth puts the resources of the country at their feet; they raise the wages of lunters; the best ponies fall to their lot. With unlimited time and an unlimited purse they carry everything before them. Look over the columns of the London Field, for instance. It contains more information in regard to our Western game, where to find it, where to outfit, how to hunt, I verily believe, than your own pages. That many of these sportsmen are most charming fellows is not to the point. A few go to see the country, to taste of the frontier life, and are satisfied with a specimen or two of each kind of game. But the majority reckon the success of their expedition by the number of heads they bring to bug. If game is plenty they do not hesitate to kill it. If it is searce, their grumbling shows what they would do if chance offered. I have in mind an English gentleman who hunted in the Big Horns three or four years ago, who was said by his own guide to have killed ten thousand tons of game. This was of course an exaggeration, but he saw nothing that he did not pursue; he used up two horses completely in a two months' trip. His party killed, for instance, thirty-five bears, and other game in proportion.

Now all this is in violation of the Wyoming game laws, which forbid the killing of animals, even in senson, for any other purpose than that of food. They provide that no meat shall be wasted. Th

enforce the laws against skin-hunter and Englishman alike. Then in addition prohibit by law the exportation of wild hides, and there will be some chance of the preservation of elk, sheep and black-tail, at least in the rough and mountainous country where cattle cannot live. I do not think this tax would lessen the number of visiting English sportsmen, but it would diminish their slaughter of game, by providing at Bridger and Ruwlins, Rock Creek and Cheyenne, men who would question guides, examine packages of heads, find out in some way whether an undue quantity of game had been killed, and, if so, exact the penalty. Where three years ago a dozen clk were seen in the Big Horns, to-day there is barely one, and the Englishmen are to blame along with the skin-hunters.

LOADING FOR GAME.

London, Ontario, 1882

London, Ontario, 1882.

In a late number of Forest and Stream:
In a late number of Forest and Stream I perceive that you invite discussion upon the subject of loading the breechloader for the different kinds of game.
During the last seven years I have fired many shots at the target with 10 and 12-gauge guns, and I persuaded two friends to experiment with 16 and 20-gauge guns.
The powders used were Curtis & Harvey's, Pigon, Wilks & Laurence's, Házard's electric, Orange lightning, and Hamilton's caribou. The shot, Tatham's soft and chilled. The cartridge-cases and wads, Ely's. From these experiments I have drawn my conclusions as below:

THE CHARGES OF POWDERS.

THE CHARGES OF POWDERS. 2½ to 2½ dis. Curtis & Harvey's No. 4. 2½ to 2½ drs. Pigon, Wilks & Laurence's No. 4. 2½ to 2½ drs. Pigon, Wilks & Laurence's No. 4.

or a 16-frauge: 2½ to 2½ drs. Curtis & Harvey's No. 4. 2½ to 2½ drs. Pigon. Wilkes & Laurence's No. 4. 2½ to 3 drs. Orange Lightning No. 4.

27g to 40.5 Orange inglaning No. 4.
3 to 34d ars. Curtis & Harvey's No. 4.
3 to 34d ars. Pigon, Wilkes & Laurence's No. 4.
3 to 34d ars. Pigon, Wilkes & Laurence's No. 4.
3 to 34d ars. Hazard's Electric No. 5.
34d to 34d drs. Orange Lightning No. 5.
34d to 34d drs. Hamilton Carilhou No. 5.

or a 10-tauge;
314 to 44 dts. Curtis & Harvey's No. 6.
324 to 42 drs. Pigon, Wilks & Laurence's No. 6.
324 to 42 drs. Hazard's Electric No. 6.
4 to 42 drs. Orange Lighting No. 6.
4 to 42 drs. Hamilton Caribou No. 6.

THE CHARGES OF SHOT.

For a 29-gauge gun, 34 oz. of fine shot; 1 oz. of coarse.
For a 16-gauge gun, 1 oz. of fine shot; 1½ ozs. of coarse.
For a 16-gauge gun, 1½ ozs. of Sos. of Nos. 10, 9, 8, 7 and 6; 1½ ozs. of 5, 4
nd 3; or, 1½ ozs. of 2 and 1.
For a 10-gauge gun, 1½ ozs. of Nos. 10, 9, 8, 7 and 6; 1½ ozs. of 5, 4
nd 3; or, 1½ ozs. of 2 and 1.

Would it not be well for correspondents to give charges by weight regarding loads for game? I have experimented with several powder and shot measures, and will give the result of two of them. One gauge is stamped "Bridgeport G. I. Co., No. 21." One measured ounce from first gives 486grs. by weight; 1; 0zs. gives 692grs., 37grs. less than would be expected from 480grs. to oz. The second gauge (No. 21) gives 435grs. to oz. by weight; 1; 10z. gives 588grs. 64grs. less than 435grs. to oz. should yield, and 132grs. less than 1;0z. should weigh (taking 480grs. to oz). Powder measures vary proportion ately. You see how inaccurately they are graduated. In your last issue "Border Rufflau" gives "4;drs. Orange duck powder, No. 4 grain, 1;ozs. No. 5 shot, two pink edge wads

on powder and black edge on shot." This for 12-gauge gun. I used the same articles exactly as mentioned by him; weighed 123½grs. powder (4½drs.), 540grs. No. 5 shot (1½ oz), and utterly failed to get the same in a paper 12-gauge, 2½ shell, with two pink wads, and only medium wads employed. If sportsmen in reporting would carefully weigh the contents of shells which they find best suited for certain guns, game, etc., and give the weight, then others can reproduce the same; but if they give charges by measured drams and ounces, without stating the number, etc., of measures used, we can only approximate, and that poorly.—D. W. H.

MUZZLE vs. BREECH.

Billor Forest and Stream:

I notice of late in your valuable paper a number of articles discussing the relative merits of breech and muzzle-loading rifles, but they seem to be so one-sided that I cannot refrain from giving my own views on the subject.

Both nuzzle-loaders and breech-loaders have their good from giving my own views on the subject.

Both nuzzle-loaders and breech-loaders have their good facting my own views on the subject.

Both nuzzle-loaders and breech-loaders from giving and facility for cleaning, that I think no one who if they are accustomed to them would willingly return to the former, accustomed to them would willingly return to the former, accustomed to them would willingly return to the former.

The chief advantages claimed for muzzle-loaders are inexpensiveness of ammunition, and accuracy and lowness of trajectory at short range.

Now, in all trials of rifles a fixed rest should be used, so that the guu may have full credit for its work, and its no current should be determined by the grouping of the shorts and not by their position in regard to the point sinced at, for the comparative accuracy of different gnuss. In termining the comparative accuracy of different gnuss. In termining the comparative accuracy of different gnuss. In termining from 181s to 1618s, and using a round ball, and in the case of breech-loaders to the same style of gun, 32 to .38 cal., using from Silbs, to 1618s, and using a round ball, and in the case of breech-loaders to the same style of gun, 32 to .38 cal., using from 181s to 4618s, with conical ball and telescopie sights are not to be regarded as practical rifles, but the other than the prechange of gunder the sum of the comparative for the comparative for any accuracy prices of mechanism; and cannot justly be compared with a muzzle-loader, while on the other hands of the part of the comparative for any accuracy review of the comparative for a formal comparative

non est disputantum.

I have spoken of small bore rifles because they are in very general use for such game as squirrels, rabbits, ducks, geese,

etc., and on occasion are quite effective against deer. More-over they are very convenient, the ammunition is light and takes up little room, and in skilful hands they are quite equal

takes up into room, and in skilly made study are quite equator large bores within ordinary distances.

In regard to material for cartridge-cases, I believe that paper could be used to advantage as it is in cases for shotguns; but bruss shells would be found useful at times. C. NEW ROCHELLE, N. Y.

guns; but brass shells would be found useful at times. C. New Rochelle, N. Y.

Editor Forcet and Stream:

The article of Mr. Van Dyke was especially interesting to me, as I have tried in vain to shoot round bullets from breechloaders with any accuracy. Since his letter appeared I have made another trial, but with no better success. The first attempt was made with a Adoeal, anxiliary rifle barrel, but they flew wildly. I then took a Adoeal, Ballard, and loaded the shells ful, putting a wad at the end. I had some round bullets that, with a greesed patch, fitted the barrel snugly. These I pushed down upon the shell, having first put in two wads between the latter and the bullet, so that the ball should be left in position just above the end of the chamber. My efforts were a perfect failure, as the bullets at fifteen rods would scatter over a foot of space. I then tried the Ballard with the regular patched bullet of 285 grains, loaded from the breech in the usual manner, and at the same distance placed a succession of bullets so close that a silver dollar wend cover the holes. I fired in both cases while sitting on a low seat, and resting elbow on the knee. I noted that Mr. Van Dyke says that for patched round balls loaded from the muzzle 'the barrel should be cut straight." by which he must mean, I suppose, that the twist should be what is called a "slow twist." He also says that the barrel should not be choked much. The Ballard is not choked, but has not a slow twist. I cannot conceive why a close-effiting round patched ball that had been put down from the muzzle, should strip in going out, even with a large charge of powder. round patched ball that had been put down from the muzzle, should strip in going out, even with a large charge of powder. The shelfs contained 60 grains of strong powder. Several years since I experimented with round bullets thoroughly, but always failed to do good work with them, when loaded from either breech or muzzle. A correspondent from Bridgeport showed me (in Fonesr Ann Stream, with cuts) how to patch the bullets for breech-loading shells, but after faithful trials I had to give it up. I have turned out wooden pluss, and patched them, with bulls in front, (making a nice job) but it was no go, the balls would fly wildly. For common hunting purposes for small game, many lovers of the rifle would like to use the light round bullet, as there is a mere crack only when the gun is discharged, and not a bit of recoil. If the secret of success is in the slow twist of the old-fashioned rifle, then not many breech-loaders will answer. If any one will explain the cause of my failure I will try fashioned rifle, then not many breech-loaders will answer. If any one will explain the cause of my failure I will try

If any one will explain the cause of my failure I will try ngain.

Mr. Van Dyke has been a valuable correspondent of Forest AND STREAM, and there are doubtless a host of readers who have been interested and benefited by his experience, and the writer is one of the number.

His ,65 or ,75-cal, double Le Fever rifle may have a slow twist, which may account for his success with round bullets at the target and among the wild-cats, and the writer wishes he had a duplicate, and was en route for southern California to shoot in his company for a few months.

I might add that I am no novice in this art, am an apt mechanic, and have owned many good rifles, and as most men have a hobby of some sort. I have this one, and if there is a way to let fly the round bullets from a breech-loading rifle unerringly for moderate distances I shall try to do it for pastime.

D. H. S.

pastime. Rivington, Conn.

Will "Colin" please state how be loads his rifle shells with round balls; whether he fills the shell to the end with wads and cork, or forces the ball down immediately upon the top of the small powder charge he mentions, and oblige—Subscriber. (Chicago. Ill.)

A RECORD OF DEER SHOOTING.

A RECORD OF DEER SHOOTING.

Editor Forest and Stream.:

In your issue of the 12th ult., I notice an article from "Byne" of Arkansas, in which he shows the killing power of his shot gun, weighing 18 lbs., and loaded with 8 drs. powder, and 8 ozs. No. 3 buckshot. He did good shooting at sixty and seventy yards, once making a double on deer at the former distance.

Will you let me give my idea of the right gun for deer shooting in the woods? I will give facts only, not theory. I shoot a three-barrel Baker gun; shot barrels ten-gauge; rifte. 44 cal.; weight ten pounds. I load with 4 drs. Orange ducking powder, and 1½ ozs. No. 2 buck shot. I did not weigh the shot, but was told their weight. At all events, there were only nine No. 2 buckshot in my shells. Notice the difference; "Byrne's" gun is three pounds heavier than mine. He has only a double shot gun, while I have a double shot gun and a rifle. He shoots twice as much powder, and I think I am safe in saying twice as much shot also.

Now for the shooting. On one hunt, made in November last, I killed seven deer, which was the last score made out of four, our party getting only fifteen deer. We hunted in the Choctaw Nation, and found deer very scarce. I give the shots in their order. 1. A two-year-old buck, standing broad side, measured distance, 75 yards, killed dead in his tracks with right barrel of shot gun, four shot striking him. 2. A large doc, standing quartering 140 yards (guessed distance), shot with rille, grazing heart, and breaking up liver. She running by me passed at 80 yards, measured distance. I fred one barrel of the shot gun, knocking her dead in tracks, putting four shot in her, one breaking her neck. She could not have lived ten minutes, after the rille ball struck her, but my rule is to shoot as long as a deer shows life. 3. A very large buck, killed ire-hunting. Distance guessed at sixty yards, as the eyes were just parted, and the sight very strong. Shot with shot gun, five shot taking effect, the deer running about fifty yards. 4. A yearli

This gun is not "choked especially for buck shot," but it shoots them all the same, and with the advantage of the rifle barrel, which shoots as true and far as any breech-loading rifle of same calibre, it makes the best gun in the world, for every sort of hunting, especially for large game in timbered country. I have kilded turkeys at 75 yards repeatedly, using No. 1 shot; ducks and chickens same distance, using No. 6, childed. Once I kilded a chicken 87 yards, using No. 6 shot, striking it with at least three shot, for it had a wing and leg broken, and was shot in the head. No further examination was made. At 35 yards, I have put 894 10's, 429 8's, and 300 6's in a twenty-four inch circle.

I am not a professional sportsman, and am not writing in the interests of any company, am not well enough "up" in sporting matters to know whether or not my gun is extra-ordinary, but I know it beats anything I have ever yet tried.

I am pastor of the Baptist Church in this city, and as fond of hunting as anybody. This gun is not "choked especially for buck shot," but it

RUST-SPOTS IN GUN BARRELS.

RUST-SPOTS IN GUN BARRELS.

COME weeks since I started the question of "spots in guns," and since then I have found out an error in my statement which I wish to correct. On looking over my notes I find that while using Hazard's 4 ducking powder I had no spots in my guns, but on the recommendation of a gunner I was induced to try American FF, and it was after that that the trouble took place. Two of my friends also took to "cheapness," and soon the same result followed. In one case three days was sufficient to do it and in the other about a week. In these cases the spots appeared while we three were shooting on the marsh and the guns were constantly exposed to dampness. Further, I find that three more of my friends who have shot with me at the same place and who used the expensive powder, have no spots in their guns. The six men I have mentioned all pursued the same system of cleaning, viz.: first, paper, then kerosene, then rag until they were clean, and finally sperm oil. This at night, half an lour's work at least, morning performance also, at noon same. Cleaning enough, I should think. Now as to the spots. Let any one look down their barrels and they will notice that these spots run in curious purallel lines from the chamber to any one look down their barrels and fleey will notice that these spots run in curious parallel lines from the chamber to nearly two-thirds of the length of the gun: There they ston. At the muzzle ordinary rust collects, but this is always easily removed. Cheap, moist powder is to be avoided at the sea shore, in my opinion. Will some one who shoots entirely away from the salt air kindly give their experience, neution-ing the grade of powder they use ?—F. S. (Boston, Mass.)

I have thought I would withhold my mite until I read "Californian's" theory. He says never to clean a gun after shooting, but put away just as it is, with the burnt powder dust on its barrels. This is, in my dearly bought experience, an error; and I foolishly took the advice of a friend, and found when alas! too late, that I had ruined the polish in my 12-gauge Remington. Before I 'blundered' I used to clean as follows, and I had one of the finest polished guns in the whole country: Wet a flannel and run it through the barrels to remove the powder dust, then follow with a dry cotton cloth and rub it back and forth, until the barrels are perfectly dry. Then take a woolen cloth and thoroughly saturate it with best sperm oil and leave as much as possible on the inside of the barrels. I never was troubled with rust. "Border Rufflam" is right in his logic, and shows practical experience in the question at issue. "Californian" says "the finer the grade of barrels the more likely they are to 'scah." which is correct, and the lower the grade the less likely, etc. A wagon tire will stand all kinds of weather; and will rust but a trifle. Not so with fine steel. I have inspected a numbor of guns which were not cleaned after the day's shooting and found them in every instance to be badly rusted. My pride is in my gun, and if my dearest friend were to tell me my gun would not rust by leaving it uncleaned, I would not for one fleeting moment credit his words. By "cternal vigiliance" only can gun barrels be kept from rusting, If any one doubts, let him buy a fine Damascus barrel and subject, it to I have thought I would withhold my mite until I read not for one fleeting moment credit his words. By "cternal vigilance" only can gun barrels be kept from rusting. If any one doubts, let him buy a fine Damascus barrel and subject it to the test and he will find out that it pays to clean a gun as soon as the shooting is over for the day. In my experience the different grades of powder have nothing whatever to do with rust. I have used the poorest and the best, and have found no difference in this line. In fact, I was using "club sporting," a high grade powder, when my choice gun became speckled with rust. Nothing will remove rust specks but repolishing in a lathe, which will cost from \$2 to \$5, according to amount of rust in the barrels.—Dell, (Sauk Centre, Minn).

Permit me to make this statement of fact bearing upon the subject. Capt. Ralph Whitchead, who has killed more birds, perhaps, in the last twenty years than any other man between St. Louis and Chicago, only cleans the inside of his gun barrels twice a year; that is, when the spring and the fall shootings begin; and I am confident that the inside of his barrels are in as good, if not better, condition than those of my own gans, which I never prutaway without thoroughly cleaning and oiling. I have the Captain's word for the above statement, and I believe that he is as reliable as any other sportsman, and that is good enough authority. But if it needed confirmation I would add that I have shot with him once or twice a year for the past fifteen years, and have never seen him wipe out his gun when he returned from a day's shooting. No matter what kind of weather it is, he puts away his game and cares for the inner man. Then he wipes the barrels and stock of his gun on the outside with an oiled rag, and sits down to enjoy his pipe and laugh at his guests while they rub and sweat for half an hour over cleaning their guns. None of the others can show smoother, brighter barrels on the inside than he can. This fact I have seen demonstrated on many occasions, by running an oiled rag through his gun barrels after the rest of us were done cleaning.—

I have shot a Scott 12 have which is can bright to have

I have shot a Scott 12-bore which is as bright to-day as when purchased, and it has been used in all kinds of weather. In cleaning it I use new white flannel, benzine and best sperm oil. For a cleaning rod I use a soft pine stick. After wiping the barrels out thoroughly with a rag wet with the benzine, I use one oily rag, then wipe dry with a clean rag. Benzine will take out more dirt with less labor than anything I have ever tried. I think as much depends on where a gun is kept after cleaning, as how it is cleaned. My guns and rifles are kept in a closet next to the chimney, where the temperature is about the same all the year round, and I have never been troubled with rust spots. I have used several grades of powder, from Hazard's ducking down, and don't think that this has anything to do with the spots. If some of your subscribers who are troubled with "gun measles" will have

their guns re-bored and then keep them in a dry, warm closet, I think they will find the barrels kept perfectly bright.—Benzine. (Whitinsville, Mass.)

I do not consider myself a professional sportsman, yet do shooting enough through the year to satisfy me that the mode I follow protects my firearm from rust in every respect. I use for all shooting purposes a .44 cal. breech-loading rifle. Whenever I go out shooting for a day, or fire a single shot, on returning, the first thing I do is to give my rifle a thorough cleaning; never wait until the next day, but do the job up at once. I use a common wooden cleaning rod, and prefer this to all patents. Now I take a few pieces of cotton flannel or sheeting and pass them through the barrel, the first one or sheeting and pass them through the barrel, the first one or sheeting and pass those more use water.) Continue this with much of kerosene and never use water.) Continue this with dry ones, until it shows no signs of foulness, then take a piece, saturate with the oil, and pass slowly through. Lastly, a small piece just to take up the surplus oil, as too much is not good. I stop up the muzzle with a cork, and I examine quite often and replenish with a little fresh oil once in six weeks when not in use.—Amateur. (Machias, Mc.) I do not consider myself a professional sportsman, yet do

The article in your issue of January 12, signed "California," was very good. In our experience we find that clear water should never be used to wash out the barrels. We have found nothing better than sal-soda water (good strength). After a thorough washing, wipe out the lead with a brass wire scratch brush. Then swab the barrels thoroughly with swab well saturated with paradiline-oil. Let your barrels lie in this condition, say twenty-four hours, then wipe out with a clean dry swab. Then swab with the paradiline-oil as before, and oil the outside with the same. You can then put away your gun in a dry place without any fear of rust. We can show you barrels that were treated in this manner some fifteen years ago, and they are as bright now as when put away. The paradiline-oil forms a thin coating over the surface, which excludes the air and prevents rust.—Practical. (Hartford, Conn). Conn).

My plan of preventing fine gun barrels from rusting when laid away during the close season is this: I obtain some pure refined paralline, melt it by placing the vessel containing it in hot water, fill the barrels full, and allow it to congeal inside. not water, in the parties run, and allow it to congeal inside.

I will guarantee that the gun may remain idle for any length
of time and come out bright. It is perfectly harmless, and can
be instantly removed by placing the barrels in hot water.
Paradline melts at 180 degrees Fahrenheit, water boiling at 212
degrees, so any one can see the barrels need not be subjected
to anything like a dangerous heat.—F. B. (Boston, Mass.)

after many experiments, adopted the plan of wip-I have, after many experiments, adopted the plan of wiping out the gun thoroughly, with dry tow first, then, after most of the dirt is removed, I use turpentine and tow freely and dry tow again. If the gun is loaded, use three row wire scratch brush; then tow again. If rust spots are in barrel use wire brush dipped in oil and fine emery. Lastly, oil barrels thoroughly with sperm oil and cork up both ends tightly with good corks. The specks in the barrels will not affect the shooting of the gun, but one does not like to explain or apologize every time a friend looks through your gun.—S. II. M. (Indianapolis, Ind.)

THE PURPOSE OF FIELD SPORTS.

[From Dougall's "Shooting: Its Appliances, Practice, and Purpose,"]

LIAVING now, so far as I have been able, instructed the young sportsman in the Appliances and Practice of the Art of Shooting, I enter, not unreluctantly, on the final and very different branch of this work—its Purpose. The appliances and practice are technical and customary. They admit At young sportsman in the Apphanices and Practice of the Art of Shooting, I enter, not unreluctantly, on the final and very different branch of this work—its Purpose. The appliances and practice are technical and customary. They admit of no objections, save upon modifications arising from differences in opinion or experience. The subjects are taken as things of course, and any argumentation must be on minor matters. But when we enter upon the purpose, we are met by a host of talent, which of recent years has set itself to denounce all field sports as immortal and degrading. The question arises, What need is there, in a work of this nature, intended to instruct sportsmen, who, of all men, do not challenge the innocence of their recreation, to go into the moral lenge the innocence of their recreation, to go into the moral lenge the innocence of their recreation, to go into the moral lenge the innocence of their recreation, to go into the moral lenge the innocence of their recreation, to go into the moral lenge the innocence of their recreation, to go into the moral lenge the innocence of their recreation, to go into the moral lenge the innocence of their recreation, to go into the moral lenge the innocence of their recreation, to go into the moral custom to others. But having naturally thought over the subject, and being one who holds that it is the duty of every man to honestly and fearlessly advocate what he believes to be right, I venture to give the following remarks. I view the whole question from this standpoint, that, where things innocent in themselves are mixed up with things buttful and denounced accordingly, there is no end to the mischief that may ensue. To condenn things good on false arguments appears to me to be quite as mischievous as to praise things wicked. Right and wrong are confounded. When men of high repute, leaders of thought, set themselves, through ignorance or caprice, to mjustly condenn, they also weaken their whole influence in praising that which is undeniably good.

Satirists abound

another the direction of the pressure is reversed. Those of my readers who are conversant with what are termed the Classical Essayists of the eighteenth century, must recollect how the shalts of satire were almost invariably leveled against the visiting London and the adoption of town manners—in plain terms, of greater refinement—by country gentlemen and their wives and daughters. These were counseled to stay at home and follow their rural pursuits and occupations. They were even assailed for introducing London manners into their country houses. Yet every one knows that intellectualism and progress of civilization are the products of city life. The current runs the other way at present, but the twentieth century may see another turn of the wheel, and satire employed to promote field sports, and undo the mischief created by the advocacy of undue intellectualism, if an existing school of writers succeed in well-meant but mistaken efforts.

taken efforts.

It would be a comparatively easy matter to write a school-boy essay on the use and advantages of exercise. All thinking men agree that exercise is a condition of health. What is disputed so keenly of late is the lawfulness of that exercise, as involving cruelty to the lower animals, when it takes the form of field sports. The controversy has been carried on, on one side, with all the force and skill of practiced logicians,

taken efforts.

laying down the principles entirely so as to suit their own convenience, and also, as it appears to me, purposely confounding the meaning of words which are really widely differing; and, on the other side, with vargue general answers, as, for instance, that fox-hunting brings beneficially the different classes of society together, and improves the breed of horses. In a similar spirit, but with the gayer hadinage of his countrymen, when a philosopher gravely asked a French sportsman if he believed it to be lawful for man to kill a partridge, the latter replied, "Of course in the shooting season, and with my gome certificate in my pocket." "But, seriously," says the philosopher, "granting these conditions, is man justified in killing a bird made by the Creator?" "To be sure," replies the sportsman, "if man also eat it," "You believe, then, that man may fearlessly cut a partridge?" "I do, most undoubtedly, if it be properly cooked, with the sauce in perfection!"

It would be quite safe to leave the whole question to the good sense and experience of men in general, and not of transcendentalists only, who are not content with the plain laws of nature, were it not that the arguments of the latter may work much harm. It is from this reason that I regret that the answers made by sportsmen—some of these having distinguished themselves in literature, and therefore being well able to discuss gravely—should be merely defensive and half apologetic. For any more serious reply to fall into such hands as mine—to the pen of one who may be thought to view the whole question from a professional and selfish standpoint—may be deplored. But my profession has only caused me, from the gravest of reasons, to investigate the matter the more deeply and carnestly, and I yield to no sentimentalist in the abhorrence of cruelty. I can add, that I have nixed with sportsmen from boyhood, and that I have especially noted their peculiar tenderness for, and care of, all donestic animals, and their avoidance of all cruelty in the field. There can

stages of man's history the commercial quality was not latent, and in the most recent stages if the hunting has been, or ean be extinguished. My assertion is, that man's nature is alike through all ages—may be modified, but can have no one quality obliterated.

Exactly, then, as the commercial quality always existed more or less, first manifesting itself in the rudest forms of barter, so the hunting quality, now that the chase is no longer the direct means of supporting life in civilized communities, still does exist, and cannot be obliterated. Man is essentially the same being throughout, and cannot possibly divest himself of any one of his attributes. If we do not accept the fact of the progressive stages as given above, the case for my oponents is not improved; for we must then take man as we now find him—a compound of the hunter, the shepherd, the tiller of the ground, and the merchant. The qualities of all these exist in every human breast. It has been humorously but truly said, that were a little rat to run across the Loudon Exchange, the traffic in millions sterling would be suspended for its pursuit, and every reader of history knows that in those diread and supreme moments when vast armics have been traversing the short space which intervened between their meeting in deadly conflict, the chase of a miserable hare has for a time deferred, on more than one occasion, the clash of arms. Such an occurrence happened even so lately as a cone of the first battless of the Franco-German war of 1870. The instinct of the hynter predominated over the discipline of the warrior, and grin soldiers broke those reaks which death

has for a time deferred, on more than one occasion, the clash of arms. Such an occurrence happened even so lately as at one of the first battles of the Franco-German war of 1870. The instinct of the hvnter predominated over the discipline of the warrior, and grim soldiers broke those ranks which death itself could only cause them to close up more solidly as another and another comrade fell. Is there under the sun one mation where a similar passion for the chase does not exist in some form or other, and have we not the authority of Cicero for the assertion, that 'in everything the consent of all nations is to be necounted the law of Nature, and to resist it is to resist the voice of God? 'The wisdom of planting this instinct irrevocably in the human breast seems more and more clearly displayed the deeper we investigate the subject.

The case with which any human institutions, customs, or pursuits may be assailed and plausibly condemned in their entirety from some peculiar standpoint has seldom had a more complete illustration than in controversies on field sports. Not only are the arguments against these strained to the most unfair tension, but the attack upon their morelly are invariably conducted with a departure from the very first principles of discussion, resulting either from prejudice or from great ignorance of the subject. In either case, those who assail the morality of field sports are incompetent to discuss the question fairly. If, on the other hand, they assert that they are masters of the subject, that they have studied it impartially in all its parts, and have really done so, then they may be accused of willful disregard of fair representation of the case, of suppression of truth, and of confounding under one title pursuits and practices so widely differing in character as by no just reason whatever to come under the same category. These pursuits and practices cannot be arraigned under one and the same indictment, if, indeed, one class of them, and that the one really concern, d, can be arraigned u

out taking the trouble to test their genuineness, these premisses have all the weight of proof. These ninety-nine prefer studying by deputy, and estimate assertions less by their intrinsic value than by the faith they have in, or by the general reputation of, the writers so asserting. Words, although only the vericle of ideas or truths, are with the less thoughtful truths themselves, and in this discussion have been made to do double duty, in conveying to the mind of the reader a general and comprehensive conviction of the immorality of field sports founded upon the cruelty involved in some practices which are not field sports at all, differing from the latter not only in essence but in nomenclature, and I can scarcely conceive any graver charge to be brought against public writers than the wilful confounding of separate things under the same verbal designation. The practice of a thing is the very first element in the discussion, else no amount of learning, no liking or disliking, no conscientiousness nor desire to perform a supposed duty, will compensate the evil done to public morality in a much greater degree by confounding words or different things represented by the same words. Truth requires no factitious bolstering, and if a disputant, eager to gain a momentary victory, however conscientiously and with laudable purpose, depart from the real basis of truth, his superstructure of argumentation must fall all the more heavily in the end. Even the best cause will be injured by such a proceeding. Not only have the assailants of the morality of field sports, as it seems to me, argued unfairly, but there is a certain assumption of personal moral superiority on their part which, by the very nature of things, unfairly reinforces their position. They at once get, all the "good" people on their side. On the principle that where there is a doubt in morals, safety lies in entire abnegation, so in this question many readers will be content with the conclusion, that in so doubtful a case as is represented, field sports

may be enjoyed while we are in a state of repose. It is derived from "muser," the French to "loiter," or "trifie." Muser is from the Italian "muser," to stand idle, and in other languages, ancient and modern, with little variation in form, it bears the same meaning, and conveys "inaction." In no language known to me, does it or any other word used as its equivalent, represent field sports. These, as a rule, are termed "the chase," or its equivalent. It is essentially opposed to action, which is the very essence of field sports. It may be possible to take amusement in the field that may involve the capture or death of lower animals, but it by no means follows that such anusement is any branch of field sports. One has a right to demand clear and definite terms in defending an assailed position. The challenged has even more—a right to the choice of weapons. But no concessions are required when I assert that, by the use of the word "amusement," the whole question is misrepresented. Some years ago, during a Saturday afternoon ramble, I chanced upon an individual busily engaged in arranging nets for the capture of larks and other small birds. This was on the Continent; and on entering into conversation with the oiseleur, he was so good as to inform me that he was making arrangements "pour miamuser demain monsieur." Here was the true expression, probably all the more correct that, as I afterwards learned, the man was an able schoolmaster, who knew botter than to use, in speaking of his paltry purpose, any equivalent to the words "Field Sports;" and this is all the more noticeable that the term "in chases" comprehends the pursuit or taking of the smaller animals, not usually followed by British sportsmen. To work his nets the school master, as he showed me, would lie in a dry ditch at the back the pursuit or taking of the smaller animals, not usually followed by British sportsmen. To work his nets the school-master, as he showed me, would lie in a dry ditch at the back of a hedge, holding in his hand the end of a stout cord of some forty yards in length, by pulling which the nets enveloped any unfortunate birds which might be enticed by his

some forty yards in length, by pulling which the nets enveloped any unfortunate birds which might be enticed by his
"decoy-birds" within the fatal precincts. It might be a very
wrong way to spend the Sunday. Tell it not in Pife, publish
it not in the streets of Glasgow! But the poor pedagogue at
least was honest in his phrascology, and his example so far is
worthy of imitation.

The word "sport," on the other hand, has a most corn
prehensive, indeed a most extraordinary range in meaning.
It is cause, it is effect; it is fun, humor, raising pleasurable
candions; and it is these very emotions so raised. There is
lardly any limit to its range, as applied to.anything that lawfully exercises the body and mind or unlawfully excites the
passions and gratifies evil propensities. Hence, without proper qualification, this word "sport" may be, and daily is
sadly abused, as are its derivatives. The simple moralist
who is led by words or terms, not by facts or real knowledge,
knows little or no difference between a "sportsman" and a
"sporting-man," and yet it would be difficult to find in their
pure and actual meaning two words conveying characteristies
more opposed to each other. It is "sport," during hours of
untold toil, to seek the stag in his almost inaccessible mountain haunts; it is "sport" to witness rats worried by a bullterrier; and the rufflanly possessor of a penny gamthing-table
at a village fair incessantly bawk," Now" sy our time, gentlemen sportsmen; make your game while the ball's a-rollin,"
This confusion of things signified has a disastrous effect on
, the proper understanding of this question, but it is taking a

very unfair advantage indeed for practiced dialecticians not to make a most guarded distinction between the true and the false as applied to pursuits and practices so widely different yet condemned under one category.

To distinguish the true from the false it is customary to prefix the word "field" to "sports," and, so far as this mere prefix goes, no fault can be found with those who write in condemnation of the thing signified. They use the term frankly so far as mere phrascology goes (but then go on to argue on other so-called "sports"), and the question comes to be asked, Why do these writers stop short here? If they are competent, by fair and impartial inquiry, to assume a moral superiority and condemn field sports, why will they insist on immorally identifying them, in argument at least, with practices of the most cruel and indefensible character, which they must of necessity know are not carried out in the "field," meaning by that term the scope and scene of the genuine and lawful pursuits? To worry a cat, to bait a bull, to draw a badger, are monstrous cruelties, yet the first seems, from the frequency with which it is brought into play to be the grand piece drattlerie in attacking field sports, by its painful reiteration as being the equivalent of fox-hunting. If these writers insist on using the general term "amusement" wrongly, let them continue to do so to their own satisfaction—and, I may add, stupefaction—but they have no manner of right (and this all the more that they assume so great a moral superiority) to use a vague and general term, to the misleading of the reader, in discussing matters which, to arrive at truth, must be separated so widely as vicious practices dignified with the ame of "sport," and lawful pursuits distinguished by the specific title of "Field Sports."

As the word "chase," which may be said to comprehend all field sports, is the embodiment of "arction." Herein lies the great distinction between the true and the false; a true distinction, sound in its principle and applicat

affecting this controversy, is the embodiment of "finaction," so the word "chase," which may be said to comprehend all field sports, is the embodiment of "action." Herein lies the great distinction between the true and the false; a true distinction, sound in its principle and application. The broad rule may be laid down, and I challenge all honest attempt to deny its correctness, that, in all geautine field sports the persons engaged are participators in the hunt, chase, call it what you will, and voluntarily subject themselves to severe toil. "Hawking and Hunting," says old Butler in his image, so keenly followed, if once practiced, while opportunity, life, and strength remain, demands indescribable exertions; and I know not a more severe and maintained strain upon the muscular and vital energies than grouse shooting during warm weather, or over rough ground in any weather. There may be, and are, motifications of this voluntary labor.

In this saving clause in favor of the morality of its lower phase, that the person enjoying it is himself the actual agent.* We may therefore lay it down as absolute, that true field sports may be invariably distinguished from the Falsely so called by the latter being carried out vicariously. In these the "sportsmen," Heaven save the mark! are mere spectators, generally gratifying, more or less, brutal propensities, and in all probability staking sums of money on certain contingencies.

tain contingencies

WIRE CARTRIDGES.

WIRE CARTRIDGES.

In your issue of Jan. 19, "Border Rufflan" says that wire cartridges "are expensive and are no better than loose shot in a breech-loader, and very little better in a muzzle-loader." If he will invest in a box of wire wads, and load a dozen shell with his customary load of powder, place over this two pink-edge wads, then put in 1½ or 1½oz. of shot, then in accordance with directions inclosed in every box, put on a wire wad and crimp in usual manner, he will obtain better results than by loading without the wire wads. One day while duck-shooting in Minnesota, on the pass that divides Lake Minnetonka from Gray's Lake, a party came up in a boat, and one of the men took his position near me. On criticising him and his armanent I found he carried a 10-gauge 11½lbs, breech-loader. When he fired this gun its concussion seemed sufficient to paralyze and bring down any unfortunate duck flying over. I had a 12-gauge 73/hs. loaded with 3¼drms, powder, and 14oz. shot, No. 5, in left, and No. 7 or 8 in right barrel. All were loaded with these wire wads over shot, and I found myself placed at no disadvantage whatever for regards reaching and killing the game.

Black Ned.

whatever for regards reaching and killing the game.

BLACK NED.

HOUNDING DEER.—Fersburg, N. Y., Jan. 1882.—Editor
Forest and Stream: The New York game law, as it now
stands, I can only consider very defective so far as it relates
to deer, and it is a subterfuge from beginning to end. One
can scarcely select a single issue of Fodds AND Strikan that
is silent in regard to the slaughter of ruffed grouse in an unsportsmanlike manner. These articles will work wonders
in the preservation of this game. After thirty years' experience in deer shooting, is it strange that one should favor a
more stringent law, also for the protection of deer? If it is
considered unsportsmanlike to kill a bird sitting on theground or on a log, or to tree one with a dog and shoot it
then, or to trap them, and if the law makes it a penalty,
should we not have a law passed making it a fine to kill a
deer under similar circumstances, i. e., by being hounded
down or driven to bay in some lake, headed off by the
cancemen and knocked in the head with clubs or riddled by
buck-shot? Only a few counties in the northeastern part of
our State now afford the deer stalker any show whatever.
The latter half of last November found me in camp up in
Herkimer county as usual, not to see how many I could bring
to bag, but to procure two or three for my own winter's use.
I succeeded in securing a buck and two doe, the latter being
very fine specimens. Hardly a day passed by, however,
while I was there, that I could not hear the baying of hounds.
The still hunter can do but little until the leaves fall and
snows come to assist him in following the track. Nor does
he wish to secure much game until the weather is cool
enough to freeze it, so as to insure its keeping for use. On
the contrary those that follow hounding commone when the
season opens, keeping up a constant fusilade lill the 1st of
November. Not content with the time allouted to them,
many steal into the woods to some of the lakes, and if it's
frozen and noisy, put the dogs out in November as

^{*} In his amusing letters of a "Besieged Resident," Mr. Labouchera applies the word "chase" to angling for gudgeon in the Seine, during the Siege of Paris in 1870-71.

and out of season, then it is but useless talk and twaddle about game laws for the protection of deer. It just suits the hounding fraternity as it now stands, and could not be much improved upon for them, if stricken from the statute book. I would suggest that the law be amended, cutting down the open season for the hounding of deer one mouth, i. c., make the close season to commence the 1st day of October, instead of the ist of November, and double the penalty. Such a law only can be of any account.

only can be of any account.

Cold Scent.—Editor Forst and Stream: A friend of fine, an ardent sportsman, who has followed the hounds from his boyhood and who is a close observer of game and its habits, informed me last fall when hunting with his beargles, that the scent left by the track of a fox or other animal in the soft snow or ground, if the track be frozen while still fresh, will not be given off until the track is thawed, when it will be taken by the hounds and followed as readily as before it was frozen. In other words, the scent lies dormant while the track is frozen and is brought into activity when thawed. He further asserted that a fox or other animal in passing over "clear crystal ice," left no seent whatever, and that their scent could not be followed by the keenest nosed dog. Are these statements correct?—Sancin Panza. [We have had the same experience with the frozen scent. On one occasion our dogs pointed, being stopped by the scent coming from qualis tracks which had been frozen and were at the time thawing out. It is also true, according to our own experience, that the fox leaves no scent on clear ice.]

Brayer River Club.—Springfield, Mass., Jan. 26, 1882.
—The Beaver River Club held its eighth annual meeting.
Friday, January 20, at the "Old Tavern," West Spring-field, Mass. The club accepted the courtesy of the Rod and Gun Club Rifle Team, by using their two hundred yard range. The gold badge held by R. A. Whipple, of Adams, Mass., was won by A. L. Phillips, of Adams, Mass., The following scores were made: Phillips 110, Crondall 105, Brownell 104, Wilson 102, Whipple 101, Cooley 100, Briggs 88, Williams 88, Mayott 85, Cranston 83, Jones 82, Follett 76, Kimball 73, Moore 67. The club then sat down to a good supper, carefully prepared by landlord Belden, after which the following officers were chosen: President, Dr. W. G. Brownell; Vice-President, H. K. Cooley; Secretary, F. P. Doolittle. It was voted to hold the annual field day in Adams, Mass., July next. The remainder of the evening was given to sketches of last summer's trips to Canadian woods, Adirondacks and the wilds of Maine.

Game in Sullivan County, N. Y.—Wild ducks are found in quite large numbers on the Long Pond and Mongaup Ponds during Eeptember, they say, and the tracks of Bruin are found on the mountains during the winter. A fair specimen of his bearship was taken a few weeks ago from an adjacent mountain. He may be seen from the road, chained, near the Shin Creek store. The country known as the head of the Beaverkill, which lies between Morsston, on the Ontario Railroad, and Big Indian Station, on the Ulster and Delaware Railroad, I consider the best groups shooting country board may be had at from \$4 to \$6 a week. To reach these grounds from New York, take the Eric Railroad to Middle-town, thence take the Ontario Railroad to Morsston, then stage cight miles to Shin Creek or any point you desire further up the Beaverkill River. Mr. Lynch keeps a good boardinghouse—or Murdock and several others at Shin Creek—and the farmers all through that section, as a rule, are a Jolly good set of fellows, ready to accommodate any one.—Doctor.

LAWS THAT WOULD BE LAWS.—Trenton, N. J., LAWS THAT WOULD BE LAWS.—Trenton, A. J., Jan. 4— Among the numerous bills brought forward in the House were one making drunkenness sufficient cause for divorce; forbidding the killing of woodcock and ruffed grouse for five years and more to come, and one requiring all physi-cians' prescriptions to be written in English, under a penalty of one hundred dollars.

Sea and River Hishing.

A tug-a tug! With face ten times flushed and pale by turns ere you could count ten, he at last has strength in the agitation of his fear you could count ten, he at last has strength in the agitation of his fear and joy, to pull away at the mouster; and there he lies in his beauty among the gowans and greensward, for he has whopped him right over his bead and far away, a fish of a quarter of an onnee in weight, and, at the very least, two inches long! Off he flies on wings of wind to his father, mother and sisters, and brothers and cousins and all the neighborhood, holding the fish aloft in both hands, still fearful of its escape; and, like a genuine child of corruption, his eyes brighten at the first flush of cold blood on his small funny fingers. He carries about with him, up-stairs and down-stairs, his prey upon a plate; he will not weak his angle hefore dium; for he aveit in the effection can be a supplied to the control of the control acous with min, up-stairs and down-stairs, his prey upon a plate; he will not wash his hands before dinner, for he exults in the silver scales adhering to the thumb nail that scooped the pin out of the baggy's maw; and at night he is overheard murnuring in his sleep—a thief, a robber and a murderer, in his yet infant dreams.—Christopher in his Sporting Jacket.

BROOK TROUT IN THE LOWER PENINSULA

BROOK TROUT IN THE LOWER PENINSULA.

BY DR. J. C. PARKER, GRAND RAPIDS

From all the information I can obtain, I feel quite confident in making the assertion that twenty-five years ago there were no brook trout on the "Lower Peninsula."

At that time I was most interested in the ichthyology of the State, collecting and classifying, so far as I could, whatever came to hand, and making inquiries of all who might be interested as to what could be found in places inaccessible to the ordinary observer. To the question often asked of huntors, trappers and surveyors conversant with the "streams of the North," "Are there any brook trout up there?"

The universal answer was, no!

They often described what they usually called "Michigan trout," but which I then know by their descriptions was no trout at all, and which we all know now to be the "Grayling."

The first definite information I had that there were rrout in this part of the State was when a party from Grand Rapids wend up to what was then called line lifter, now the well-known Jordan, and who on returning brought back the first spectness of brook brout that I have seen in the State. I was well aware that they were found in the "Lake Superior region," and on the south shore of the "Upper Peninsula," in the Carp and Time rivers and other streams near Mackinaw; thu this was the first that was known of them on this side of the "Straits," and I have never doubted but what they have found their way across the "Straits" and become domiciled in the "Jordan" and other streams less than twenty-five years ago, for it seems very improbable that a fish so distinctly marked as the "Brook trout"—one so universally distributed over the whole world, so much so, indeed, that if a man was

to say "that he had never seen a brook trout" he would have been put down at once as coming from a warm climate—could have been in these streams any appreciable length of time without being discovered by some one who would have known

been put down at once as coming from a warm climate—could have been in these streams any appreciable length of time without being discovered by some one who would have known him at once.

Another circumstance tending to contirun me in this opinion is this significant fact—that at the time when the discovery of trout in these streams was first made there were fully as many grayling as trout; but within the comparatively short period of years the former have so completely disappeared that to catch a grayling in any stream where front are abundant, is a very rare occurrence. And this also leads me to the conclusion that the beautiful fish is doomed to an early and complete extinction. Only a few years, comparatively, and it will only exist in the traditional remembrance of the 'oldest inhabitant' and the 'pickle jars' of the 'naturalist," and the 'Manistee' and 'Samble' will know them no more forever; its predacious and voracious cousin will have been at once its executioner and its tomb.

But in the stern economy of nature, that accords the front ranks to the strongest, there is also a just law of compensation, and if these streams are to have new tenants, they are also destined to find their way into the thousands of other streams scattered throughout the State that at present give no economic results to man in supplying him with either the necessities or luxuries of life. To any one who will take the rouble to examine almost any county in the State, and count the number of sections teach representing a mile in length erosed by a stream of sufficient size to nourish and sustain the brook trout, will find the aggregate number of miles somewhat of a surprise.

Going over twenty-four counties, taken us an average of the each county of streams that might be made available by proper care and judicious protection for the successful growth they are fully able to take care of and propagate themselves to the full extent of their food supply if judiciously 'let aloue.'

It has been an open question as to whether the trout

thrive so well and make so large a growth in small streams as this, for they are fully able to take care of and propagate themselves to the full extent of their food supply if judiciously 'let alone."

It has been an open question as to whether the trout would live and multiply in the warmer waters of the southern portion of the State. But the experiments made by the State Fish Commission and private individuals has demonstrated beyond a question that they will.

Admitting them that my calculation in regard to the number of miles of available streams is correct, and taking the 68 counties in the "Lower Peninsular," and we have 6,500 miles of trout streams.

Now, if gach mile of stream will yield five pounds of fish per annum—which I think a very moderate estimate—[A very small estimate—En] we will have 34,000 pounds of delicious food from waters that now yield nothing.

The cash value of this product at 25 cents per pound—a price they would not in any of our metropolitan inarkets—would yield the handsome little sum of \$5,500, a sum more than stillicient to keep the Fish Commission up to its full "fighting weight."

There is still another value that attaches to all our game fishes, and to the trout more especially, and that is the "fun value." Now, 1 believe that a dollar's worth of fun is worth just as much as a dollar's worth of pork and beans, to any one who pays for it. The only difference is that we must have pork and beans and we "don't have to" go fishing.

But, when by energy, economy and frugality we have secured a sufficient amount of pork and beans, for several content of the company of the content of the some place where we can get a dollar's worth of "fun."

Just what shape the article will come in is just as varied as the tastes of those we do purchase. But no matter what shape it comes in, whether you call it recreation, sport, amusement, needful exercise, enjoyment or happiness, it all means but one and the same thing, and that is, the gratifications of one sown self, in self's own way; and our p

sest to life that never comes to him in digging potatoes or husking corn.

A hungry man may go to his henroost and strangle a pullet for his dinner, and it will satisfy his hunger. But let the same nungry man "nip" a ruffed grouse, as it whirs out of the brush like a bullet, and when he satisfies his hunger with it, the remembrance of the handsone way he "brought it down," will sweeten every morsel as no other sauce on earth can. We all know what a keen enjoyment there is in it, a sweet hint of the romance of wild life, that is beyond any money value, so much is it a part and parcel of ourselves; and so much does it satisfy that "home-sickness" that is in the hearts of the most of us, that longing for the solenn woods and the rushing streams of our old aboriginal ancestors.

And yet how many there are that live and die—dare we say happy? who never have a hint, even, of what comes to the soul of a true sportsman. How often has the sneer been thrust at you by old Gunnybags when you have returned from a fishing trip, "Well, I guess those ere trout must have cost you about two dollars a pound." Well, admitting they did, the one who caught them knows that he got more "fun," more genuine enjoyment out of his two dollars than old Gunnybags ever got out of anything in his life, unless it was in knocking his wife or scolding his children. Those two dollars a pound for trout mean to you a new lease of life; a building anew of those energies that made the getting of any money in your life possible.

And thus would I add to the money value of the trout as a

life possible.

And thus would I add to the money value of the trout as a food fish, the other unknown quantity in the problem, its value in "fun," which can only be calculated by each individual's capacity for enjoying it.

food fish, the other unknown quantity in the problem, its value in "fun," which can only be calculated by each individual's capacity for enjoying it.

Mr. Frank N. Clark agreed with Mr. Parker's paper that brook trout will live in many of the southern Michigan streams but not all, and where the brook trout cannot live, the Calafornia trout will. The latter fish like cool and rapid running streams, but will live in warmer and slower ones. He believed the least slower ones. He believed the least streams for trout were those having plonty of small cold brooks running into them, and places where the fish can go back into the deep holes where the water is warmer. Trout will live in water, at about \$0 degrees, and the speaker caught fifty of them at his hatcher; and took spawn from them, in a stream having a temperature of \$2 degrees.

Mr. A. H. Mershon agreed with Mr. Clark concerning trout living in warm water, and cited an instance of his having nine orten years ago planted trout fry in some small streams running into the Tobacco river, where the water gets very warm in summer, and he had since caught them from \$0 to 16½ inches long of different sizes, showing the original plant had bred and multiplied.

Mr. Clark said that many persons doubted that the large speckled trout found in Lake Superior were genuine brook trout, but he had seen and eaten them that were caught out of the lake in pond nest last summer, some of them weighing 4 to 5 pounds, and he knew them to be the genuine brook trout, and the latter paid no attention to either as long as they were fed, and when that was discontinued they gobeled them all up. Brook trout will not eat other fish. He had

recently proven this by taking 12 brook trout (yearlings), 12 California trout and 12 small carp, and penned them all up together. The fish were not fed for thirty days, yet at the end of that time he counted out the whole number put in. He had put the largest of his California trout, 20 inches long, in with the yearlings with perfect safety.

President Holmes was glad to hear questions pertaining to game and food fish discussed, it being to many persons as interesting, and to some more so, than those of the rame of the woods, the fields and the air, and he called for a free expression of opinion from all present. It was a matter of great interest to him if brook trout could be grown nearer our homes, menioning some in streams near Grand Rapids which were doing finely. He had no doubt there were hundreds of streams in the southern part of the State where California and brook trout would do linely.

Mr. Clark never knew of an instance where brook trout were planted and not seen within two years, and cited cases in proof, and urged an effective law to protect stocked trout streams.

Mr. Clark never knew of an instance where brook trout were planted and not seen within two years, and cited cases in proof, and urged an effective law to protect stocked trout streams.

Dr. Parker confirmed all that had been said concerning the rollific qualities and hardy habits of the trout in streams of varying temperature.

In reply to a question of Mr. Rogers Mr. Clark said that pickerel, as a rule, do not run up small streams inhabited by trout, but preferred deeper water.

Mr. Rogers mentioned an instance where trout escaped from a hatchery near Jackson, to a pair of lakes where the water was pure and cold, never varying much from 45 degress, and were never heard of afterwards, but thought they might have perished for want of feed. He thought neither grayling or trout would eat the other if they found sufficient food and favored the artificial propagation of the grayling in the southern streams.

Dr. Parker said the case spoken of by Mr. Rogers was the only one had ever heard of where trout had escaped from a hatchery without propagating in new waters.

Mr. Osgood, of Battle Creek, mentioned a case of where fifty grayling, 9 to 12 inches long, were planted in a stream six miles above Marshall, about two years ago, and had never been heard of since.

Mr. Clark thought the grayling failed to appear not on account of lack of food in the river.

Mr. A. H. Mershon thought brook trout were perfectly able to take care of themselves, and had found all kinds of river ish in the same stream with broot.

Secretary Mershon inquired of Mr. Clark if it had not been found that grayling would live in three or four streams in Michigan, viz: the Sauble, Manistee, Pere Marquette, etc., and also that they could not stand as warm water as trout. He believed that grayling would die at about 70 to 72 degrees, while trout would strand 10 or 12 degrees more.

Mr. Clark thought grayling would not live in water over 80 degrees.

Dr. Parker mentioned an experiment made by Supt, Potman several vears is got to est the relative endura

Mr. Olark thought grayling would not live in water over 80 degrees.

Dr. Parker mentioned an experiment made by Supt. Portman several years ago to test the relative endurance of the grayling trout and some other kind of fish, in which Mr. P. put an equal number of each in a small pond, and after a long time found the graylings all clive and the others all dead. He thought grayling would live in warmer water than the trout, and attributed their failure to propagate to the fact that they need a peculiar food and are difficult to handle in getting spawn from them and propagating them artifically.

President Holmes related his experience upon the Jordan and Bordman rivers fourteen years ago, when grayling, as well as trout, were plenty, where now the grayling was almost extinct. A study of the anatomy of the two fish showed that the grayling had not a preducious mouth and the trout had, and like all of its family, was a preducious fish, and this satisfied him that the trout had made food of the grayling. He did not believe that trout and grayling would thrive in the same stream, and contended that streams where the grayling will live should be reserved for him alone.

A TRIP TO BROWN'S TRACT.

A TRIP TO BROWN'S TRACT.

LAST JUNE I went up to my old camp ground on the Fulton Chain, in Brown's Tract, on my annual fishing trip, Going early, I often have to go alone. Sometimes that's the best way; you can go where, when and how you like, without having to consult a "wayward pardner"—and then I have a special partner up there in my guide, Honest John B—, who is a whole team and a half all by himself. So, when John and I get together, we don't calculate to be lone-some, and then net result is a real pleasant time, and, to me, a decided profit in health, pleasure, change of scene, good fishing and good feeding.

According to appointment John met me at Boonville on the morning of June 2, and after devoting about two hours for breakfast and calls on old friends, we started for the woods on one of Charley Phelps' fast-line buckboords, so called because everything is tied fast with a line, else when you got to the end of the line, your baggage would be scattered all along the line, and that's twenty-six miles long.

To nea a ride in the country is a rare treat, living as I do in the great city, and rarely getting out of it, all the sights and sounds of the country are new, fresh and over varying. Driving along the road, the stone walls, the birds in the fields, the chipmunks running along the fences, the cattle and horses, the people you meet, the streams and rocks and woods are always fresh. And then the feeling of exhilaration of going on a vacation, a rest—a change from the every day-humdrum of a busy life—stirs one's blood and makes me young again. And in this I am not alone; others have the same feelings and enjoyments.

After a pleasant ride of twelve miles the wagon stops, and we dismount at the Moose River House, which any school-boy can tell you is a house on the bank of a river called Moose. Why, I can't tell, but suppose at some time in the past animals of that succles were to be found along here—but hubays not so now. However, we were gleat to reach the house, for it is the last one on the road befo

this house have a very good house, even if it is the last.

"Now, then, boys; all aboard"—this is next in order—so we take our seats on the buckboard, and, with a crack of the whip, we are off. A few rods from the house we cross the Moose River on a ferryboat, and then we are in the woods in reality. Anybody can tell you what the woods are, but can anybody describe a wagon road through the woods? I doubt if full justice can be done the subject; it is vast, it has length, breadth (not much), depths put that in the plural) and heights (also plural). Well, get firmly braced on your seat and keep an eye open for any obstacle, such as a pebble set up on end in the road, or any small wetness of a dubious appearance, and as you strike the one or sink down into the other, try to suit the motion of your body to the motion of the wagon, and you will likely miss it every time.

We had hardly got started when some of the logure

up how many miles we were from the erd of the journey, and I tell you that's the wrong way to do. It is astonishing how long the road gets to be before you get to the last milepost if you go to furning on it. But after getting bounced over rocks, sunk to the bottom of mud-holes, up over endless hills, down the other side of them, glad at times to get off and walk, we finally got to our journey's end pretty well shaken up, but wonderfully well preserved when you consider what we had gone through. And right glad we were to see, as we swung around a turn in the road, a rough frame-house a few rods ahead of us. This is the Forge House at the foot of the Fulton chain of lakes. We are not strangers here; every-body knows us, and they are willing, yea, anxious to give us all we can pay for, and we propose to get even with them by getting our money's worth in the way of a supper, for our noonday meal is almost forgotten now.

Our destination was a few miles from the Forge House, and, having a little daylight left, we started soon after supper, and taking our seakin John's new boat we were soon spinning up the lake. On, the pleasure of the scenery of these woods and waters, now so familiar—every rock or point, every bay and stream is greeted as an old friend. Soon the log cabin beneath whose roof we have so often rested, comes in sight, and ere long we are again within its four walls, only to meet a glad surprise, for our old friend, Paul Jones, had heard of our coming and was here a head of us to keep us company, and had a good fire burning so that we might be comfortable, contented and happy.

The fishing in this section early in May is very good, trout being hungary and randy for bait. The salmon trout are also numerous and are taken quite freely by trolling, either with minony or the artificial spoons. When the weather grows warmer, along in June, you have to work harder to get fish but that only adds zest to the enjoyment. You feel that you must be snaar enough to beat them some way or other, and various are the ex

AN AUTUMN SUNSET.

AN AUTUMN SUNSET.

WHEN is the best time to read the book of Nature?
When autumn turns the leaves? A pretty thought,
certainly, let us see how far practice agrees with its theory.
Lake George in late October. The day had been one of those
perfect samples of Nature's work which she often allows us
mortals to enjoy at that season. She had turned the leaves; we
were to read, and forgot ourselves in the contemplation of the
picture before us. Pulling out of the lengthening shadows near
the shore, far on the bosom of the lake into the full cloy of the
sunset, we draw in the oars and abandon ourselves to the
full enjoyment of the lovely scene. The glassy surface is unbroken, save by the gentle undulations caused by the boat as
she glides along, slowly losing her momentum, and passing
with the ripple she has made into that calm quiet so in keeping with her surroundings and the hour. Done Island is
abreast of us, and its gorgeous dress of exquisitely colored
foliage is finely brought out by the more subdued and restful
tints of gray and brown on the opposite shore, relieved, here
and there, by the brilliant blush of maples and the occasional
modest glow of the birchee that have found a home on the
rugged mountain sides, whose summits are sharply cut against
the clear blue of the sky. Great mounds of snowy cloud float
slowly along, as though loath to lose sight of the enchanting
picture, and while ve trace noble easthes and turrets in their
outliners, glisten in their purity, and east the reflections of their
soft masses in the mirror spreading below. The spell is upon
us, and we yield to its seductive charms. An occasional
hreath ruffles the water for a moment, then loses itself in a soft
sigh, lending additional strength to the depth of our dreamy
hreath ruffles the water for a moment, then loses itself in a soft
sigh, lending additional strength to the depth of our dreamy
hreath ruffles the water for a moment, then loses itself in a soft
sigh, lending additional strength to the depth of our dreamy
hreath ruffles

Now the darkness deeper Night is drawing nigh, Shadows of the evening, Steal across the sky.

A gun shot rings out over the lake and breaks in upon our reverie, and as its echoes fly among the hills, we take our way to the landing stage, tie our little craft and leave the close of this short chapter from Nature's book to the gathering dusk, in which the stars are already beginning to sparkle and flash with a freshness and brilliancy only seen in clear autumn weather.

ANOX.

A MARINE BAIT WORM.

A MARINE BAIT WORM.

OCEANIC, N. J., Jan. 17.

Edilor Forest and Stream:

While launching my little Rushton for a spin over the river this morning, I discovered what seems to me to be a species of angle worm. They look, however, something similar to the sand worm, minus the nippers. There were nearly one bushel of these worms in one spot, and all along the shore on the south side, and in some few places on the north side of this river they are strewn. You will oblige me by giving a full description. I cannot get the angle worm to make a comparison with, so I appeal to you.

We sent the worms to Mr. True, of the Smithsonian Institution for identification, in order to get his opinion as to the species, it being evident, as our correspondent states, that they were not the common sand worm, Avenicola, used by the fishernen. Mr. True writes as follows:

"Your box of worms arrived yesterday in good order. The species is Rhymchobolus dibranchiatus (Ehlers) Verrill. Its range, according to Verrill, is from New Jersey to Massachusetts Bay. I believe that Webster found it on the coast of Virginia. It appears not to be an uncommon species. You will find reference to this worm in Part I. Fish Com. Report, p. 596; and figures of the feet and head on plate X (figs. 43, 44), of the same volume.

Frederick W. True, Ass't in Helminthology.

Fish Protection in New York.—The Albany Journal says: "Special Officer Brayton, of the Game and Fish Protective Association, has returned from a visit to Onondaga and Oneida lakes, where he has been endeavoring to break up the practice of violating the fish and game laws in that section. The officer says the violations are frequent, some of the fishermen going so far as to use nets. They send their fish to market in boxes labeled poultry, and in this way have been very successful in evading detection. Seven persons who have violated the law at those lakes have been indicted, and will be tried during the coming months." The Syracuse Standards says: "Some nonths ago, George A. Crownhart, proprietor of the Ocean House at South Bay, and Game Constable W. H. Lindley, of Canastota, caused the arrest of several parties who had been engaged in oblique fishing on Oneida Lake. The somewhat exciting events immediately

preceding the arrest were published at the time. It now appears that one Charles Loskey has been quietly at work endeavoring to procure the indictment of Crowhart and Lindeyin Oswego county, on a charge of assault with intent to kill. The little game was promptly disposed of and the plans of Loskey have come to naught. The grand jury have refused to shield the violators of the law."

THE INON PIER POUND NET.—The great net which was stretched along an iron pier on the south side of Long Island near Napeague beach, has fizzled out. The thousands of tons of fish which were to be taken weekly remain to be heard from. The sea took the net out from between the iron columns several times, and the stockholders have had a meeting expressing their regret. The theory now advanced is that the fish only keep in shore when rivers are full of rain water, when they bear to the ocean organic matter on which fish love to feed. In seasons of drought fish go far out to sea for their food. They said but little about the filling of the meshes with sea-weed until it formed a dam which the tide carried away, or of the storms which operated in much the same manner; but that is a subject that future investors in the stock can easily learn for themselves.

THE LAMPREY—Niagara, Ont.—The fishermen are catching a great many sturgeon this winter. One of the sturgeon weighed 137lbs, and had attached to its body a "lamper eel" (local name). The eel was about eight inches long; they have large sucker mouths, by means of which they fasten on sturgeon, suckers and all bottom feeders. If you would like have one, the next one I can get hold of you shall have.—W. S. L. [The lamprey is a true parasite and is not an eel, It is not even distantly related to the eel, but is nearer to the worms. It lives by sucking the juices from fish, and the circumstance is not at all uncommon.]

Maine Law Enforced—Monson, Me., Jan. 14, 1882.—
Editor Forest and Stream: Yesterday Deputy Warden
Nahum H. Smith, of Greenville, paid \$35, it being one-half
of fines paid him for the violation of the fish laws of Maine
by two poachers who caught trout a few days ago on Moosehead Lake. One-half of these fines go to the warden and
one-half to the county. The total amount that this infraction
of the law cost these gentlemen was \$75. The men who
were fined were natives and not visiting sportsmen.—J. F.

Kill Your Fish.—Dutch fishermen, according to an exchange, kill their fish as soon as they take them from the water, preventing them from dying slowly and having their tissues softened. The superiority of the flavor of the fish killed by Dutchmen, when compared with those which die slowly in French markets, is, so it is said, very great.

Lobster Law of Massachusetts.—A law went into effect on-the first of January in the State of Massachusetts which made it a criminal offence to capture, buy or sell a lobster, between June 20 and September 20, under a penalty of from ten to one hundred dollars, or imprisonment from one to three months.

Hishculture.

REPORT OF THE KENTUCKY COMMISSION.

REPORT OF THE KENTUCKY COMMISSION.

THE third biennial report of the Fish Commission of Kentucky for the years 1880-81, shows that the interest in fish-culture increases, and that applications for fish to stock streams and ponds are received in greater numbers than it is possible for the commissioners to supply. Letters from various parts of the State are received in greater numbers than it is possible for the commissioners to supply. Letters from various parts of the State are published attesting the success of previous plantings. Lake trout are doing well in the headwaters of Lattle River and in Red River, and the wall-eyed pike are thriving in Pond River.

Mr. J. G. Stephens, of Holt, writes to Mr. Wm. Griffith, President of the Commission, that the carp are doing so well that the people are astonished at their growth, and says "I don't see why we can't raise them instead of chickens and ducks and much cheaper. There are hundreds of ponds in this and Meade counties where they might be grown with great success, if the farmers would give them a little attention. "The most astounding growth is thus recorded by Mr. L. Washburn of Linden, Jefferson county, who says: "The Germin carp you sent to me were placed in my pond April 19, 1881. They measured when received from two to four inches in length. August 10, 1881, just four morths and one day after planting them, they measured thirteen and one-laft inches in length, and weighed two and one-eighth pounds. They were fed.

Correspondents complain that the distilleries are killing more fish than the giant powder does, and one of the commissioners, Dr. W. Van Antwerp, also makes the same statement. The California "mountain" or rainbow trout have been distributed to a limited extent, from four thousand fry turnished by the U. S. Pish Commission. Shad have been caught at the Falls of the Ohio and were sold drilly at Louisville during the entire season, where they are preferred to either Potomac or Comecticut shad on account of their freshness. They were originally plant

THE CONNECTICUT COMMISSION.

The CONNECTION COMMISSION.

In our last issue we noted the re-appointment of Dr. W. M. Hudson as one of the fish commission of Connecticut. Since that was published we learn that the Governor has also reappointed Mr. Robert 6. Pike for four years, from March 8, 1882. Both Dr. Hudson and Mr. Pike were originally appointed in 1869, and have served since with great credit to themselves and advantage to the State. The commission now stands as follows: Dr. W. M. Hudson, Hartford; Mr. Robert G. Pike, Middletown; Mr. G. N. Woodruff, Sherman.

OYSTERS IN OREGON.—Last week, says the Olympia Transcript, Messrs. S. Barker, C. Ethridge and an oysterman from Shoalwater Bay, rigged up a dredging apparatus, and proceeding down the bay to deep water, commenced operations and succeeded in finding some of the largest oysters yet found on the sound. How extensive they are is not yet ascertained, but the trial demonstrates that larger and finer oysters exist in the deep water than is found in our shallow bays. We look for this to be a huge business in the future.

CALIFORNIA.—The San Francisco Call says that Fish Commissioner B. B. Redding states that 50,000 Eastern trout and 500,000 white tish eggs have been forwarded from the East to this city for distribution in the lakes and rivers of California. Of the trout 20,000 have already been received and are being hatched at San Leandro. The demand for carp, he says, from

all parts of the State has been very great, but there will not be any for distribution until next fall. The delay is due to the breeding fish having been placed in a pond of artesian well water in Alameda. There not being any animal life in the water the earp did not breed, and as no vegetation formed on the edge of the pond there was no spawning place for the parent fish. An examination of the pond substantiates these facts. The fish were at once removed to a lake in the hills of San Mateo County, and it is expected that by next fall there will be plenty of small try for discribution. Those person making carp ponds will no doubt profit by the experience of the Fish Commissioners and not put the fish in ponds of well water.

TRAINING vs. BREAKING.

IN TEN CHAPTERS-CHAP. X.

WE have given in the preceding chapters as well as we were able the outlines of the course that for more than a quarter of a century we have successfully pursued in preparing our dogs for lives of usefulness, and we believe, yes, we know, that if any one—we care not how wedded be may be to the force system—will but give our method a fair trial, hencefort the whip and check cord will form no part of his kennel appurtenances for not alone does our system exercise an ennobling influence upon our pupit, thus making him much better qualified to become our companion, but the better, finer feelings of our own nature are not blaunted and trutalized by the crucil associations necessarily present when the lash is applied to the shrinking form, nor is our erjorment of the pleasures of the field marred by constantly recurring struggles with the sharer of our sport who should be our obedient as well as loving friend. As the flon. George Ashman once remarked to us, "The humane system and the force system both necomplish the result of bringing man and dog toward the same plane, the one by elevating the brute, the other by lowering the humane creature."

In all our lessons we have endeavored to impress upon the reader the great importance of carefully studying the disposition of his pupil in order that he might intelligently apply their teachings. We have also tried to show the paramount necessity of a very cautious advance at each successive step. Yet so very important a matter do we deem this that we cannot forbear again calling your attention to it, and again cautioning you to use the utmost care in all your feesons, and to so manage that your dog shall not become overtrained, for this, although quite common, is a very serious fault, and one that will require a long time to overcome, if, indeed, you can ever quite eradients it; and in order to secure that cheerful, willing obedience that is so desimble, it will be far better that you should devote pleaty of time to the proper development of your pupil than by undifferent or

success encourage others to by our annual statement task, we are painfully impressed with its many shortcomings and imperfections; the most serious of these is the failure to express the ideas that we wish to convey in a satisfactory manner. Although to the best of our ability have we endeavored to impart the knowledge gained by a large experience, yet we feel that we have but crudely and imperfectly accomplished

our purpose. There appears to be an indescribable, intangible something that is lacking and that our pen is unable

to portray.

There is a mysterious and subtle power, inherent in some There is a mysterious and subtle power, inherent in some and only gained by others with long experience, that enables its possessor to exact an instant and willing obedience from the lower animals by a single word or look that others cannot compel by vociferous commands or even by blows. We have already noticed that those who possessed this peculiar gift appeared intuitively, as it were, to understand the nature and disposition of the animals under their care, and that there was invariably an almost electrical and harmonious sympathy between them. Would that we could reveal the secret of this mysterious power; then could we lay aside our pen with pride in the belief that we had laid at the feet of the sportsmen's shrine a worthy offering.

THE ST. JOHN BENCH SHOW.

THE ST. JOHN BENCH SHOW.

[FROM A SPECIAL CORRESPONDENT.]

MCDONALD'S CORNER, N. B., Jan. 23.

A T file second annual bench show of dogs, held at St. John, N. B., from Jan. 17 to 29, under the aspices of the New Brunswick Foultry and Pet Stock Association, there were 149 berties (against 104 the year previous) in the following classes: Mastiffs 3, Saint Bernards 3, Newfoundlands 13, greyhounds 3, deerhounds 2, pointers 3, settiers 12, Irish water-spaniels 2, retrievers 2, clumbers 2, cockers 9, field spaniels 10, fox-terriers 7, olicies 9, Dalmatian 1, bull 1, bull-terriers 18, sky-terriers 7, steins 4, bull 1, bull-terriers 18, sky-terriers 7, steins 4, bull 1, bull-terriers 18, sky-terriers 7, steins 1, bull 1, bull-terriers 18, sky-terriers 7, steins 1, bull 1, bull-terriers 18, sky-terriers 7, bulked and tan 4, Yorkshires 8, Italian grey-bound 1, miscellaneous 20.

The judge was Mr. George Walton, of Boston, and his awards, though very satisfactory to the majority, of course excited the wrath of a number of individuals who each possessed "the best animal in the show." The judge said that there had been a decided improvement "both in the quantity and quality" of animals exhibited since last year, and that a Scotch staghound shown by A. Berryman, could scarcely be excellent specimens, and in this continent. A pair of clumbers exhibited by Thos. Eagan of Halifax, N. S., and a bull-terrier shown by Snider Bros, of St. John, were pronounced excellent specimens, and he also commended Mr. Hazen's Newfoundland dog very highly. Mr. Alfred Ray, of Fredericton, exhibited a mastiff which weighed 190 pounds. The following are the winners of the Association specials of \$10 cach for the best animal, irrespective of age or sex, in each of the seven largest classes in the show:

Charles Bustin, Yorkshire terrier dog.

F. B. Hazen, Newfoundland dog.

John McMillan, Scotch collie dog.

Salter Bros. bull-terrier dog.

T. A. ameeting held by the Association on the second day of the show the following officers were elected: Col.

WHAT THEY FOUND IN THE DOG.

INDIANAPOLIS, Ind., 1882,

Edilor Forest and Stream:

Iwound like to report a case of unusual interest. It may be nothing new or strange, but I have never heard of a case similar. A friend has a very valuable pointer dog, the best I have ever shot over. On Wednesday evening, while cating scraps obtained from the but-hor shop, he suddenly stopped eating and commenced howling as if in great pain, and refused to eat more. My friends supposed he had swallowed a piece of bone, but could find nothing in his throat, nor did the dog show any appearance of being choked. He walked stiffly and stretched hinself as if something hurt him internally. On patting him on the side he howled as if very sore. Next morning would cat nothing, but drank a large quantity of water; did not appear to be feverish; walked with body curved to left side and imped in left fore leg. Howled greatly at times as if in extreme pain, again would appear to be easier.

On Friday morning a small lump appeared on left side op-

FOREST AND STREAM.

posite the stomach, about the size of the end of a thumb. Appeared to be very sore. The dog was now very weak and would eat nothing. Drank water or milk freely. Lump remained about the same size until Monday morning, the dog in the meantime growing steadily worse and weaker.

Not being able to walk, my friend carried him to the buggy and brought him to my office, the dog showing great evidence of pain on being handled. Upon examination, I could, with considerable pressure, feel something under the lump and between the ribs. At my friend's request I cut the lump and between the ribs. At my friend's request I cut the lump and he saying that the dog would die anyway if something was not done for him. Upon opening the lump a small amount of matter escaped. By inserting the finger between the ribs I could feel the sharp point of something. With a small pair of forceps I got hold of this, and, with considerable difficulty, removed a common wooden skewer-pin, five inches long, and about the size of a common slate pencil—such pins as butchers use to keep a roast of beef in position while roasting. The sharp end was between the ribs, while the other, or blunt end, was still in the stomach. The contractions of the stomach had evidently forced the sharp point through the walls of the stomach and between the ribs. This was no doubt the cause of the dog howling so at times, the stomach irritated by a forcign substance, contracting, as in voniting, forcing the pin further and further through, and giving the dog great pain. The operation was performed without chloroform. The dog seemed greatly prostrated for a while—lying very quietly—but soon revived and seemed better. After allowing him to rest, my friend seemed better. After allowing him to rest, my friend seemed better. After allowing him to rest, my friend seemed better that pin in his accustomed place under the seat. His appetite returned at once, and in eight days after I shot quali over him, he never working better. He is now in prime condition, the only evidence of h

CONDITIONING FOR BENCH SHOWS.

insists that he knew that it was the cause of his suffering. S. H. M.

CONDITIONING FOR BENCH SHOWS.

Rétitor Forest and Stream;

A few hints as to the means to be taken to produce good show condition may not be out of place, here and now.

If suffering from skin diseases, a cooling and somewhat laxative vegetable diet must be given, with plenty of exercise, and proper remedies in severe cases. In mild cases washing with tar soap will probably be found effectual, always combined that is not be best if changed so often as not to be broken up in the kennel—and the kennel should be cleaned and disinfected thoroughly. If the dog house is not large enough to permit every corner of the interior to be reached, you should either diseard it entirely and build answ, or else funingate it thus. First, stop all crucks, then take an old pan—one that will not melt, apart—and put therein a quantity of burning coals; an annofful of sulphur, and naft against the entrance a board of sufficient size to cover it entirely and closely, with, perhaps, an old piece of blanket between to prevent the escape of the smoke. Of course all straw must be removed before this operation is begun, and as much of the remaining dust as it is possible to reach should be swept or shaken out. After the lapse of an hour or more, remove the board covering the currance and place the kennel where it can air thoroughly considered the dorse and place the kennel where it can air thoroughly considered the dorse in the contract with the natural moisture of the soil. The bottom musts be tight, without cracks, so as to exclude all upward drafts of air, and the roof should extend so far over the door as to prevent rain and snow from beating in. A house sufficiently large for man and dog both to entermine the door and the position that sunshine can reach it during much of the day, and have it raised from the growth of the day in the sunshine can reach it during much of the day of the dog alone. A description of a admitised his position that sunshine can reach it du

Smooth-coated dogs need not be washed as often as their long-haired brethren, but both should be groomed alike, with the exception of omitting the comb from the short-haired animals outfil. First comb, then brush, then rub with your salt-sack cloths and a chamois skin, if you choose. Go through this every day, but do not at the show rub as though you were doing it for your life, as we have an impression that it exhausts a dog and causes him to present a dull appearance before the judges, if overdone. Do not use much oil at any thne—not more than two drops for a setter, rubbed in the palms of the hands and applied between the combing and the brushing. Olive oil is a good kind. Beware of letting your eagerness to have your dog look his best, cause you to oil him too heavily at the show, as in that case you might be adjudged guilty of "faking," and be thrown out of the ring. Better to use no oil at all on that day.

at the snow, as in that case you might be adjugged gainly in faking," and be thrown out of the ring. Better to use no oil at all on that day.

A very useful article is the wire brush with flexible back and the ends of the wires blunt; not the stiff kind with sharp wires. This serves the purpose of both comb and brush, and is useful alike for long-haired or short-haired dogs. ALKALI.

LAVERACK PEDIGREES.

wires. This serves the purpose of both comb and brush, and is useful alike for long-haired or short-haired dogs. ALKALI.

LAVERACK PEDIGREES.

WE publish below Mr. Llowellin's protest against a grand-Perolexity, who is undoubtedly the pear of Mr. Llewellin at least upon the dog question. We are at a loss to conceive what object Mr. Llewellin could possibly have in thus traducing the character and impugning the honor of his dead friend, especially when the facts in the case so far as known and nearly all of the circumstantial evidence conclusively shows, that he is very liable to be mistaken. We would like Mr. Llewellin to explain why it is that so robust a strain of setters as the Edmond Castle when crossed with so feeble a sort as he would have us believe the Laverack to be, do not in some one of the progeeny of this cross show their colors, as it is well known that none of Pride of the Borders get have shown a trace of liver, which is the characteristic color of the Edmond Castle setters.

The correspondence in the London Field is as follows:

Mr. Laverack's printed pedigrees, accepted without question as faithful exponents of his method or breeding setters, have created a certain precedent, which has been blintily followed by various persons in the breeding of animals. The blind faith in this false precedent is leading to an amount of "inbreeding" which, if persisted in, must eventually prove fatal to our fine breeds of sporting dogs.

I am in a position to prove that those pedigrees are open to serious question, as are also his statements as to the breeding of his dogs.

Since his statements are not to be received, it follows that schemes and theories of breeding based on them are without foundation. I have therefore thought it right to take the opportunity—which the establishment of a class for "pure Laverack and he prove that show, a copy of which I have have a super race of dogs, uncossed with any other laverack, and the contract of the border; this dogs as not a "pure" have been fride of the border; thi

he always attended to the mating of his dogs himself. For proof that Pride of the Border was not pure "pure," I refor you—

1 To a quotation from a letter of Mr. Laverack's, which appeared in a Chicago paper of March 14, 1874.

2. To a letter of Mr. Robinson's, with whom Mr. Laverack was intimate, in which Mr. Robinson distinctly admits one Edmond Castle cross.

3. To a witness I am prepared to call to whom Mr. Laverack stated that Pride's color (liver and white), till then unknown in the breed, actually was due to his crossing with the Edmond Castle breed.

R. Li. Purcell-Lewellins

I cannot understand why, at this distance of time, Mr. Lievellin should think it necessary to come forward and thus publicly attack the character of a deceased gentleman who was in his lifetime apparently a friend of his. If Mr. Llewellin is correct in his inferences, Mr. Laverack was a dishonest man. Mr. Lievellin cannot, however, be allowed to take away the character of another by merely raising inferences and on perusal it will be found that his letter and inclosure contain nothing higher. Mr. Llewellin's position, had he been armed with absolute proof, would not, I am convinced, under all the circumstances of the case, recommend itself to the majority of the readers of the Field; but, as it is, is letter is remarkable only for the absence of proof. He digs a pit for another (his friend—deliver me from my friends!) and falls into it himself.

Look for a moment at what he considers sufficient to justify his inferences of deliberate dishonesty on the part of Mr. Laverack.

First, he says, "When Pride of the Border came out, I at once recognized him as a cross-bred one." (By the bye, this

his inferences of deliberate dishonesty on the part of Mr. Laverack.

First, he says, "When Pride of the Border came out, I at once recognized him as a cross-bred one." (By the bye, this surely must be taken as an unintentional expression of Mr. Lewellin's admiration of the beauty and purity of Mr. Laverack's dogs.) This is the sort of evidence we are to accept as all that is necessary to scatter to the winds the word and honor of a good old English conteman. It may be very convincing to Mr. Liewellin; but, knowing how dogs are hable to strain back for generations, it is scarcedy good enough for "ye British public."

But now comes his grand coup d'etat, and poor Mr. Laverack's character has gone for ever. Listen! "More than one year after Pride of the Border has first been exhibited, Mr. L. had given his pedigree variously to different people, sometimes by Dash III, and at other times by Fre III." We have no proof of this fact, but we will accept it on the writer's authority; and what then! Simply this, that an old man, seventy years of age, who has bred hundreds of dogs, makes a mistake as to one dog's pedigree, when he has not his stud

book before him. I do not know Mr. Llewellin, and have no idea as to his age; but, whatever be his age, I will venture to assert that, as years roll on, he will find that, as his hair begins to whiten and his forehead to wrinkle, memory's plower will begin to decrease; and if, with memory perhaps slightly impaired, he should ever make a mistake as to the pedigree of any of his own dogs, I hope that no one will be pedigree of any of his own dogs, I hope that no one will be pedigree of any of his own dogs, I hope that no one will be found sufficiently uncharitable to attempt to hold up that mistake as proof of absolute fraud. It is even within the range of probability that Prides's hum night have been served by accident or design, by both Dash II, and Fred III, and hence the confusion in the old gentleman's mind. Be that as it may, this inference is, to say the least of it, quite as probable as Mr. Llewellin's letter, instead of telling in his favor, has, to my mind, a directly opposite tendency. He says: "Mr. Laverack informed me that he had crosses." And again: "He also pressed me not to cross his dogs, but that he had not kept any of the produce of such crossing as his reasen." If words ever did carry conviction of truthfulness and sincerity, surely these do. If Mr. Laverack really had been acting in the dishonorable manner ungested by Mr. Laverack surely had been acting in the dishonorable manner. Mr. Llewellin seems to think, if only he is able to prove that Fride of the Border was not pure, the whole system of treeding, as laid down by Mr. Laverack, would, "once for all, be proved to have no favorable precedent." Even if the pure Laverack, as host whose pedigree Mr. Li is graciously silent? Surely Mr. L. himself should be the last person to real against the Laverack's carolul breeding. What there were not pure, what them? "One swallow does not make a summer." What about the other uncertain a distribution of his pure Laverack. In fact, every dog that he has in his kennel of any note is at least hall averack.

With Prince Itoyai, another pure have seen and the last half Loverack.

If Mr. Laverack's system is such a bad one, how is it that Mr. Llewellin bred from Lill, by Prince? and, if it is such a bad system, how is it that, while it has been kept up for seventy years, the pure Laveracks are still at the top of the tree, such as champion Rock, Emperor Fred, Royal Jock, Prince Royal, Princes, Phantom, Piuzle, and lots of others? I, for one, an always teady to carefully consider any and all facts brought forward as evidences or proofs; but to take off my hat to any man's tipse distill what I never shall do. Highly as I may regard Mr. Llowellin's judgment of the points of a setter, I shall require something more like tangible proof than his letter at present contains before I either believe the late Mr. Laverack to have been a rogue, or his breed of setters a delusion. What can have caused the lotter to be written at all, is to me a matter of PERPLEXITY.

P. S. By the bye, why does Mr. Llewellin single out Mr. Bowers to protest against? I find there is only one dog (Troy II.) in the class that does not count Pride of the Border as one of its ancestors.

PITTSBURGH DOG SHOW.

The judges appointed are as follows:
For Setters, Pointers and Spaniels—Major J. M. Taylor,
Lexington, Ky.
For Foxhounds, Beagles, Greyhounds, Fox-terriers, Collies,
and all non-sporting classes—James Watson, Esq., New York
city.

and all non-sporting cusses—James w auson, page, from a one city.

Dogs will be carried free to and from the show, when they are accompanied by their owners. Exhibitors who come over the Erie Railroad must notify Mr. Jno. N. Abbott, General Passenger Agent, New York, and he will send them a permit. The express companies will, upon pre-payment of their usual rates to the show, return the dogs free.

The entries will positively close on Feb. 25.

The prospects for the show are exceedingly good, as a large number of applications for prize lists have already been received. The prize lists will be furnished on application to Chas. Lincoln, Supr.,

Edillor Forest and Stream: STAUNTON, Virginia, 1882.

I am sorry that Mr. Godefiroy's dog didn't get first. But I think Mr. G. very wrong in writing the abusive and scurriflous card, which he has published against the judges. If that sort of thing is tolerated, it will preclude gentlemen from acting as judges hereafter—and no one but a gentleman is fit to act.

The truth is there is too much money and too much bias in this field trial business anyway. All the capital, etc., of dog-treeders is tied up in setters. The breeders have gone to work and educated the sportsmen up to the belief that the setter is the only bird dog worthy of a sportsman's attention. They have depreciated the pointer, kicked him out of the pale, and bestowed all their care and caresses upon the setter; and now they think they can't recede, and the fear of losing a little money deters them from doing simple justice.

My own notion is that there are good dogs of both kinds, and that one is better suited to certain localities, and to certain kinds of lunting than the other. I believe that for nose, staunchness and bird instinct, the pointer is naturally the superior. For pace, style and other qualities the setter is superior; and as a companion out of the field for a gentleman, the pointer cannot compare with the setter—such at least has been my experience, in the main—have see exceptions both ways. I have a pointer now that is too fast. He has every good quality that a man can desire, and the only fault I ever found with him, or ever heard urged by others, is that he ranges too wide, and hunts too fast. Now, suppose this dog were bred to a fast bitch of good nose, would not the objection urged by setter men soon be obviqued? When the strikes the seed to a fast bitch of good nose, would not the objection urged by setter men soon be obviqued? There is no sense in it. It is not over the fast dog that the good shot and genuine sportsman makes t

MEASUREMENT.

MEASUREMENT.

The subject of yacht measurement, notwithstanding all that has been written on it, seems yet to be involved in much obscurity and confusion, with the effect that even invective and false analogies are sometimes used in the value attempt to clear up a matter that is only obscured by such treatment. A subject possessing so many points, and the points themselves presenting so many isprets, reasonably leads to the formation of a variety of opinions, and so long as there is absent a clear perception of the underlying principles on which any leads to the formation of a variety of opinions, and so long as there is absent a clear perception of the underlying principles on which any leads to the formation of a variety of opinion, and the polymer of the underlying principles on which any prove even "exasperating" to those who are indisposed to discuss the matter in a calm and philosophic spirit. I feel disposed to dispute the justice of your criticisms in the issue of January 12, and also the fitness of the cubic contents rule to measure the allowance of this due to one yacht from another. I must deny the possibility of a size rule which valuing the differences in yachts, and express dimensions, judiciously which taxes freeboard and encourages reduction of bulk has only to be adopted without any limitations as to ballasting in order to encourage the production of the most ultra type of racing machines easily to be conceived of, in comparison to which a Lake Windermere boat would compare most favorably. How would you like, for instance, a boat with a Windermere misship section, attenuated by reduced beam, situated by a fin like the Evolution's containing all the hallast, or by a situated by a fin like the Evolution's containing all the hallast, or by a situated by a fin like the Evolution's containing all the hallast, or by a production from whose experience and authority in such matters and deservedly high. Such a rule has been frequently condemned by lixen from the most favorable, and authority in such mat

THE BYRON HOUNDS.—GASTON, N. C., Jan. 27.—Permit me to correct a typographical error which occurs in my communication on Byron hounds in your issue of Jan. 19, for the benefit of your several correspondents. Substitute "Byron" wherever "Byrson" is found. Brodwax's pack, as well as my own, consists exclusively of the Byron strain. I know of no such hounds as the "Byrson". The distemper is still playing havoc with my pack. Seven, apart from Fancy's and Fashion's litter of suckling pups, have died. Four others likely to follow.—T. G. T.

EASTERN FIELD TRIALS CLUB.—A special meeting of the Eastern Field Trials Club will be held at room 18, Tributs Building, to-day, Thursday, Feb. 2, at 4 P. M., for the purpose of receiving the report of Mr. Geo, T. Leach, Treasurer, and to transact other important business.

DOG WHISTLE.—The dog whistle invented by Mr. Chas. F. Kent, of Monticello, N. Y.. is a neat and serviceable little adjunct of the sportsman's field equipment. See advertisement eisewhere.

bodds after change tooks, am a B deshador to enforming their tree participation in the very few club races which take place after a proposed ready participation in the very few club races which have not the 18 of course impossible for me to say who have or who have not the 18 of course impossible for me to say who have or who have not the 18 of course impossible for marks seem, however, to be prompted by some inscenception of discussions in which I have recently taken a part.

I have not heard, excepting through your pages, that any one would propose set the same untraxed when placed at the same depth, but covered by a garboard. It seems when placed at the same depth, but covered by a garboard. It seems committee should fail to some should propose store in rule, or that any committee should fail to some should propose store in rule, or that any committee should fail to some should fail to be should fail to some s

esitemition for a simple measure of length, and this is not your proposition.

You say "her opportunities for speed!" "lie in her size,! "in her size, the of course include the keel in "her bulk," and a weighted keel has considerable of it. But I presume that you do not intend to he had so made to the season of the bulk of course made head of the season of the bulk of the season of the had bulk of course made them all allike, whereas every one knows that length, possed particular all allike, whereas every one knows that length, possed particular all allike, whereas every one knows that length, possed particular all allike, whereas every one knows that length, possed and had to these depth have different values for producing speed in salling vessels, and that of these depth is of least value, and to charge them as of equal value is certainly a pretty heavy tax on depth.

It is easily seen, too, that to raiso the deck a few inches for increase of free board, for room and dryness, it is a piece of costily extravation of the season of the board in the season of the board in the season of the board in the season of the seas

ind.

Do the opportunities for the Tarantella's speed lie in her bulk, or
ses the bulk of any other catamaran furnish her "opportunity for

does the bulk of any other catamaran furnish her "opportunity for Seed."

Than afraid that if the ardor for racing should increase, the very contrary of your proposition may prove more nearly true, that the length of the boat Joined to the largest attainable stability, and the smallest attainable sith surface, that can by any means be got with it, will give us the fastest boat.

You say, Mr. Editor, that the reasoning which takes power into consideration in a measurement rule is "beneath contempt."

This is a very hard judgment to pass upon your own rule, and upon the well considered rules of the English and some American clubs.

After such a statement it will be interesting to learn from you why, if power is not to be considered, anything but length can properly by put into a measurement rule.

Except as it gives power, what particular element of advantage is there in hult.

Is it in the breased extent of skin surface to experience friction—

Is it in the breased extent of skin surface to experience friction—

Is it in the breased extent of skin surface to experience friction—

Is a considered with virth which the waves of displacement and replacement are formed—the increase of area of midship section, or what

the greater rapinity with when the waves of displacement and replacement are formed—the hieroway of area of midship section, or what it is a set of the property of the proper

Such a charge is clearly arthrary and a uncermination, agains such boats.

In conclusion I may remark that any good rule now existing deals more or less effectively with power and length, and only with those. Any proposed rule must include them. This accomplished, the more of the control of

CUTTERS AT SEA.

CUTTERS AT SEA.

Editor Forest and Stream:

As the question of the day secus to be "Sloop vs. Cutter," perhaps a few words from one who held the tiller in many a close fight may no be out of place. During the lost few months, indeed, since the advent of the Madge in American waters, Diaverend so much twaddle about mere reacing machines," "no comfort," errew drenched to the skin," etc. setc., that I am formed to believe that most of these orticles were written by men who never recied a moinsoil or shifted jibs in their written by men who never recied a moinsoil or shifted jibs in their matter as "club-room cruisers." Examination the Swedies, are designated as "club-room cruisers." Examination that the cutter which is, and as to confort, speed and sengoing qualities. I can give a little actual experience in this type of vessel. The tirst cutter which I owned and salfed was a boat of the following dimensions: Length, 20ft, 6im, beam, 6ft, 6im, draft 6ft, 1im, lead on keel, 4 tons, flush clock, watersight cockpit and skylight, in fact, deck fillings about same as Mudge. First season started in twenty-three races, and at only on the start of the word. Now, as to confort, (always keeping before our sense of the word. Now, as to confort, (always keeping before our sense of the word. Now, as to confort, (always keeping before our mind the tomage of the boat) 6ft, 6im, headtoon in a cation with two iron-framed cots which closed up to the side when not in use; sail lockers aft; coal stove and lockers, with another cot forward of mast. Myself and two men lived on board all of one season and were not cramped at all. To show what a safe boat sign was, I crossed the Diaglab. Channel from Kingstown to Holyhead, to Liverpool, Islo of Acquisers and the start worth of note. This was the first five-tenner that avections and worthy of note. This was the first five-tenner that avec

Fen. 2, 1862.]

To calls to my mind a passage which we made from Liverpool to the Islee of Man with a received tryadil, double reded forestal, spid-fire jib. on the Mange of the Mange contests—"she was perfectly awash"—calls to my mind a passage which we made from Liverpool to the Islee of Man with a received tryadil, double reded forestal, spid-fire jib. on mistake, how to for 8 hours; we had it hot and heavy, and many a mine I wished myself out of the scrape. I am, however, of opinion that had an advocate of the sloop type been on board, he would have 'blessed his stars' he was in a tight little cutter. One of the best proof's I know as to the "racing reachine" superiority is the fact that in Eagland, when building crusing yachs for comfort and pleasure only, in place of the old-fashbonel short, beamy, hint-bowed outside, just as in any racer. Experience has taught them to do it. The entire type and model is the result of years of experience and experiments, and it may lorerest American yachtsmen to know that the first boat of Mr. G. L. Watson, designer of such ellippers as Vril, Madge, May, and Vandurar, awas a centreboard sloop named the Peg Woffington, and often, when passing her in a smaller cutter, have he and I cutyoe'd a hearity laugh at what he used to designate "in a jump of a sea than a cutter; with this opinion I beg entirely to fiften a smaller cutter, and the mange of a wave, losing her headway, flop down into the trough of the sea and chrow the water all over herself; the cutter, all the time headreaching, will take some water over the ler rail, but nothing to signify, as these deep boats with the bankstat low down recover very quickly. In sloop search of the control of a wave, losing her headway, flop down into the trough of the sea and chrow the water all over herself; the cutter, all the time headreaching, will take some water over the ler rail, but nothing to signify, as these deep boats with the bankstat low down recover very quickly. In sloop search and the sea and chrow the water at a hig

LARCHMONT YACHT CLUB.

Editor Forest and Stream;
The following is the text of the resolutions passed at the last meeting noticed in your columns;
No. 1. A motion was made by N. D. Lawton and seconded by F. N. Scott, that a committee of three be appointed by the Commodore to consider the question of measurement as a basis of calculating time allowance, and as to the advisability of any change being made in the present system of measurement in use in this club; and that such committee report to this club at the next regular meeting the result of their labors, and in case they deem any change advisable, that they recommend some system simple in its operation under which boats can be quickly, accurately, and satisfactorily measured, together with a table of time allowance for use under such system so recommended by them.
The motion was carried, and the Commodore appointed Messrs, N.

recommend some system simple in its operation under which beast can be quickly, accurately, and satisfactorly ineasured, together with a table of time allowance for use under such system so recommended. The motion was carried, and the Commodore appointed Messrs. N. D. Lawton, A. B. Alley and F. N. Scott, the committee.

No. 2. A motion was made by N. D. Lawton, seconded by Mr. Hague, that a committee of three be appointed by the Commodore to frame and submit to the club at the next regular meeting, a new set of sailing rules and regulations separate and distinct from the by-laws of the chib, which sailing rules and argulations mobby the sailing rules and regulations reported by the committee on the constitution and by-laws, with such adultions and afterations as shall be necessary to and which sailing rules and regulations reported by the committee on the constitution and by-laws, with such adultions and afterations as shall be necessary to and which sailing rules and regulations, and which sailing rules and regulations, and which sailing rules and regulations and the courses for this club.

That such committee shall also select and designate proper fixed courses for the respective classes of boats in the regatas and record and report the same at the next regular meeting of the club. That such rules, regulations and courses shall be printed in the club. That such rules, regulations and courses shall be printed in the club. This motion was carried, and the Commodore appointed Messrs. N. Lawton, A. B. Alley and Oliver Adams, the committee.

No. 3. A motion was made by N. D. Lawton, seconded by F. W. Flint, that a committee of three he appointed to frame rules and regulations for contests for champion pennants, to be held by each class of the boats enrolled in this club, and that when acted upon such rules regulations of the course of this club.

The motion was carried, and the Commodore appointed Messrs. N. S. A. motion was made by N. D. Lawton, seconded by F. W. Flint, that the committee on sailing rules and reg

A vote was taken, and the Commodore declared the motion lost. X.

It is very much to be regretted that the Larchmont Y. C. has found itself unable as yet to declare for fixed ballast in all its matches. We hope that in the future the interests of small cruising and cabin yealth will be sufficiently strongly represented in the club, to cope with the evil and to support the excellent resolution proposed by Mr. Lawton, It seems a pity that wholesome little boats with fixed ballast are to find no place on the list of so progressive a club. One such boat does more to encourage legitimate yachting than a feet of sand bag shifters, and we are sorry to find the latter carrying the day and by per mitting the shifting of weights, helping to postpone the introduction into New York waters of the cheap, safe, handy, little craft which ought to form a nursery for the sport to be especially encouraged in all clubs.

YACHT STOVES.

YACHT STOVES.

Editor Forest and Stream;
I am pleasantly surprised that your article on yacht stoves should create such inquiry from all over the country. My dosk is several inches deep with letters from your readers. Let me say to R. B. R. and others that my small tin Danforth stove, to which you referred, will not broil or bake, for those operations require a hotter fire than any other kind of cooking. It will, however, do everything else, besides glying light. All who can afford 14 inches quare of space and 14 inches of height, with a chance to place a fount somewhat higher, bake to early extent, a twenty pound turkey or roast beef, or eight loaves of bread at a time, or as little thereof as may be required. For enough and light use generally, the tin stove is all that is necessary, and the light may give more comfort than a "broil." For temporary use, as indicated, we can hardly expect everything. Providence was kind to R. B. R. With his oil stove, but the Danforth fluid stove will refleve him of sacit trouble and dauger. All dirt, soot, askes and kindling is avoided. Should fluid be spilled about the lamp, wipe it up before lighting. The plan of putting a stove in a box suggested by the plan of putting a stove in a box suggested by Roberts and the plan of putting a stove in a box suggested by Roberts and the plan of putting a stove in a box suggested by Roberts and the plan of putting a stove in a box suggested by Roberts R. Danforth.

CHALLENGE TO CUTTERS.

Editor Forest and Stream: In view of the fact that Madge thrashed two or three of our sloops last year, and, as some people think, that her success was due to great deplacement. Those propose to too this question practically, there loop setemifically, if any outtor freeds can be coaxed to too the

fore scientifically, it any other reggos can be coased to be the mark.

In order that the experiment may not be an expensive one to any rerson concerned, I suggest that it be made on a small scale—having the authority of Forest and Straman for the assertion that a principle can be proved in miniature as well as in any other way.

I therefore challenge any yacht builder or designer in this country to construct and rig a genuine cutter, which in size shall not exceed 80 cubic feet, and to sail her against a nonparell boat, of same bulk, which I will build. The dimensions of both craft to be obtained by measuring length over all, extreme beam, and depth of hull amidship, from level of plantshear to outside of garboard seam, and multiplying those together. No time allowance to be given. No ballast to be

shifted. No sail to be certical which cannot be fairly used to which ward. Only one man (for captain and all hands) to be allowed on either beat—ho being a non-professional—and the race, or races, to be sailed over the N. Y. Y. C. course, or on L. I. Sound. I should prefer the test not to be made for money, regarding the "almighty dollar" as an unnecessary incentive to Corinthian effort.

The above offer is made in a fair spirit and with an honest desire on my part to settle some matters of opinion which have not always been by the control of the control

WORKING BOATS.

WORKING BOATS.

Editor Forest and Stream;
It has often struck inc that the yachting columns of the Forest AND STREAM could do good service to persons other than those who go on the water merely for sport, by giving space for drafts of working locats; such as fishing smicks, oyster pungies, claim boats and craft of that kind. This idea has been very forcibly impressed upon my mind while rarebling about the wharves, by observations of the inartistic stream of the property of

OUR BOSTON LETTER.

OUR BOSTON LETTER.

Bilior Forest and Styram:

Indications point to a big season in Boston and Eastern waters. All
Indications point to a big season in Boston and Eastern waters.

Indications point to a big season in Boston and Eastern waters.

Indications point to a big season in Boston and Eastern waters.

Indications point to a big season in Boston and Eastern waters in the season was a cutter betwan and ore very plant at the state of the season was a season was three years in the state of the season was three years ago there were but three cutters in Boston—Kitten, Violet and Enterprise (Saxon, nee Kitten, has returned to her madden name)—there are now dozens, and they are all good, wholesome boats. The favorite size this year is from 30 to 35 feet over all, and the price for this size ranges from \$2,000 to \$2,500. A fricant of mine has just got estimates from one of our best builders for 4 tons lead on keel, to be build and insished in best manner, with full equipment. The price asked was \$2,500. As stated in your issue of Jan. 12, D. J. Lawlor is to build a cutter for Mr. Henmenway. He will probably lay down a boat on the same lines for Mr. George K. Boutelle. The model that these two boats are to be build not is said to be a perfect beauty, though I can say nothing from personal knowledge, as I have not yet seen if.

Southed the season is cause, the new club house. Marblehead will be some day the Cowes of America. Nothing said as yet as to any official changes in the various clubs. One or two of the clubs, however, appear to be getting somewhat "logy," and a little shaking up and verchauling would not hurt them. Or dit that yawl Edith will come out as a cutter this year, also that the change of Whitecap from schooner to yawl last autumn was not agreet success. Schooner Carrot of the season is the various clubs. One or two of the clubs, however, appear to be getting somewhat "logy," and a little shaking up and verchauling would not hurt them. Or dit that yawl Edith will come out as a cutter this year, als

TAXING FREEROARD

TAXING FREEBOARD.

Editor Forest and Stream:

I occasionally see the Forest And Stream here and am much interested in the discussion now going on in your pages as regards measurement. In your issue of Dec. 22 I see a statement in your edit total note to Irt. D. H. Rice's letter as follows: "Several small clubs total note to Irt. D. H. Rice's letter as follows: "Several small clubs can be a statement in your edit of the property of the same of the control of the property of the same of the control of the property of the same of the control of the control of the same of the sam

BOSTON TAKES THE LEAD.

BOSTON TAKES THE LEAD.

WHEN three years ago Forest AND STREAM first operaed war on the traps and began to fight for honest boats, little did we dream that a fin effect of atters would be honest boats, little did we dream that a fin effect of atters would be not beautiful to the proof. But the good cause has been nearly won, for not merely we we building a few experimental craft of the honest type, but a whole flect is to be affoat next season. Builders are crowded with orders for so many cutters that they have been obliged to turn customers for such craft from their doors, while a demand for the American cutter has already sprung up abroad. Boston, as usual in yachting matters, has taken a feedded lead. The craze for cutters seems to be on the increase. A Boston gentleman, with some experience in yachting, intends importing one from ham, with some experience in yachting, intends importing one from the same size he badage, but, it is claimed, is much faster—Bostom Herott.

A season of great activity among yachtsmen seems promised. There is not a yacht builder in Bostom who has not received one or more contracts for boats, and the yachting agencies report many sales. There is a demand for large schooner yachts which exceeds even the number of such boats for sale. The sir among the builders of cutters is most remarkable, and can partly be accounted for by the victories of the Madge. D. J. Lawler, of East Roston, had to refuse contact the properties of the builder in the cutters, and Lawley & Sons, of Sourt summer. D. J. Lawler has just shipped on the steamer Servia the will be 35 feet over all, 9 feet beam, 6 feet draft of water. She will have four tons of lead on her keel.—Boston Globe.

OVERSPARRING.

Editor Forest and Stream:

The shot you gave the proposition to limit length of light spars and to place a restriction upon light sails which has recently come up in the Atlantic, Y. C., is an eminently just bit of criticism. Such a rule will compel a man to put every inch possible in his lower sails, thus making a boat which is already none too good in type a perfect manrap and most expensive and difficult to handle in any but the mildest zephyrs, and smoothest water. Such a rule will also have the effect for it is an axion that the future success of a club is directly proportional to the amount of encouragement it offers to small yachts. Now small yacht owners are the real lowers of the sport who cannot afford, not so much to buy, but to run a large boat. So a floot of small yachts

cannot exist in a club whose measurement and sailing rules compel a man to have nothing but a "big little boat," necessitating an enormous rig, and that all put into lower sails, into the bargain.

JEWELL.—This sloop is now receiving a heavy lead keel at Stapleton, S. I., the intention being to set her up as one more victim for the Madge next season.

THE TIMES.—Kittania and Resetta, of Boston, are to shed their fins at Webber's yard and come out as keels. Sloop Jane is to have an iron keel of 5,300 pounds. That is the kind of business we like to see keel of 5,000 pounds.

to see.

KNICKERBOCKER CANOE CLUB.—Officers for the year: Commodore, H. T. Keyser; Vice-Commodore, Charles S. H. Buchanan; Scoretary, R. H. Wilkins; Treasurer, Adolph Loventhal, and Measurer, S. Loventhal.

tary, R. H. Wilkins; Treasurer, Adolph Loventhal, and Measurer, S. Loventhal.

Loventhal.

THE MODERN BOAT.—The Lawleys have completed a modern cat boat for Mr. Thomas flott, of Boston. Sho is 17tt. long, 14/gft. load line, 4th. beam and has 300 lbs. from on her keel.

SHADOW.—This sloop is not to be converted into a machine as reported. Her cabin trunk will remain standing, but she is to be put in thorough trim and receive a long topmast. That much the Madge has at least effected.

NEW RULES.—The Larchmont Y. C. has taken a copputential step in the proposed revision of its sailing rules. We understand that the blue book of Yacht Racink, Association will form the basis of the new set, which promises to be the most complete in America.

COST OF CUTTERS.—From our correspondence it will be seen that a competent builder offers to contract for entires 34 to 33tf, on deck for the sum of \$3.500, including lead on keel. Cheap enough, and the bugaboo of the great cost of such boats vanishes before facts.

BUSINESS OPPORTUNITY.—We call attention to an advertisement desiring a partner in a legitimate business capable of large extension and of remunerative character applicable to yachts and shipping in general. The business needs only to be put on the market to insure success.

YACHTING LAWS.—It will be remembered that the root of the insure

desiring a partner in a legitimate business capable of large extension and of remunerative character applicable to yachis and shipping in general. The business needs only to be put on the market to insure success.

YACHTING LAWS.—It will be remembered that through the instrumentality of the Seawanhaka Y. C. and its former efficient secretary, Mr. O. E. Crouwell, an extensively-circulated petition for the modification of existing laws relating to yachting was piaced in the hands of Congressman Townsend. This petition has now taken the form of a Congressman Townsend. This petition has now taken the form of a congressman Townsend. This petition has now taken the form of a discussion of the same appeared in FOREST AND STREAM, Vol. 14.

AT LAST.—We have often urged the necessity of bringing more refinement and knowledge to bear upon yacht building. We are signated to the construction of the same appeared in FOREST AND STREAM, Vol. 14.

AT LAST.—We have often urged the necessity of bringing more refinement and knowledge to bear upon yacht building. We are figured to the construction of the same appeared in FOREST AND STREAM, Vol. 14.

AT LAST—We have out calculations upon the hull so as to obviate alterations after once finished. The owners of Oriva, Muriel and a flew other yachts do not regret having delegated the task of designing altered to the same of th

Bifle and Trap Shooting.

OLD-TIME PISTOL SHOTS.

OLD-TIME PISTOL SHOTS.

Editor Forest and Stream:

As in your last issue you in rite correspondence that will give definite information on the subject of pistol shooting. I am induced to give my experience. It is a sport that has afforded me much interest and amusement for the past twenty-five years. Living in the South for the five years preceding the war, I had many opportunities not of seeing, but hearing of the worderful performances with a Coll's repeater or a Derringer—the favorite weapons of that day. I became ambitious to cut a tape, drive the centre, etc. Procuring a six-fine Coll, I commenced my practice with great zeel, and continued a six-fine Coll, I commenced my practice with great zeel, and continued years of the college of the col

PISTOL SCORES.

Each mail now brings to this office sample targets made with pistols, and some of them are capital ones. To be able to plant 10 consecutive shorts from a 32-calibre common S. &W. re-olvertal 5/cet, or 13 paces into the space of a postal card, or even half of has the shots were grouped, shows that the marksman was able to get all that record of our correspondent at Elk City, Pa.
Another correspondent at Elk City, Pa.
Another correspondent at a Louisville, ky, sends the following story of a piece of marksmanship, which he very discreetly says he "was told;

Another correspondent at Louisville, Ay, sends the following story of a piece of marismaniship, which he very discreetly says he "was told to January 2, at a turkey shooting at Bullitt's Grove in Jefferson county, eight miles from Louisville, Dr. Silas Wettherby killed nine turkeys at 120 yards, a record of four turkeys in 5 shots being made. An ordinary 5-shot, 5-then barrel, 32-cd. Smith & Wesson pistol was used, the pistol being fired with right hand, the barrel resting on the first finger of the left hand placed just in front of the eylinder.

When you consider that 120 yards at a turkey shooting will come nearer being 130 measured yards and the small size of the target, I think it must be considered remarkable shooting; but the doctor says he has frequently done as well and is confident he can repeat the performance almost any day. Have known performances by men who are who have had abundant practice, and by the use of arms of the finest description. In place of the short barreled and large callibe revolver, the long barreled single breech loading weapon is used, using a carridge with just sufficient powder to do the work in hand, not sufficient to break up the aim. For these scores we can vouch, as they were made in this city, in a gallery of repute, under the eye of an experienced rifleman, and without possibility of trickery or favoritism. When scores are claimed and records assected far in advance of these we naturally express some degree of doubt and feel inclined to place these big claims in the same category as the wondrous tales of superb marksmansh so often narrated of the Southwestern cowboy.

ALBANY, N. Y., Jan. 38.—The sixth and final competition in the three hundred yards Life Membership match, was shot at Rensselaerwyck yesterday afternoon. The weather was mil.1, light fair, and the wind nothing to speak of. The riflemen were in good form and commenced the scores promptly on time. Good scores were made by all the competitors, but the match was won for the third and last time by Captain Fitch with thirty-two out of the possible thirty-five. The deals of the match are as follows:

When the Fitch, Bo. M. Yards—Life Membership Match.

Golden Opinions

CONCERNING

FOREST AND STREAM.

Orange County, N. Y., Jan., 1882.

It is especially pleasing to see your determination to elevate field sports into manly and useful recreations, relieving the odium that has attached to such pastime. The high tone that characterizes your journal is most oppouraging, and when I see articles from it copied in the leading papers, I begin to think that the time is coming when hunting and fishing will no longer be considered fit for lazy men only, but the worn-out professional or business man will become better acquainted with nature; when dyspeptics shall get relief, and effeminate pleasure give way to that which is sound and invigorating.

ROCKLAND, Mc., Jan. 7, 1882.
Would sooner be without my wife's mother than Forest and Stream. I like your paper and admire your principles, and the next time I go to New York I mean to call on you.

H. B.

Wellington, Kansas, Jan. 18, 1882. Your splendid paper is doing a world of good all over the country; and I only wish I could send you a hundred subscribers from our town. It is sadly needed here G. P. T.

OSKATOOSA, Iowa, Jan. 15, 1882.
Since I have been a reader of your paper have been highly instructed and pleased with the matter contained therein. Especially die article in issue of Dec. 29, "The Ideal Sports man," please me. I heartily and unreservedly agree with the writer in his definition. I also feel that FOREST AND STREAM is the journal o the nature-loving, ideal sportsman. J. E. S.

Bristol, Pa., Jan. 10, 1882.

Busy men, who have only time for a glance at the markets and the summary of news in the morning paper, invariably give themselves plenty of time when they sit down to read the Forest and Streeman; and there is no doubt that the advertisements each week are about as well scanned as in any journal in the country. I want to thank "Piseco," and "Nessmuk," and Ober, and Van Dyke, for the knowledge gained through their pleasing communications from what we may term the four corners of the United States, and with them are a host of others whose writings are read with pleasure and profit. Herewith find enclosed my usual New Year's greeting of a club of subscribers, which is the only kind of club I shall ever chuck at you.

C. E. S.

LITTLE FALLS. N. Y., Oct. 31, 1831.

Last April, while thinking up a summer's fabing trip, it occurred to me that I might get some useful information in the Fonest And Firezam. So I subscribed for it. "I'll get if for six months," I said—"see who's gone and find out where to go. At the end of that time the fishing will close and after that I won't care for it." I herewith enclose you renewal of my subscription, for either my love of trout fishing has ceased to be supreme, or I have become better educated. Although our trout fishing has gone, I don't see much falling off in the fever. I look for Forest AND STREAM Thursdays as anxiously as last summer when it was brought to me in the woods by my guide, and I must candidly say it's too thorough a sportsman's magazine to be dropped.

FULTON, Ill., Jan. 1883 Your paper improves with every issue; the "Sportsman Tourist" and "Natural History" departments are worth many times the subscription price.

D. N. A.

CHICAGO, Jan. 1883.

Don't see how I can get along without the Forest and Stream.

O. K.

I read your paper with increasing interest at every issue, and consider it the best in the land. I should feel lost without it, especially as I can not get much time for actual outdoorsport with rod, dog and gun.

A. P. K.

SHERBROOKE, Canada, Jan. 1882.
For the past few months a select sporting club of three members has taken the Forest and Stream, and I doubt it any one other copy of your paper is read more throughly, or better appreciated. As one of the members I take upon myself the honor of presenting to you the compliments of the club, and their sincere thanks for the large amount of entertaining information with which the paper is filled.

CANADA.

Allow me also to say that I thoroughly enjoy your excellent paper; have renewed my subscription, and while some years ago I only bought it occasionally as a luxury, I now look upon it as a necessity as well as a comfort Your views upon yacht building are the same adopted (after experience) by the "conch" builders of our fishing boats.

FRIENDS IN NEED-FRIENDS INDEED

SOME of the telegraphic dispatches of the great Park Row fire of last week, included the Forest and Stream in the list of journals whose offices had been destroyed. As one of the results of that report we have been overwhelmed with letters of sympathy, encouragement, and offers of practical Among these letters was one from Mr. T. Sedgwick Steele, of Hartford, who, supposing that our files had been burned, proffered his own full set of the bound volumes.

If anything could show the regard in which the Forest

AND STREAM is held by its friends, these spontaneous manifestations of such practical sympathy have done so; and it is needless to say how gratifying this manifestation has been to the Editors. To each and all, who have thus proved friends in need and friends indeed, we extend our sincerest thanks.

THERE is need of an organized game-protective effort in Texas. We are pleased to see the right stand taken by the Texas Journal of Commerce, which in commenting on some correspondence which it reprints from our columns, says "We heartily sympathize with the cause of 'game protection' all over our broad land; but especially within the bounds of our own State. Of late years Texas Legislatures have been in the habit of doing something promotive of 'game protec-But further legislation is required and will undoubtedly be enacted to prevent a wholesale slaughtering of game. Texas was once the paradise of the hunter; but every year, of late, evidences the fact that game is growing scarcer, and unless we protect our game against wholesale destruction, and during the breeding periods, we shall soon be as povertystricken in this respect as are the old New England and Middle States. Popular sentiment is in favor of 'game pro-

THE HON. T. J. SOUTH, who died at Frankfort, Ky., Jan. 13, was well-known to sportsmen throughout the South and Southwest, and was a very highly respected gentleman in his social and public life. We understand that at the time of his death Mr. South was under engagement to travel for Mr. H. C. Squires, of this city, in behalf of the Greener

The Winter of 1881-82 has so far been favorable for the game birds, and in decided contrast to the fatal severity of last season.

THE SIGNS OF THE MOON.

MANY anglers take the moon into their calculations when forecasting the prospect of success in a proposed fishing excursion, while others ridicule the influence of its phases upon the appetites of fishes. Those who believe that its varying changes have an effect upon their chances cite instances to support their theories, while the scoffers content themselves with their skepticism, and having no proof to offer, simply jeer and reject evidence adduced by the other

It is not our intention to take sides in this controversy, if it can properly be called a controversy, when the argument is all on one side and the opposition confines itself to skeptical grins, but we will merely cite a few cases where the moon is alleged to have an influence upon fishes and their capture, and then leave the deductions to be drawn by our readers. On the coast of Cornwall the fishermen always wet a new net on the third day of the new moon with the incantation:

O, moon, see my new net, Now the first time it is wet; O, moon, grant my wish, And bring me alway plentie fish.

Now if the moon has no influence upon the fishes, why should these men have preserved this supplication for genera-tions? The men of Cornwall also know that the clubmoss is "good against all diseases of the eyes" if properly gathered at the right time of the moon, but that it loses its virtues if the secret is written. As public benefactors we waive all benefit in our own case and give the secret as we heard it from an old and consequently reliable man. On the third day of the moon, when the thin crescent is seen for the first time. show it the knife with which the moss is to be cut and say:

As Christ healed the issue of blood, Do thou cut what thou cuttest for good.

At sundown, after carefully washing your hands, the clubmoss is to be cut kneeling. It is to be carefully wrapped in a fine linen cloth and afterward boiled in some water taken from the nearest spring, and made into an ointment with the milk of a new cow. If it be asked what this has to do with fishing, we will merely call attention to the fact that this is a fisherman's legend, and what can a fisherman do without his eyes?

That angle worms come out of the ground in "the dark of the moon" is known to every boy who ever took a lantern on a dark summer night to prick up the big ones to make an eel-bob with. Mr. Darwin has neglected this fact in his book on the earth worm, an oversight which escaped the vigilance of our valued correspondent "S. C. C.," who in our last issue called attention to some other points which the great naturalist slighted. Undoubtedly the earth worm in his wisdom knows that "the dark of the moon" is the proper time to bob for eels, and that it is easier for the boy with the lantern to pick him up than to dig for him, hence he comes to the top of the ground that he may be useful to man at the proper When the moon is full, it is of course heavier than when only half full; and its pressure on our atmosphere, it is alleged by the believers in its influence, causes the earth worm to seek relief from the superincumbent pressure by going below to seek the seclusion which the subsoil grants. do his sisters, and his cousins and other relatives. Therefore, as fishing is best when bait is plenty, it follows, so say the moonists, that fishing is best at the dark of the moon.

That the weather influences the fishing is allowed by many who do not believe that the moon influences the weather. Just how it affects the weather is not agreed upon, even by believers, and this we must confess to be a weak point in their theory. Some say that when the moon's horns appear to point upward it is like a boat, and there will be no rain, a belief chronicled by George Eliot in "Adam Bede:" "It 'ud ha' been better luck if they had ha' buried him i' the fore-noon, when the rain was fallin'; there's no likelihood of a drop now. An' the moon lies like a boat there. That's a sure sign of fair weather." According to sailors, when the moon is in this position it denotes fair weather, for they say, "You might hang your hat upon it," Hunters render it, "You can hang your powder-horn on it," and differ as to whether it will be wet or dry, according to their localities. The Scotch proverb, expressing the same fancy, runs:

The honeymoon is on her back; Mend your shoes and sort your thack.

When a large star is near the moon the sailors say it will be stormy: "A big star is dogging the moon." Thus the moon gets credit for affecting the weather, and the weather is again credited with influencing the fishing.

If catfish lay on fat in the full of the moon and consume it as the moon wanes, the anti-moonists must admit that the moon does have an effect upon fish—unless they can prove March,

that the moon only gets full when the catfish are fat, by the process of endosmosis, or the absorption of fat by the moon's In the latter case this would fairly account for the catfish being poor after a full moon. Since the decrease in the number of whales, it may not be impossible that fair Luna fills her horns from the oleaginous Ichthyocatus diehardabusforanigger'sbreakfastabus, whereby she getteth material for light to enable the eel-bobber to distinguish the small eels from the angle-worms. The subject may be considered fairly debatable.

A LAY SERMON.

WHATEVER the sportsman's creed, it is profitable for him to consider diligently the thirteenth chapter of Corinthians, wherein the excellence of charity is so beautifully set forth; for no man more than he who goeth afield should cherish this virtue. He suffereth long and much, of travel, of extortionate baggage men, uncivil conductors, and miserable quarters, of unprofitable tramps, in storm and heat and cold, of short hours of sleep and early hours of waking—all this he should endure in kindness; and of whom more than of him should it be said that he envieth not, vaunteth not himself, is not puffed up?

Let him also have charity for all his brethren, though some of them exalt the muzzle-loader above the breech-loader, or hold that it is as fair to shoot one wary bird sitting as another, no worse to lure a bird than a beast as big as a horse with a feigning of its call, nor to shoot the cunningest of animals before hounds, than it is the most timid and silliest of them.

Let not him who esteems no fish but the salmon and the trout worthy the angler's skill, revile him who is content with the bass, the pike-perch and the pickerel; nor him who, when other fishing fails, can be happy with the perch and the sunfish in his creel, or at a pinch, the ignoble bullhead. The salmon is but for the few, and the trout swims not in every stream. Because thou art fortunate, shall there be no fishing for the less favored ones?

He shall rejoice not in iniquity, but in the truth, and as nearly as it is possible for a shooter or an angler to do so. When he giveth his account of hits, let not his memory fail concerning the misses-and in his fish stories, let him not boast of pounds when in truth there were only ounces. As he hopes to be believed, so he should believe all things. Certainly he should ever behave himself seemly for the honor of his craft, and be not easily provoked, for with loss of temper comes loss of judgment and unsteadiness of hand, and the firm control of these is the true secret of the sucessful shooter and angler. Verily, if one hath not charity, which is greater than faith and hope, he is not the man with whom one would enjoy most a day in the forest, or beside the stream, or beside the camp fire after the well-spent day.

Cheeky.—A California paper says that a squirrel, which was killed the other day while carrying away wheat from a warehouse on the San Joaquin River, "was found to have 1,803 grains of wheat stowed away in its mouth." That squirrel had a well developed cheek. So did the paper that told the story.

SAVE THE TREES.—The plea which a correspondent makes for the due preservation of forests is temperate and reasonable. It will find a ready response from a very wide circle of readers. The evil complained of is not limited to New England, The remedy lies chiefly in individual example and effort.

We conclude in this issue the report of the Michigan Sportsman's Association meeting. When each State in the Union can show such a society of gentlemen working for the same ends the much vexed questions of game protection will be much nearer a solution than they are to-day.

Among the Newspaper Files destroyed in the fire last week were two complete sets of the Spirit of the Times from 1830 to 1861. Mr. Isaac McLellan writes us that he fears that the manuscript volume of his poems was also destroyed. We trust that this fear may be unfounded.

THE LIGOWSKY CLAY PIGEON is growing in favor. We understand that the terms of the prize tournament have been altered. The particulars will be published in this journal at an early date.

SNIPE SHOOTING,-"Byrne" writes from Crockett's Bluff, Ark., that no country can surpass the prairie lands of that State for snipe shooting in the latter half of February and

THE AMERICA CUP.

Y our news columns it will be seen that the Challenge Cup won by the schooner America in 1851 from the British in a match around the Isle of Wight has again been placed in the custody of the New York Yacht Club. Not long ago, it will be remembered, the Club returned the cup to the only surviving donor, Mr. Geo. L. Schuyler, with the request that more specific rules be attached to the trophy for the guidance of the Club in the future. These regulations will be found in full on another page. Practically they are the same which have always governed challenges from abroad, though in one particular a modification has been made and in another greater explicity will prevent misunderstanding and doubtful proceeding. These changes, together with the new form in which the rest of the conditions have been drawn will meet in the main with the endorsement of all.

The first modification consists of a clause excluding yachts belonging to inland clubs not having their home port on the sea or a branch of the sea. Nothing invidious was intended in adding this clause, but Mr. Schuyler wished simply to give effect to the ideas governing the donors originally in offering the Cup for international competition. These were the furtherance of the construction of seaworthy yachts and the encouragement of sea sailing. The requirements of inland navigation are often so much less exigent than those of the sea, that the advent of some shell of a machine transported by rail or steamer to race us on a fair day in smooth water was a possibility against which it is only fair that provision should be made. To permit an extravaganza unfit for the usual purposes of yachting to compete for the trophy against bona fide vessels, would have placed honest yachts at a serious discount, and with the natural inclination on our part not to be beaten, our whole fleet might have suffered more or less from the insidious influences of a successful imported machine, thereby bringing about consequences diametrically opposed to the laudable aims of the donors.

American yachts as a class are unfortunately none too good as it is with repect to ability and seaworthiness in general, and any stimulant likely to aid in retrogression on our part should be checked in every way possible. The least creditable points in American yachts are their flimsy build, incomplete outfit and machine-like mould. For boats of an inferior order the people have weakness enough even now, and we are therefore glad to find Mr. Schuyler doing his share to encourage a better state of things in prominently declaring in favor of seaworthy yachts by limiting competition for the cup to clubs whose interests may be deemed as lying in the same direction. The clause in question debars no individual. Should any inland talent wish to gain fame by capturing the historic piece of British silverware, he may transfer himself to the coast, there whittle and build to his heart's content, and should be succeed in making a lucky bit, an eligible club will no doubt be found anxious enough to become the backer of the new wonder, take her under their wings and give the required six months notice.

As to the other clause now put into clear language admitting but one interpretation, we feel sure it is most welcome to fair-minded sportsmen and all gentlemen as well. allude to the paragraph definitely limiting competition to a single yacht on our part. The thoroughly illogical cry raised in some quarters that because the America sailed against a flest of ancient tubs a fraction of her size, with a couple of bluff bowed old schooners thrown in, all challengers should be met by the entire fleet of cracks the N. Y. Y. C. could muster, has, fortunately for our reputation as a fair-minded people, received its death blow. Hereafter the stranger will find himself opposed in a legitimate manner by a single yacht only, and the match will be decided upon its merits without any possibility of the sharp practice of some unscrupulous person or the lubberly steamship of a skipper interfering with the visiting craft while one of our own fleet is allowed to go over the course free from interference. The late practice of the club in this respect has by the new stipulations received the indorsement we always felt sure it would at the hands of the gentleman who again entrusts the Cup to its former custodians. "Jockeying" is debarred by his commendable decision on this vital point, and the views of FOREST AND STREAM have again prevailed.

The acceptability of the entire deed is, however, sadly marred by the introduction of an unwarranted privilege on our part. The right to select a competitor on the morning of the race, with the implied power of substituting a fresh representative for every one of a series of races, is a reservation, the equity of which may well be called into question by the foreign world, to whom the deed is really issued. It is demanding of the challenging yacht a far greater display of qualities for the capture of the Cup than need be posses by our own yachts for its retention, and for this inequable expectation the new deed of gift must seriously be taken to task. It is like holding back all the trumps out of the pack for our own special benefit. We insist that to win, a foreign yacht must not only be faster than our best light weather boat, but also faster than our best heavy weather boat: that he should be able to combine in a single vessel the qualities only to be found distributed among a number of our own. Though his boat may be superior to any one turnout we may be able to produce, he can achieve no results unless his single boat can be shown superior to all of ours collect-We regret that this view of the clause was not brought to Mr. Schuyler's notice, for he would hardly have insisted upon a reservation which is likely to keep

foreign yachts further away from our shores than hackle proves to be an irresistible enticement, for it is fust to ever, unless by private agreement a concession will the challenger as provided for in the be made to clause preceeding the one now referred to. But the mere existence of an inequable provision is likely to do much harm, for we cannot suppose the British yachtsmen will do other than to take us by our words officially expressed, and so unfair a proposition as matching a different yacht against a stranger, according to the weather, or even reserving the naming of the competitor until the weather of the day can be ascertained, will, as may be supposed, strike the foreigner as an attempt to overreach him at the outset. In some quarters this unlucky reservation will be interpreted as a fear on our part that we can no longer hold the Cup in open fight, and hence we resort to chicanery in the hopes of staving off the day of trial as long as possible. Those who know the temper of the N. Y. Y. C. are well aware that such an impression is perfectly unfounded, and that no yachtsmen stand more ready to give fair terms and no favors to both sides in a contest. It is all the more strange for that reason that a clause so repugnant to sportsmanship and so chilling to the ardor of those from whom a challenge might be expected, should have been allowed to appear in the revised edition of the deed of gift. The club cannot be held responsible for the actions of an individual, yet the whole subject was in reality "engineered" by the club from first to last, and we did hope that its indirect supervision would have been sufficient to prevent just such a faux pas as we now have to lament.

It is not at all likely that English yachtsmen will be rash enough to fall into a trap, however innocently it may have been set, so openly displayed. The power to match a different yacht for every race according to wind and weather, or the accidents that may befall our side, without according similar privileges to the foreigner, will strike him as most We are sorry to believe that less importance preposterous. than ever before will now be attached to the America Cup, and that its mere mention abroad is likely to produce a smile at the verdancy which permits us to challenge the world and at the same time openly retain the trumps in our hand.

There is but one supposition under which the challenger could obtain a really fair race. It is often difficult to foretell the weather of the afternoon by the looks of the morning sky, and thus we may be caught in the trap of our own device. We doubt whether a foreign owner would care to come three thousand miles upon such desperate chances. For the rest the rules will prove acceptable for all concerned, especially the measures taken to prevent successive challenges by the same yacht which lately threatened to become a nuisance, and which upon a former occasion caused much ill-feeling when a British yachtsman insisted upon representing a dozen or more clubs, and sailing that many matches with the avowed intention of claiming the Cup if won in a single one of the series of races.

The N. Y. Y. C. had the good sense not to demand, and Mr. Schuyler was clear-headed enough not to delegate the right to the custodians to refuse entertaining a challenge at their option. A stipulation of that nature would at once have robbed the trophy of all its value for international competition. Δ proposition of this sort was urged in some of our contemporaries, but the validity of the stand taken by Forest and Stream in this regard has likewise been borne out by the action taken.

The new 'deed of gift' has now gone forth to the world. It is a pity that in some respects wiser counsel did not prevail in its conception. In place of promoting international racing it will keep us safe from invasion until the ill-advised privileges bestowed upon ourselves are withdrawn, and even then it may take many years to efface the false impressions likely to be produced.

DOWN THE STREAM.

THOUSAND ripples played and chased each other in THOUSAND rippies played and the country the sunshine and sang their happy song, then ran swiftly between two large rocks, divided around one still larger, and quietly settled into a deep, dark pool a few rods below. Only settled for a little while, for this stream is like an impatient schoolboy longing for recess too anxiously to be very quiet, for at the next turn, circling in a blinding whirl, turbulent and unruly, it boiled and bubbled as though Neptune were preparing a wash-day dinner.

Around projecting points and overhanging ledges, gurgling in the grooves it has channeled in the rocks, every angle is a surprise and a revelation. Now it "singeth a quiet tune," and stealing in murmurs from you hillside, a crystal stream adds its mite to the rest and races with it between great mosscovered boulders, loiters with it through a succession of languid currents, and then belter-skelter, white-flecked with foam, they hurry on again.

Above is the blue sky, checkered here and there with light fleecy clouds, which look like plantom ships sailing over the distant hilltops, and the forest of evergreens elimbing up their sides, while all around us the birds with their joyous ripple of song are as prodigal of their notes as so many spendthrifts.

Drop your flies in yonder pool. "It is not as deep as a well nor as wide as a church door," but it has jewels resplendent, jewels that may be had for the careful seeking-and careful it must be, else they will never rise to your deceits. Well placed. Now draw them diagonally across it, close up to the end of that log.

A swell in the water, a rainbow flash, and that brown

the mouster. There is material on the end of that line for a first-class skirmish. Whew! a skirmish, is it? It looks as though it were going to be a regular pitched battle. comes like a shaft of light, and away he goes with the impetuosity of an Indian after a scalp. Two minutes later and the battle is over. A slackening of your line and the fish has gone. How did he do it? I don't know. him on the instant of sight, played him as skillfully as you struck him, judging with nicety the strain your rod was bearing, the resonant reel paying out line to meet the demand upon its resources and receiving it again with a quick turn when the rush came the other way. Yet he escaped, and a search-warrant will not produce him again this day.

Losing a well-played trout through no fault of your own rises to the dignity of a calamity; but never mind.

"I know we have within our realm Five hundred good as he.

There are no doubt extenuating circumstances; and that trout knows what they are; but as he will never tell, we must let the loss pass into the category of unsolvable problems, and wade along as we must do to fish this stream right, more slippery rocks one meets increasing his chances for an involuntary bath, the more windfalls he encounters augmenting the probabilities of having his clothes torn off him, the more deep pools for him to step in, only add to the attractions of a mountain stream. This is the charm. It overlaps the three drops of constitution water as it comes tickling the soles of your feet and curling around your legs, as you brace yourself in the middle of an eddy to make a cast into a trout hole thirty feet away; and if you get up to your neek unexpectedly, it's little alarm you need feel, for up at the shanty you have a complete change of clothing hanging on a couple of pegs and perhaps a "wee drop" of medicinal whisky, which on such occasions comes in just right.

Little consolation does the stream offer for lost fish or wet jackets, as it runs along darting here and there under the banks and then out against a huge rock that stubbornly holds its place, despite the full rush of the water, which grows white as it settles back against itself and then like a sensible stream gives up the idea of butting that rock and goes around it, taking a breathing spell in the long stretch of quiet between the alders. A good rest it proves, for again it awakens and rushes in a whiripool of disorder on its downward course.

Let him, who would not jump out of the feather bed of civilization and go with us down the stream, stay at home and hobble like a gouty grandfather twenty-five years before his time. But you, good partner, come along and bring your rod with you. If coming on such a trip is a weakness, a laudable one; and you will find the experience exhibitanting and health giving. MILLARD.

BYE-WAYS OF THE NORTHWEST.

TWELFTH PAPER.

TWELVE miles from Walla Walla is the new almost described town of Wallula, and from this point a branch of the N. P. R. R. takes us south to Ainsworth on Snake River. It is a hopeless, straggling little town of a dozen or twenty houses, set in the midst of a dreary sage brush plain, unutterably monotonous and uninteresting. All day and all night the wind blows a steady, persistent force, carrying with it the sand of the plain, which it piles up here and there in great dunes, which are constantly shifting and being borne backward and forward as restless and inconstant as the sands of the seashore. Often it is piled up so high as to cover the sparse vegetation. Here we were only obliged, fortunately, to spend one day, and the next morning we left for Spokan Falls, carrying with us only our blankets and bags, since, as we proposed to cross the Range by a trail practicable only for packs, all heavy baggage must be left behind. For 59 miles beyond South Ainsworth the road follows up a wide coulie, and then passing the Summit enters another, which it follows until the timber is approached. Until the Summit is reached there is nothing especially attractive about the country. No streams or lakes are seen along the line of the road, and all water must be obtained from wells. Rook from the track, however, there is plenty of water. All this section will, in my opinion, ultimately be a great grazing country. The feed is of excellent quality and grows thick and rank, much more so than in most of the celebrated cattle ranges east of the mountains. The prairie is rolling, with occasional walls and piles of disintegrated granite winters are usually very mild, and we were told that snow rarely remained on the ground longer than twenty-four hours. Some distance beyond Summit we pass Big Lake, and here we enter a territory about the excellence of which as a farming district there can be no question. The country is well watered, the grass thick and high, and the many farms have an air of prosperity very pleasant to behold. The extensive hay fields were dotted with stacks and the barns and outbuildings were substantial and well kept; in the fields were herds of horses and cattle, all of them fat and in good condition. Big Lake is 9 miles long and from one-half to a mile wide. We saw thousands of geese, ducks, coots and grebes swimming on its surface, and among the latter recognized Podiceps occidentalis; gulls, probably L. delawarensis, were abundant. Soon after passing Big Lake the timber comes into view, and adds much to the picturesqueness of the landscape. We pass a number of beautiful little lakes surrounded by pine timber, and often enclosed by steep

rounded, and are everywhere dotted with clumps of evergreens. The most important towns on the road are Sprague, Cheney and Spokan, and these are the principal shipping points from the farms lying back from the railroad. region is a fertile one, the inhabitants industrious and thriving, and the day is not far distant when emigrants will see the advantages of this section and flock into it in great I know of no part of the West that seems to offer greater inducements to farmers than this part of Washington Territory.

We reached Spokan at 6:30 P. M. and found it thronged with country people, court being in session-so that we had great difficulty in securing rooms. The Falls of the Spokan River are very beautiful. The stream is divided into four branches by three islands of basalt, and the effect produced by the water falling over the different steps of the rock is really lovely. The rock weathers most easily on top, and the water thus makes the descent in a series of smooth, but sharply inclined riffles. The last fall is below the islands, and therefore carries all the water of the river, and is very beautiful. It consists of two steps, the upper one smoothly sloping and the lower a narrow channel through which the water plunges in a mass of white foam, throwing jets of spray high into the air and sending up clouds of white mist.

The town site of Spokan is a beautiful one, and there are many pretty houses there. The soil is a fine grayel, which, however, is said to produce excellent crops.

With letters from one of the officials of the railroad, we left Spokan before light next morning for Lake Peud d'Oreille. Thirty-five miles of railroad travel brought us to Westwood, the end of the track, and there we took stage for the lake. The ride was long and dusty, yet was not without many features of interest. At Dry Lake there is a remarkable trestle being built, which consists of no less than 182 bents. Just beyond this point was one of the enormous railroad camps which always precede the iron of a new road, It was a veritable canvas city, and its inhabitants white men, Chinamen, horses, mules and dogs. Everything here is on The eating tents cover an area equal to an enormous scale. that of a large hotel, the sleeping tents are numbered by hundreds; there are great forges, and watering troughs at which twenty-five horses could drink at one time; the bread pan in the cook tent was large enough to serve a full grown man for a bath tub.

As we approached the lake, the road became more and We passed frequent railroad camps; first the carpenters and bridge-builders, next the graders and then the "right of way men," whose business it is to chop their way through the forest, and clear off all the timber along the line of the track, for a width of fifty feet. Having felled it they leave it to dry, when it is fired. Too often the fire spreads, and large tracts of country are burned over and much valuable timber destroyed. This is, of course, the fault of the contractor, and there should certainly be some steps taken toward putting a stop to such a wanton destruction of valuable timber. As we approached the lake the woods were on fire everywhere. This had been going on for some time, and on several occasions, recently, the fires had been so extensive that the stages had been obliged, to abandon all hope of getting through. We were not stopped by the fire, although on several occasions we were obliged to drive between great piles of blazing logs, which made it unpleasantly warm for us, I noticed here much hackmatack timber, some of it of great size, and white and yellow birch are also found, the latter in small quantities. At the end of the stage route is the beautiful Lake Pend d'Oreille, surrounded on all sides by the towering hills, a lovely sheet of water. Here at the engineer camp we found two friends whom we had known years ago in the East, and little expected to find in this far off spot. The meeting was to us a most delightful one, and we shall not soon forget the cordiality of their welcome nor the heartiness of their hospitality.

Fifteen miles down the Pend d'Oreille River, or as it is sometimes called, Clark's Fork of the Columbia, is Siniaqueateen. Here is the Northern Pacific Commissary depot for the supply of the engineer parties which are laying out the line of the road over the Cour D'Alene mountains. It is a small settlement consisting only of a trading store, trader's house, and two or three storehouses and offices belonging to the railroad. I had a letter to Mr. Galbraith, the Commissioner of the company, who kindly promised to provide us with the necessary outfit for our journey over the mountains.

Siniaqurateen is in the Kallispelm language, "the place where we cross," and from time immemorial has been the crossing place for the Indians traveling north and south through this country. The trail to Kootanay, distant over two hundred miles, passes here.

We saw many Kallispelm Indians about the ferry. tribe, erroneously called Flatheads, hunt all through this region. They are well to do, and own many horses. It is in July and August that they are most numerous about the lake, when they come down to its shores as the waters fall to dig the camas (Kamassia esculenta), which forms a considerable portion of their vegetable food. As soon as the waters have fallen so as to expose the extensive meadows about the lake's shore, the camas springs up, and the Indians prepare to gather it. The root, which is a small bulb shaped like a tulip, is dug by the squaws in great quantities, and is prepared for eating in the following way: A pit is dug in the ground and

spread; then a large quantity of the roots, from 40 to 60 bushels, are emptied into it, covered with grass, and this with other hot stones. Earth is placed on this, and the pit is left undisturbed for three or four days. When opened, the roots have turned dark brown in color and are ready for use. They taste somewhat like a very sweet chestnut, and bread made of the pressed bulbs is excellent eating. There is much saccharine matter in the juice of this plant, and the steam from the cooked tubers, condensing on the stones when the oven is opened, forms a sweet syrup which is eagerly eaten by the small Indian children.

Another root used for making bread by the Kootanays is called by them kause. I have not been able to identify it, but think that it may be the root of a species of wild sunflower. It has a sweet aromatic flavor, and when dried and pounded to powder makes a most excellent bread. All these Indians dry berries for winter use, and the "sawice berry, which grows very abundantly all through the mountairs here, forms a large proportion of their food of this description. On some islands in Lake Pend d'Oreille I found sev eral small log-houses filled with reed sacks, each of which contained a bushel of dried berries.

On leaving the Siniaqueateen for the lake, the river gradually becomes more and more wide, and the scenery is very attractive. The valley of the stream is broad, and smooth grassy meadows, dotted here and there with willows, and other small trees, slope gently down to the water's edge. shrubbery and small timber is rounded and gives a park-like aspect to the landscape. Farther back there is growth of pine timber, and beyond the mountains rise, sparsely wooded nearly to their rounded bald summits.

On our way from "The Crossing" to the lake we saw a number of Indians in their canoes. These are curious structures, made of the bark of the white pine, and sharply pointed at both ends. The outside of the bark is on the inside of the cance. The Pend d'Oreilles, or Kallispelms, take the bark from the trees in very large sheets, and make rolls of it which they stow away. When it is needed for use they steep it in water until it becomes soft and easy to handle. A frame is made of small poles lashed together with strips of cedar bark, and this frame is covered with the sheets of pine bark, which are sewed together with tamarack roots and pitched with resin from the fir tree. The canoes are closed above from each end for some distance, and the Indians paddle on both sides. As might be imagined, these canoes are extremely cranky and upset very easily, for they are really almost cylindrical in shape, and there is nothing to keep them steady. Sails are not used, and the Indians creep along close to the shore, scarcely crossing from point to point.

Our journey from Siniaqueateen to the camp on the lake was made in one of the company's boats, and with a free wind. The next day, parting regetfully from our friends, we crossed the lake and reac- the N. P. R. R. camp at the mouth of Clark's Fork. A cay or two was spent here in getting the animals shod, the saddles together and our mess outfit ready, and then one bright morning a little train of even animals-filed out of the camp and took the trail for Missoula. Two packs carried our baggage and provisions, and these were in charge of a couple of men, one of whom was also our cook.

The journey to Missoula occupied about seven days. The trail follows up Clark's Fork, which is crossed but once near the mouth of the Jocks. From here a wagon road follows up the valley of that stream for a considerable distance, and then turns off to Missoula Mills. Nothing of special interest occurred on the trip. We traveled fast, not stopping to hunt or fish, though game and trout were abundant. saw a few deer and plenty of bear sign, but this was not a hunting excursion. We were trying to make time. Much of the country through which we passed is of great value, The timber of these mountains is very fine, and from these forests the Northern Pacific Railroad will ultimately derive great revenues. Along Clark's Fork there is much fine farming land, and the crops grown at the only ranch we passed on Horse Plains were a sight to see. Then, too, this is a grand horse and cattle country. The snows of winter are not deep nor do they lie on the ground for any length of time. Cattle require no shelter in winter, nor is it necessary, except in seasons of exceptional severity, which only occur at long intervals, to cut any hay for them. With the completion of the railroad this country will fill up with settlers even more rapidly than did that along the line of the Union Pacific.

From Missoula, two days' staging carried us to Melrose, then the terminus of the Utah and Northern Railroad, and from here six days of continuous travel by rail brought us to New York.

The completion of the Northern Pacific Railroad will be of incalculable benefit to the country at large by opening up to settlement an enormous area of most valuable farming, timber and mineral land to settlement and improvement. The wealth of Montana and Idaho have never yet been appreciated, but I venture to predict that with the advance of the railroad there will be such a rush of settlers to this country as is not now deemed possible. I believe Montana to be the richest of our Territories, and look for great things when she shall be accessible throughout her entire breadth by That time is, if we may judge from current events, not rail. far distant. The Northern Pacific is being pushed forward both from the east and from the west with great energy, and last Friday night, February 3, aged about 68 years,

walls of basalt. The hills now become higher and more the bottom lined with hot stones over which the grass is two or three years will bring the two ends of the road to

And here the note book is closed, and the chart is laid away in the portfolio with many another, on each of which is plotted a trail. Yo is about to lay aside his pen, and to hold his peace for another year. He has written many a column 'our paper," and his signature is not unfamiliar to it? older readers, who have journeyed with him for many a day over the plains, through the mountains and along the seacoast, and have been present with him on many a glorious hunt. To-night he sits alone in his room. The labors of the day are over and his last letter for the year is drawing to its close. As he casts his eyes about him the objects which meet his gaze cause him to give a lingering retrospective glance over the many happy days spent in his well loved West.

How well does he recall that warm September afternoon when he slew on the Upper Missouri the grand bull elk whose mounted head now looks gravely down upon him. horn skull with its enormous curving horns is a reminder of The superbly regular the Mauraise Terres of Montana. antlers of the white-tail deer's head call to mind the Dry Lakes of Nebraska, and the careful hunting that at last, after many efforts, brought down the great gray buck of the Dismal range. Graceful autelope heads with shining black horns, stare at him as he writes and tell tales of the sage plains of the Rocky Mountains, the deserts of Dakota and the parks of Colorado A beautiful mule deer with its velvety horns speaks of Crazy Woman's Mountains, and the grizzly bear's skin at his feet of the Freeze-out range. Half a dozen rifles and shot guns, well tried weapons all of them, stand in the corners of the room or lean against the bookcases. Elk horns hold cartridge belts with sheath-knives, salmon spears from the Northwest coast, hair rigtas from Southern California, and broad-brimmed, battered felt hats, once white, but now grav with the soil of travel. On the walls hang bows and arrows from many an Indian tribe, pipes of Sioux, Pawnee, Ute, Mandan, Rec. and Gros Ventre manufacture, moccasins made by the Snakes, buckskin leggings beaded by the Senoritas of New Mexico, rattles and masks from Alaska, tobacco pouches from southern Wyoming, Indian hat from Queen Charlotte's Sound, a couple of Cheyenne scalps from Powder River. All around the room are cases filled with stuffed birds, and each specimen brings with it a reminiscence of the days that are gone.

I like to look back-the memories of my journeyings are now all pleasant ones, though at the time the work was often hard and dangerous, and I many an hour wished myself well back in the East. But now that it is all over, I feel that I should like to pass through those experiences again.

My trip for next year is already planned. If it is made as now intended, it will be through a country little known, and which is said to abound in game. Perhaps when I return I shall tell the readers of Forest and Stream about it.

OUR RIFLE TOURNAMENT .- In order to give the off-hand shooters an opportunity to test their skill, we have arranged for a series of matches between the several clubs of the city and vicinity. There should be a lively competition, and with a dozen club teams in the field, there is no reason why the excellent average which the last tournament showed should The occasion will be one for those who adnot be beaten. vocate the real off-hand position without the hip or body rest to bring it into fair trial with the advocates of the hugging position. In our next and subsequent issues we shall give all information concerning the match, and in the meantime it would be well for the teams to make up their lists of names and secure early entries.

SHOOTING TURKEYS OVER POINTS .- Mr. Edward Odell, of New Orleans, writes us that while out shooting January 22, his pointer bitch Queen (formerly Munson's) drew to one of her magnificent points. As Mr. Odell had been shooting a good deal, he handed the gun to his companion, and just after doing so he saw on the ground, not twenty feet off, a fine large gobbler. Mr. Odell called to his companion to shoot, and he did so, but the gobbler made his escape. This reminds us of some experience of our own, years ago in Iowa, where we have frequently shot turkeys over points. It takes some time to get the birds to lie, but after following them for a while they will usually do so.

PROPOS OF THE PARK ROW FIRE-some brilliant genius writes to the daily papers that archers should be on hand in such emergencies to shoot a string into the upper windows of the burning building, that the occupants may thereby pull up ropes with which to lower themselves to the ground. There are only two trivial objections to this scheme. One is, that the skillful archers would never be on hand; and the other, that there is not one archer on Manhattan Island who could shoot an arrow into a window in the upper story of a burning building.

THANKS.-Complimentary notices are showered in upon us from every point of the compass. We quote elsewhere some of these commendatory expressions. For all these kind words the Forest and Stream begs to express its acknowledgments.

John Cornelius, well known to scores of sportsmen the proprietor of the Sawkill House, at Milford, Penn., died

THE NEW YORK DOG SHOW .- The sixth annual bench show of the Westminster Kennel Club will be held April 18, 19, 20, and 21, at the American Institute Fair building, Sixtythird street and Third avenue. Mr. Charles Lincoln, who will superintend, has arrived in this city and may be found at his office, No. 23 Park Row. It is the intention of the managers to make this show the best that has ever been held in this country. The prizes will be liberal, and among them will be found very handsome ones for the field trial winners. New classes will be added and no effort will be spared by the club to make this the most successful show that they have ever given.

"BYRNE" tells us that he has had many letters of inquiry about the Arkansas country from which he writes. These letters are so numerous that he cannot answer them individually, but will write something on the subject for our columns. The inquiries have been regarding climate, land, etc. "Byrne" has communicated some valuable information on these points to the *Prairie Furmer* and the *Farmer's* Review, both of Chicago, Ill.

EASY READING LESSONS-II.

FOR THE LITTLE READERS OF THE FOREST AND STREAM,

S this the Atlantic Ocean? No, it is not the Atlantic Ocean. Is this the Atlantic Ocean? No, it is not the Atlantic Ocean. It is the Tempestuous Sea of Journalism. What is that Funny Thing there in the Raging Main, three points aft the Port Beam? Is it a Spout? Yes, it is a Spout. What makes it Spout? The Editor is Blowing about his Paper. Oh, no, the Water Spout is not a Gas House. What is the Water Spout? The Water Spout is an Incomprehensible Phenomenon of Nature. Can we See the Spout now? No, we cannot See the Spout. Can we See the Spout now? No, we cannot See the Spout Where is the Spout?

"WOODMAN, SPARE THAT TREE!"

THE lover of nature, nowadays, cannot wander far afield without being shocked and enraged at 'the ruthless and indiscriminate destruction of forest trees; and with many cruel instances of this vaudal work staring me in the face in my walks and drives, I cannot forbear writing a protest against it. To be sure, it may be a feeble one and of no avail, but, as a sportsman and wood-lover, to be wholly silent is to shirk a duty and to be consumed with indignation!

nation:

In many parts of New England, as soon as harvest is over there is a rush to the axes and thence to the woodlands, and the foul work begins and continues almost until seed-

In many parts of New England, as soon as harvest is over there is a rush to the axes and thence to the woodlands, and the foul work begins and continues almost until seedtime.

I admit that there must be fuel provided, but this may be in plenty by a judicious "thinning" out of trees and branches. This, however, is never thought of, and acres of goodly growth are felled every winter that should be left upright. Much has been written on the influence of forests on climate, and much remains to be written—the subject is by no means exhausted. I wonder if the average New England farmer will ever have an eye to beauty? At present the most sordid utility reigns supreme without and within doors, and, with few exceptions, drudgery and spoliation is the rule at every farm-stead.

This ought not so to be! Surrounded as the country-man is by beauty and grace—the elements teaming with loveliness, and all about him fraught with softening influences, it is passing strange that so many men (and some women) see more to admire in a pig, or a potatoe, than in a flower, a tree or a sunset! Every farmer ought to be a conservative sportsman, lover of nature, and a rigid gamekeeper, at any rate, on his own estate. He should take a pride in affording and preserving suitable "covers" for game, and in exterminating the enemies thereof, including, of course, all "pot-hunters" and poaching trespassers. But I am digressing from my subject, and in recurring to it, I will suggest that every fisher and shooter, every fox-hunter and harrier is, more or less, interested and affected by this felling of forests or stripping the hill-sides, till they are as naked as a Fiji islander!

Whether game ablides or ablides not in the woodlands, the existence of a goodly growth of trees has a mighty influence on the surrounding country, and thus every bird and beast—yes, and fish also!—is directly or indirectly affected by the preservation or removal of a wood.

The present tendency is to make the whole country side an unbroken, universal stubble-field, an

sportsmen, this present year to go the a needed change in the game-haws and by their proper enforcement everywhere.

"Too late!" is a sad legend to be written over any place, or thing, and so is "Ichabod;" but if some very decisive movement is not soon made for the preservation of both forests and game they must be written in and on many a section of country.

Then the gun and dog and the rod and creel must be laid aside as a past memorial of past joys, or be painfully carried into some new and untried field and water—if, indeed, there remain any in this gain-greedy world.

Spare the trees! Spare the game and fish, and preserve [calously all. Then, with thankful hearts, enjoy the honest pursuit of fur, fin and feather, tempering every act with mercy, remembering that "Sweet mercy is nobility's true badge," and without which the panoply of the true sportsman is incomplete.

Will not some one make a move for a live Forest and Game Preservation Society, whose influence shall be felt and feared like the ghost of Hamlet's father, "hic et ubique?"

The Sportsman Tourist.

FOREST AND STREAM.

WIDE and far the woods extend, Leaf-laden branches graceful bend; The old oaks, like great tents, outspread Their verdant canopies o'erhead; The fir, the hemlock and the pine Their interlacing shoots entwine; The cypress of the swampy glade Enweaves a dark, impervious shade; The slender willows stoop to lave Their tassels in the rushing wave; The chestnuts cast their treasures down, Their opening burrs, their nuts of brown; And thick the clusters of the grape With purple wealth the alders drape. And on the Forest kings unfold Their draperies of green and gold.

Each river, each transparent Stream, Amid the woodland vistas gleam; They toss with foam where rocks impede The arrowy swiftness of their speed; They glide with smooth, unruffled sweep Where flow their currents dusk and deep, And fathomless abysses hide The sand and shells that pave the tide

Now deep in forest glooms the deer Bound in exultant, swift career; They leave the covert of the glade When earliest rosy dawns invade; They pause to nibble the sweet grass, In bosky dale, in mountain pass; They stop to drink the sparkling fount That trickles from the rosy mount. That treates from the rosy mount, Or lie at nontide to repose Where tall the fern luxuriant grows; But when the yelpings of the hound Athwart the sleeping shades resound, And when the hunter's whooping cheer And winding horn rise near and clear. Quick from their sheltering haunts they spring, And fly like fleet birds on the wing.

Forest and Stream ! I love to trace Your inmost depths, your watery race; I love your dense, primeval shade, O, forest monarch! to invade. I love, O, grand, majestic Stream! To wander where your ripples gleam, To plunge beneath your ice-cold breast;
To seek the wild fowl that infest
Your wooded shores; to spread the sail
In gusty breeze or howling gale; To take the springing trout that skim To take the springing front that skim Your face, or in abysess swim; In storm, in calm, in shade, in shine, My heart, my steps to thee incline. No haunts of earth so fair I deem, As Forest-side and banks of Stream!

Greenport, L. I. ISAAC MCLELÎAN.

REMINISCENCES OF LIFE IN CAMP.

Sweet memory! wafted by thy gentle gale, Oft up the stream of time I turn my sail To view the fairy haunts of long lost hours, Blest with far greener shades, far fairer flowers.

Sweet memory; watteen by targ genate gaue,
Oft up the stream of time I turn my sail
To view the fairy haunts of long lost hours,
Blest with far greener shades, far fairer flowers.

MANY years ago, when the writer was much younger than
he now is, before "his face was furrowed o'er with years,
or hoary was his hair," it was an invariable custom among
those fond of the gun in this section of country to have two
"hig hunts" each year, in the broken sand hills which lie
between the Cape Fear and the Pec Dec. The locality to
which I allude was the region on the head waters of the
Little Pec Dec, or Green Swamp, as it is called in the neighborhood, and which are situated not many miles east of
Lumber River. The section is traversed with quite a number of clear streams, and nearly all of them have an undefined margin, but course shnously through swamps of gum,
bay, maple and other woods which love a wet and spongy
soil. In these dense swamps, during the autumn, deer were
found in abundance, but chiefly does and yearlings. The
blackjack thickets, which were common on the sidges, were
the favorite haunts of bucks.

Our months were September and October. We had one
tent, and the "accompanying documents," so to speak, and at
the usual time, putting our heavier luggage on a wagon, and
ourselves in buggies, we drove out to the camping place,
near the head of the Juniper, spread our canvas, built a roaring fire of blackjack logs and lightwood knots, and after
discussing the plans of operation for the following day,
dropped down on our pallets and sought the necessary
repose. It often happened that we took a preliminary lumt
on the way, so as to secure a supply of venison for use at the
camp. And we rarely failed to get it. I recollect my first
experience in hunting deer. It was in October, and when
frost first made its appearance. I was armed with a 15-bore
muzzle-loader, and had carried out another gun of about the
same size to lend to a local huntsman, whose only weapon
was the old-time flint and steel musket. In th

and then coming out, this one headed at once for dry land and dashed towards the rear, passing within easy range of the rear guardsman—who had the little gun referred to—and equally long range of the writer.

Squire Jim, being nearer and having had much experience, was waited upon to deliver the first broadside, but he failed to shoot; and as the deer passed within about thirty yards, I let go the left barrel, expecting to see it tumble at the pop. To my astonishment, it did not even failer, and after looking at its flight for fifty or sixty yards, I recollected that I had another barrel, which, without much deliberation, I cocked and discharged. But as far as I could see I had made no impression, and the fleet animal soon went out of sight, followed by the faithful dog, who was in full cry. In less than a minute the dog was quiet, and Squire Jim remarked to me that I had killed it, or the dog would have returned—for such dogs never pursue a fleeing deer more than a half mile, and if they do not find it, come back at once to the swamp. I asked why he did not shoot. His reply was that he had tried, but could not get the gun to fire. I found that he had lifted the hammer until he heard one click, and as it was but at half-cock, he failed to get the deer, which it was now my good fortune to claim. I stated to him that the deer was a very large doe. "Doe, indeed," said he, "it was a large buck." "Why, I didn't see any horns," "But I did," he replied, "and when we get to him, you will see that he is a five or six pointer." Sure enough, when we had walked about two hundred yards we found a fine buck stretched upon the earth, and old Ring was feasting upon the flowing blood. But one shot had struck. That hit in the flank, and came out at the neck, in the opposite side. The second barrehad done the work. And did I not feel proud? Successful sport has produced no such joy since. There was a mild suggestion that I be wrapped up in the hide, as the penalty, or rather price of my first honors—but some tender-hearted friend

sport has produced no such joy since. Incre was a mind suggestion that I be wrapped up in the hide, as the penalty, or rather price of my first honors—but some tender-hearted friend obtained mercy from the court, and I escaped the fearful judgment.

Our hunt lasted three days, and resulted in fifteen deer. It was rarely the case in those days that we got less than six. It was laborious work—for we all walked, and as our course was on hill-side covered with pine leaves, one often slipped, and this made locomotion extremely tiresome. But when we reached camp at night, and partook of a plain but hearty meal, in which venison steak was an important factor, it required no downy couch nor music's strain to invite us to soft and sweet repose.

As a general thing, we were met by some gentlemen from the southeastern part of the county—the McL's brothers, all of whom were extremely fond of deer hunting. They were tireless walkers and some of them excellent marksmen. Sim and Daniel shot well, whilst Mulcolm and Billy and Sandy often missed. With them came Joe McM. and Angus McD. Poor Daniel had been thrown from a stage coach in the street of Columbia, S. C., and made a cripple for life. Still he loved hunting, and usually availed himself of the advantages of a small white pony which "Unicle Pickett" carried to the woods to take the deer to camp. On one occasion, we were driving some bogs not far from Blue's bridge, on Lumber River, and Daniel had ridden around to a point of one of the bogs nearest the river. Soon, a fawn was started and killed, and shortly thereafter Daniel's gun was heard. We always knew when one of the McL's shot, from the loud report following a heavy charge of gunpowder. After a short while we reached the spot where the lame hunter had placed himself, and found Daniel standing near a fine doc which he had shot. We made the usual inquiries, as to distance, position, etc., which he answered by saying that the deer was running her best, and was fully fifty yards from him when he shot. Sim looked doubting

edged the corn," and admitted that the doe was standing, and not more than ten yards from the muzzle of his gun. It was years before poor Daniel heard the last of that shot.

Sandy was a good fiddler, and invariably brought his Cremona to the camp to entertain us with music. The sweet strains from the violin were accompanied with the voices of Frank T. and Cyrus M., and thus the "nights drave on wi's sangs and clatter." Nearly all those lively spirits have fallen "like leaves in wintry weather," but the memory of their joyous faces still finds a lodgment in my mind, and I often sigh when I think of the happy days and nights which we have spent together, never again to return, beneath the spreading pines, whose sharp foliage made mournful melody in the autumnal breeze.

When we had ten or twelve in our party it was the custom to divide our forces into about an equal number and enterinto a friendly contest for superiority of skill or luck in hunting. On one occasion, after we had separated for a little more than an hour, the repeated heavy discharges of the McL. guns indicated clearly that they had started plenty of game and were doing their best to come off victors in the day's sport. So far we had not "made a raise," and began to fear that we should be "crowed over" when we got to camp. But in a short while the clear, sharp bark of old Ring was heard, and then the warning words, "Look out!" from Joe McM. The writer well knowing what this meant, hastened rapidly to the top of a knoll, and as he reached it he saw a fine doe running broadside, a little less than fifty yards off, which he saluted, in quick succession, with his Lewis & Tomes' 14-bore, 36in. barrels, 91bs., and soon brought her to the ground. Old Angus McD, then came up and congratulated me with the result, remarking that "those—Scotch couldn't now row" so londly. We walked together about one hundred yards, and, as we approached a small bog or swampy thicket, containing not more than an acre, he stated that he would walk through it, and perhaps might

scored two—the most glorious achievement of his life. A happier looking man I never saw. And that night, thanks to the unusual good fortune of Angus, the day's triumph was on our side, the other party having gotten but two deer, though they burnt much more gunpowder. Sandy, though on the losing side, got out his fiddle, and the woods resounded with the "Blue-tailed Fly," 'Old Uncle Ned," "Suwanne River" and other songs, which, though now not very fashionable, still contain far more of the soul of music than all the German or Italian products which can come from the brain of professional composers. With the strains of melody still warbling in the ear we lay down on our pallets, and soon soft slumber spread her gentle drapery over us, and we reposed until the morning "horn of the hunter was heard" calling us to a renewal of the healthful and exhilarating recreation.

Matural History.

WATER WITCHES.

WATER WITCHES.

THERE is no feature of Foreer AND STREAM which pleases me more than the pleasant little discussions on matters of natural history or natural science, which so frequently occur therein. They spring up spontaneously, so is seems, and are conducted with a good deal of spirit. Thus we had a debate long ago as to whether the polecat or skunk is or is not a natural reservoir of hydrophobia; then as to whether the moon shining on fresh fish will spoil them, or make their flesh poisonous as food; then as to whether robin redbreast is in the habit of getting drunk on china berries; then as to whether it ever rains frogs or fishes; then as to whether the mocking-bird is an imitator or an original songster, and now we have it hot on the tapis as to whether "water witches" and "divining rods" are facts or frauds.

I have sometimes taken a little part in these debates, when it so happened that I had any knowledge on the subjects involved. I have gained a good deal of instruction from these debates as well as entertainment. For instance, I was a firm believer that horsehairs did sometimes turn into snakes. I thoughtit was a very strange sort of transformation, but not a bit more strange than the jellyfish should turn into mollusks; mollusks into fishes; fishes into reptiles; reptiles into birds; birds into marsupial mammals; marsupial mammals into placental mammals; monkeys into men, and men into angels. Besides I could not resist what I took to be the evidence of my own senses—having once witnessed in a stagnant pool a quantity of wiggling things instinct with life, which had all the semblance of horsehairs turned into snakes. I sat over that stagnant pool fully half an hour, and could make nothing out of those wiggling things except horsehairs turned into snakes. I sat over that stagnant pool fully half an hour, and could make nothing out of those wiggling things except horsehairs turned into snakes. I sat over that stagnant pool fully half an hour, and could make nothing out of those wiggling things except

nest of the parasitic worm known as "Gordus." I have accepted their solution of the matter in entire good faith, but not without some mental reservation that they may be deceived and that I was right. However, we will not call up any uneasy spirit now.

In Texas those who believe that subterranean waters may be found by means of "divining rods" and who practice that faith, are known as "water witches." Their "divining rod" is the forked twig of some fruit-bearing tree, such as peach, plum or apple. It is usually green, but this is not necessary. When the "witch" proposes to locate a subterranean stream, he takes a branch of this forked twig in each hand with the butt end projecting forward, and then walks over the premises to be examined, with all the pomp, dignity and solemnity of an owl. Meantime he utters not a word. He is overwhelmed with a sense of the dignity and solemnity of the occasion. After having gone over the premises thoroughly, if the twig has not behaved itself after a peculiar fashion, he pronounces that there are no subterranean waters there, and that it would be time and money wasted to dig for a well. On the other hand, if he finds that the butt end of the twig at any particular spot is drawn downward, bending forcibly the slender branches held in his hands, he declares that beneath that spot there is a subterranean stream, and that if the well be dug there the stream will be tapped. If the downward indication of the butt end is feeble and slight, he says that the subterranean fountain is either very feeble or is very deep in the earth. On the other hand, if the downward inclination is very powerful, he declares that the subterranean waters are either very bold or but a short distance under the surface. He advises that a well be forthwith sunk on that spot, and most solemnly asserts that the water will be found.

Of these "witches" and their doings I have no particular experience, but there are thousands in Texas who religiously believe in them, and some of these are as intelligent and sensi

Englishman, then took the rod in his own hands, when it performed precisely in a similar way; whereupon the "witch" again declared him also to be a "witch," and one of the pronunced type. But the "witch" did not stop at that. He said to my friend that he would give him another manifestation of the virtue of his rod which would settle all doubts. He asked him to blindfold him completely, then to bring a gold watch or any other metallic treasure on the premises, and he would soon find it with his rod. All that the "witch" asked was that it be hidden not too far away so as to involve much walking to find, and that he be put only upon the

He asked him to blindfold him completely, then to oring a gold watch or any other metallic treasure on the premises, and he would soon find it with his rod. All that the "witch" asked was that it be hidden not too far away so as to involve much walking to find, and that he be put only upon the direction in which it was hidden. He was then completely blindfolded, and not only that, but the watch was hidden on a spot with a house intervening, so that it was impossible for the "witch" to see. He was given the direction in which the article was; he started out, and when he came immediately on the spot the rod performed its antics, and the "witch" indicated the exact place. My friend then took the rod in his own hands and it behaved likewise for him; whereupon the "witch" of the first water. The result of all this was that my friend procured a new force of diggers and a fresh supply of blasting powder. He went to work on the spot indicated by the divining rod, and as sure as fate, in a short time he had a glorious fountain of sparkling water on his premises. He blesses the day that ever he heard of "waterwitches" and divining rods, and will not permit them to be made light of in his presence. He claims that they are not only a true folk, but that he is a member of their honorable fraternity. Now, all of this is true; but as to what it proves, or does not prove, I leave others to their own conclusions. You will have to travel far to find a more sensible man than is my English friend referred to. He is well known in both Texas and England, is a fine writer, and will no doubt promptly respond to my statement in regard to himself and the "witches" if assailed. It is not held that every man is or can be a "water witch." The rod will perform only for a select few, but why this is so, or why these few should be so distinguished above their fellow creatures, I cannot pretend to say. You must go to somebothy with deeper philosophy than mine. The fact that some who claimed to have power with the divining rod have proved to be

Palestine, Texas.

THE ROAD-RUNNER.

THE ROAD-RUNNER.

THE road-runner, paisano or chapparal cock (Geococcyx californianus—Lesson), is one of the most interesting birds found in America. Its habitat includes Central Mexico, Middle Texas, New Mexico and California. The road-runner, as it is most commonly called, is quite abundant in the southern part of California. When not molested it becomes quite tame and loves to stay around houses. It commences to lay about the first of April. The eggs are white, varying from two to twelve in number and about the size of a pullet's egg (1.65x1.22). Few nests have been found containing more than ten eggs, but in 1881 I found two with twelve in. The nest is built in a thicket, low tree or a cactus, not far from the ground, composed mostly of sticks loosely laid to gether, and is usually very shallow. The bird often uses the same nest a second year.

The food of this bird consists of snakes, rats, lizards and insects. There are a great many tales told about this bird killing rattlesnakes. One is that it hedges in the rattlesnake with a circle of cactus joints, and the reptile in trying to get out becomes enraged, bites itself, and falls an easy prey to the bird. I dare say that this is a mistake, for I had the pleasure of seeing this noble bird kill a rattlesnake one day when I was up in a valley north of San Diego. The bird was quite shy at first, but soon managed to jump upon its victim, just behind its throat, and picked both of its eyes out. It did not eat the snake, but ran away as I approached. The road-runner has a very long tail, an erectile crest on the top of the hird is grayish spotted black. They are afraid of a dog, and when pursued by one they take refuge in a cactus if possible. Last month I went out with my dog and caught two; one I put my lat on while eyeing the dog. I gathered twenty-six eggs last year for exchange, all of which I found in cactus.

SAN DIEGO California.

HABITS OF CORMORANTS.

YEAR ago last Angust I made a note in Forest and Stream of finding the more northern cormorants (Graculus dilophus) nesting on trees in Illinois in company with the large blue heron and the larger white heron (Ardon Elyretta), all occupying exactly the same kind of nests and all three species having nests on the same tree, all with the young still in the nests, but about fledged, on the 22d day of America.

young still in the nests, but about hodged, on the 22d day of August.

Since coming here, until within the last three weeks, what I suppose to be the Mexican cormorant (Graeulus mexicanus) has been very abundant. They are known by the people along White River as "water turkerys" and "carrion geese." Along the White River there are a great many old river beds known here as lakes and bayous. These are full the year around with clear water. Many of them are quite deep and abound in fish, particularly black bass and perch. From these lakes bayous run out from a few feet to several rods and end gradually in shallow water. The smaller fish run up these bayous to feed and to get out of reach of the larger fish. The cormorants take advantage of this, and entering the mouth of a bayou, any number of them, from three to a dozen or more, all start together up the bayou, making all

the splashing and flopping possible, and scaring the fish which flee before them. The cormorants chase them in this way up into the shallow water at the head of the bayou, and which flee before them. The cormorants chase them in this way up into the shallow water at the head of the bayou, and then business commences at once; and if these cormorants don't eat fish like a cormorant, then I don't know how fast or how much a comporant can eat. I think that they can eat their full weight inside of ten seconds. Eat, did I say? There is no eating about it—the fish follow each other down their slender but india rubber throats in one continuous stream. And it is truly wonderful how large a fish they can get "outside" of without seeming effort, and how much they can eat. Then, when their meal is finished, they swim slowly back into the "lake," scramble up into some old treetop, and sit and digest their meal, preen their feathers in the sun and rest, and then in a few hours run their drag net up the same or some other bayou.

These ravenous, uncouth birds destroy myriads of young game fishes, and should be shot by the sportsman whenever a chance offers. But I think that they can stand more shooting than any bird of their size in the world. Their skin is very thick and strong, and is covered very thickly with a compact, strong mat of hair-like down, and over all is a heavy coat of thick, strong, hard feathers.

This appears to be a bird for which man has no use, for the interests of the two are entirely antagonistic to each other, and that nature has no use for in a country inhabited by man. One fisherman is enough in a country, and man should be that fisherman. Therefore the commorants, the herons and other fishing birds and animals should be destroyed. The skillful fishing of these cormorants in companies and armies shows them to have considerable intelligence.

Crockett's Buppe, Arkansas.

CROCKETT'S BLUFF, Arkansas.

Feathers from a Rattlesnake.—Mr. O. H. Keep, of this city, while in Louisiana shooting, noticed his dog, which was roading a bevy of quail, suddenly jump back and act in a strange manner. Approaching to learn the cause, he found a large rattlesnake, and at once opened tire upon him. At the second discharge he noticed quite a number of feathers that the charge had knocked from the body of the snake. Upon a closer examination he found that the charge had torn open the snake, exposing the body of a quail, and apparently there were several more in his capacious maw. The dog then took up the trail and soon led him to the bevy, which was evidently the one from which his snakeship had secured at least a portion of his meal.

A Captive Rall.—Bristol, Pa., Feb. 4, 1882.—A rail bird, in good condition, was caught alive at Cash Point, a few miles above Bristol, on the Delaware River, Jan. 30. Benj. Bradford, the captor, has caged the bird and will endeavor to keep him alive as a mid-winter curiosity. C. E. Scott.

ANMALS RECEIVED AT CENTRAL PARK MENAGERIE.—One blesshok (Alcclaphus albifrons), hab. South Africa; one leucoryx (Orga leucoryx), than North Africa; one promptom antelope (Antelocapra americana), hab. Western U. S. (all of the above purchased); one white crane (Grusumericana) and two golden engles (Aquida canadensis), presented by Mr. S. F. Emmons; two dusky ducks (Anos obscura), presented by Mr. C. A. Bradford, Vermont: one Mexican lizard (Meloderma horridand), presented by Mr. J. Silvie Durand; one sulphur-breasted toucan (Komphostos carriatus), hab. Mexico; one violet tanager (Endourant), hab. Europe; one vock thrush (Montton sucadilis), lab. Europe; one golden pheasants (Phasianus colchis), all purchases.

Game Bag and Gun.

THE DESTRUCTION OF LARGE GAME.

Editor Forest and Stream :

THE DESTRUCTION OF LARGE GAME.

Editor Forest and Stream:

"W.," in your issue of February 2, makes some good suggestions touching the preservation of the large game of the West. Proper license laws enacted by the States and Territories in interest, and then rigidly enforced, would have a very salutary effect and prove beneficial lin a double sense; first, in swelling the revenue, and, second, in preserving the game—by far the most important consideration. But how to frame such laws is rather a delicate question. Perhaps the license laws of Nova Scotia or New Brunswick would furnish a good guide for their provisions. They must be general in character and operate upon all non-residents alike. It will not do to level the proscription at the offending Englishman alone, although he would be the one most to feel it. It must be made to operate also upon the proxy as well as upon the principal, for reasons that 1 will presently show. The license should be limited as to time and also to the number of animals that may be killed under it. The fee should be high enough to insure the enforcement of the regulation, but not so high as to amount to a prohibition, because then it would be disregarded in frontier and sparsely settled sections of the country.

In approaching a license plan two serious difficulties are to be met. First, the deep-rooted American prejudice that all natural products of their land must be free for everybody's use. It is this principle which opens to all the world alike our gold and silver fields. The rule is different in other countries. Second, the foreign sportsuen who come to our mountains and plains are royal providers. They spend money prodigally. They pay to guides, hunters, servants and ranchmen ligher prices for their services, their horses or their supplies, than can be obtained from any one else or in any other way, and this fact enlists the interest and the sympathics of all these people, their neighbors and friends, upon the side of the lordly huntsmen. And these influences are strongly f

loss, and doubtless a good many elk and deer, but probably not many more than were needed to feed the men and dogs

loss, and doubtless a good many elk and deer, but probably not many more than were needed to feed the men and dogs of the company.

The next fall an Englishman who has hunted a great deal in Africa, came over and entered the mountains late in October. An agent had made preparations before his arrival and he was soon in the field with numerous servants and horses. Among others he employed two local game butchers who knew the country, the game and its haunts thoroughly, and they did most of the killing. The slaughter lasted five or six days and the bag was between sixty or seventy elk, a large number of deer and antelope, two or three bears, one cougar, or mountain lion, a glutton and some smaller animals. They falled to get any mountain sheep, at which our English friend was much chagrined. Here was the destruction of at least fifteen tons of good meat, worth in our local markets not less than two thousand dollars. The hunters referred to had permission to get it out and sell it, and I think did succeed in selling two wagon loads; probably a couple of tons. The balance rotted where it felt. This man paid high prices; presented each of his hunters a latest improved Sharps rifle to begin with, and when he left the field the outfit procured for the hunt, even to saddle horses, was divided among his men. It would be hard to collect a shooting license of him, if it had to be collected in that neighborhood, unless he chose to pay, for reasons that are very obvious. His object was to secure "heads" and make a big score; of course by the time he reached home all of this slaughter by several men was counted as his own. Why not? They were hired by him and well paid for the bloody work. Since that date I have not heard of a foreign sportsman killing game enough in this State to brag much about. However, I have scarcely been in the hunting grounds for three years past.

If the Englishmen are left to their own devices there is not much danger to the game. As a local hunter said to me last summer when we were discussing this not many more than were needed to feed the men and dogs of the company.

The next fall an Englishman who has hunted a great deal

DENVER, Col.

MIGRATORY QUAIL.

The importation of the common quail (Coturnix communis)

The importation of the common quail (Convaix communis) of Europe for the purpose of adding to the fauna of North America, a bird worthy of the esteem of sportsmen, farmers, and epicures, was commenced in 1877 by Judge Martin G. Everts, Esq. of Rutland, Vermont, by the purchase and liberation of 290 quails. In 1878 there were 5,090 quails imported alive to America and liberated in various localities. In 1879 there were about 3,060 imported, and of these there were 100 liberated in the State of Maine.

My interest in ornithology and field sports prompted me to introduce this subject in an address delivered before the "Sagadahoc Association" at Brunswick, Me., in 1879, with the object of raising a fund by general subscriptions sufficient to purchase a large number of quails for liberation throughou this State. As a result, general contributions were received within a short time, and early in June, 1880, I received 2,600 migratory quails from Italy. (More than one-half the whole importation to America for that year.) These birds arrived in good condition and with but slight loss in numbers, and were distributed in nearly every county of our extensive State. I recommended that not less than fifteen or twenty quails should be liberated in each lot, and this was generally done, although their numbers were divided into smaller lots in some instances. In nearly every case some of these birds nested in instances. In nearly every case some of these birds nested in the immediate vicinity of their liberation, others nested a lumified miles (less than three hours flight for these birds)

distant from the nearest place of liberation. Many nests with eggs were found. Some of these were destroyed by mowing machines, some nests were described after being mowed over and left exposed, and many birds were captured by the domestic cats. Yet it was fair to presume that a good number escaped all these evils and migrated South in the

number escaped all these evils and migrated South in the autumn.

In the Maine "Report of the Commissioners of Fisheries and Game" for the year 1880, I gave an account of the migratory qualls, their introduction to Maine, and results so far as then observed, also some description of their nests, habits, etc. I looked forward with interest to learn if my confident prediction of the return of some of these birds and their native born progeny would be verified in the spring of 1881, as none were imported for liberation in Maine in 1881. It was known that should any appear here then, they could only come by return migration from the South. Through Forest and Stream and other mediums I requested all persons who might observe any of these qualls to report the facts to me, and I would be grateful now, or at any future time, for any information concerning the migratory quils in America. As migratory qualls were observed in Maine during the spring of 1881, and at dates earlier than the liberation in other localities of any newly imported birds, the fact is established that the qualls have returned.

I have received reliable evidence of their appearance in various parts of this State, from the Saco River valley in the West, to the St. Croix River on the Eastern boundry. I quote from a few of the reports received.

"Dayton, Me., May 2, 1881.—The qualls that nested on my block lest summer have returned the morning. Fire in

quote from a few of the reports received.

"Dayton, Me., May 2, 1881.—The quails that nosted on my place last summer have returned this morning. Five in number.—G. W. Rumery."

"Bath, Me., May 2, 1881.—Mr. W. T. Dunton saw two quails last week on his farm, within the limits of this city.—C. H. Greenleaf."

"Wiscasset, Me., May 9, 1881.—The quails that I liberated last year have returned. They were seen for the first time on May 5, in the very field in which they were hatched.—W. G. Hubbard."

During the latter part of April, Mr. W. W. Castle, of Bel-

on May 5, in the very field in which they were hatched.—W. G. Hubbard."

During the latter part of April, Mr. W. W. Castle, of Belfast, Me., reported fidding several qualis, while accompanied by his setter dogs, in the immediate vicinity of that city. These were the first arrivals reported, and a comparison of dates fixes the early part of May as the date of their general appearance in Maine, for that senson, (1881).

Samuel Atwood, Esq. writes from Winterport, Me., under date of May 24, 1881; "Il have for the last two weeks looked early and late, and this evening was rewarded with the sight of two qualis, and the sound of quite a number."

The notes of the migratory quail are unmistakable and not to be confounded with the notes of any of our native birds, and their general appearance and flight differ widely from those of any other birds found in Maine. Sometimes, when flushed, the migratory quail repeats a low, trilling note as it flies away. This note resembles the ordinary cry of the pectoral sandpiper, (Tringa maceulata) but is softer, and only to be heard when uttered within a few rods of the ilstener. But the ordinary notes of the male quail, so frequently the search of the search when uttered within a few rods of the ilstener. fulses away. This note resembles the ordinary cry of the pectoral sandpiper, (Tringa maculata) but is softer, and only to be heard when uttered within a few rods of the listener. But the ordinary notes of the male quail, so frequently uttered at morning and evening during the months of May and June, (later the bird is comparatively silent) are clear and penetrating, and on a still day may be heard at a distance of nearly a half mile. I can best express these notes in words by the syllables, whereat, wheat, wheat! The crescendo, "who," of the first note, can be heard only when very near the listener. The call may be easily imitated by the whistle, but when uttered by the quail, it is of a ventriloqued nature, and the listener who hears the rapidly repeated "wheat, wheat" of the two terminal notes at a distance of several hundred yards, is apt to be misled into the belief that the bird is at a distance very much nearer than a search will prove it to be. Previous to the misled into the belief that the bird is at a distance very much nearer than a search will prove it to be. The violation of the same interest of the two terminal notes are distincted in numbers of but a few pairs to each locality selected. But the experiment in Maine was made by a systematic distribution over a definite territory, of a sufficiently large number of birds to warrant a reasonable expectation of success. Besides the 2,600 quails distributed in Maine in 1880, there were 1,700 distributed in other States, and 800 in Canada. Col. Wm. Rhodes, a public-spirited gentleman and sportsman of Quebec, has liberated a number at his own private expense, and in a recent letter informs me that he will repeat the experiment this year. In an interesting letter giving me memoranda of the quails liberated in Canada, Col. Rhodes expressed the hope that these birds may find "the great barrens of the Laurentides," suitable for their breading. It is my belief, however, that the cultivated fields of the valley of the St. Lawrence River will be a more favorable

attempts that their introduction became permanently successful.

As regards the migratory quaits, it should be borne in mind that they are terrestrial birds, rarely alighting elsewhere than on the ground, and their buff brown plumage and habit of hiding in the grass, or running swiftly away at the approach of danger rather than seeking safety by flight, readers them not easily observed. Hence but few might be seen even where abundant, and to become appreciably abundant throughout a territory so wide 2s that extending from the Atlantic Ocean to the Mississippi River their numbers must be millions. These quaits are so prolific (laying from eight to eighteen eggs in a nest) that a few years of successful breeding would yield a compound interest on the few thousands distributed as seed, and their numbers would become as great as now attained by the domestic sparrows. Prolably the success of the introduction of the migratory qualist of America could best be insured by the liberation of a considerable number in the same favorable localities for several consecutive years.

I will again ask all persons who may learn of the return of any qualls this year, especially if in the State of Maine or in Cauada, to inform me by mail to the address below given. It is now a matter of record that after nesting and hatching their young in Maine and migrating South in the autumn, the qualls have returned in the spring. Evenett Surin. Pearland. Maine, Jan. 16, 1882.

LOADING FOR GAME.

LOADING FOR GAME.

LOADING FOR GAME.

LOADING FOR GAME.

Load for game, appear to contain simply the results of individual experience, without containing information that will permit that experience to be utilized to the fullest extent by others. In this, as in all other matters, the best results are attainable only through a knowledge of the underlying principles involved, and the application of them to the particular cases in point. In loading for game no less than five variable factors enter into the question. These are, 1. the man; 2, the gan; 3, the ammunition; 4, the manner in which it is arranged in the shell; 5, the kind of game sought and the manner of seeking it. That which follows is intended to relate simply to breech-loaders and to loading for field work, not to blind, boat, or punt shooting.

1. A man in good physical condition should be able to traup the fields or forests where walking is ordinarily good, and to carry without undue fatigue a gan weighing not more than one-twentieth of his own weight; c, g., an 8lb, gun for a 160lb. man. A gun much heavier than this will, before the day is out, prove a burden rather than a source of pleasure, while one much lighter, other things equal, will not on the average secure us much game.

2. The gun chosen for field work will be either a 16, 12 or 10-gauge, the 20-gauge has hardly come into fashion with us yet, and 8 and 4 gauges are reserved for wild-fowling. The gam will be either cylinder, half or full choke; and should burn without excessive recoil a charge of rather quick powder, equal to one draching avoidupoits for every two pounds of gun. This may be taken as the maximum charge that can ordinarily be shot with comfort forty or fifty times a day. For most occasions a smaller charge is preferable.

3. Ammunition. Powders vary as 10 quickness of combustion, due to their composition, mode of manufacture, and to the size of grain. Orange lightning may be taken as the basis of computation and comparison both as to character and size, and the following r

size, and equal measures of two different sizes being taken, the fine shot will weigh more than the large.

4. The relative proportions of the powder and shot, and the mode of wadding exert an important influence upon the results. To facilitate an understanding of this, the most difficult factor in successful loading, we give a table showing the ratio of powder to shot, through the entire list of practicable loads, for guns varying between 16 and 10 gauge and weighing from 8 to 121bs.

RATIO OF POWDER AND SHOT Rutio. Drachms Onnces Powder, Shot, 1-6 1-57-13 1-51-7 1-55-7 1-51-5

The pattern that is, and be reached to compromise the matter, and seek neither extreme pattern of 1-57. The writer had so it 1-51. The pattern that is, a ratio of 1-57. The writer had so it it will be seen, then, that its pattern by varying the proportion of the other more powder, and to obtained, while if card wad only be placed over shot, a more powder, and to obtained, while if card wad only be placed over shot, a more powder, and to obtained, while if card wad only be placed over shot, a more powder, and to obtained, while if card wad only be placed over shot, a more powder, and to obtain the same to 1-57. The writer, however, must can be ended to comprome the more powder, and so inch is the more powder, within certain limits, undoubtedly secures these advantages, but will increase its scattering. When you reach the proportion of believe to depend on under ordinary circumstances. Host sportsmen, however, make an effort to compromise the matter, and seek neither extreme pattern on the one hand nor extreme range and penetration of the charge of 34 drachms to 1-50 mer powder, and to obtain the maximum of killing power would employ 32 drachms to 14 ounces for a 7½10, gun—that is, a ratio of 1-57. The writer, however, must confess a preference for a little more powder, and to obtain the maximum of killing power would employ 32 drachms to 14 ounces for a 7½10, gun—that is, a ratio of 1-54. It will be seen, then, that the gun may be made to shoot with a thicker or a thinner pattern by varying the proportion of the powder to the shot.

The pattern, however, is modified by manner of loading. If for instance two pink-edge wads over powder and a card-board over shot are employed, a close pattern will be obtained, while if card wad only be placed over shot, a more open pottern will result. It is evident, therefore, that a shooten may modify his pattern in two ways, the gun itself remaining the same. The size of the powder is used the powder will be considered, and it may be stated as a general proposition that the fine

influence are so wen unaccessors.

Illuded to.

Having now considered the principles that influence pattern, penetration and range, and having shown that these are simple and easily applied, it only remains to show how they

should be applied with reference to the different varieties of game. This we will illustrate by a few examples, and will speak first of birds that are usually shot singly, as, for instance, the rail. This is a small bird that rises a few yards from the shooter, follows a horizontal flight for ten or twenty yards, and drops out of sight. A 16-gauge hammerless is certainly the ideal gan for this bird. If closely choked it may either miss him entirely or ruin him for the table if he catches the centre of the charge. It is better, therefore, to sacrifice something in the way of pattern. With a cylinder gan we cannot afford to do this. With the 16-gauge choke-bore, then, we would use 24 its. to \$00, or, as maximum charge, 24 drs. to \$00, or, as maximum charge, 24 drs. to \$00, or, as maximum charge, 24 drs. to \$100, and the cylinder gan we would use 24 its. With quali it is different. This bird may rise at a distance, thy rapidly, and be thirty or forty yards away before the shot can reach him. Under these circumstances the choke-bore exhibits its advantages over the cylinder. Now, you must have powder enough to drive your shot the required distance, and owing to the choke can afford to sacrifice the pattern a little. Hence 3drs. to 102 will prove more likely to kill than the loads just mentioned. If single shots at larger birds are expected, a larger gan loaded in accordance with the same principles should be used.

Thus far we have spoken with reference to loading for single birds. In loading for flocks the writer has had no experience, as he does not remember ever having loaded with this special end in view. How professional gunners load for locks the following narrations will show. Conversing a couple of months ago with a Southside bayman, we asked him, "How do you load for bay snipe?" He replied, in substance, that he never shot at single birds except the large sort, jack-curlew, etc., as ammunition was expensive, but reserved his charge for flocks, loading his double 8-bore muzzle-loader with 6drs. FFG and 2028

ON THE WING, OR ON A LOG?

ON THE WING, OR ON A LOG?

QUITE a controversy has sprung up between some of our earnest sportsmen as to whether it is a proper thing to shoot ruffed grouse except on the wing.

Although this is simply a war of words, yet, like all wars, it will most likely end in a compromise.

Most of us have vanity enough to believe we can bring down all the birds we want after flushing and before they can get out of range. It stimulates our pride and flatters our vanity to do so. But suppose, like the boy digging at the woodehnek's hole, you were 'out of meat and the minister was coming," and your faithful spaniel should 'tree' a grouse in a thick undergrowth, where to shoot him on the wing would be bordering on impossible, what would the average common-sense sportsman do? Swing his hat, scare him off, and trust to the precarious chance of finding him again under more favorable circumstances, or walk deliberately away, leaving the game alone in his glory, or would he take the shortest cut to get what he was after, and proceed to knock the bird out of that tree with a charge of No. 6's? On the principle that "a bird in hand is worth two in the bush," I honestly believe that every "pot-hunter," every farmer's boy and nine-tenths of the sportsmen of this country (I do not include sportsmen shooting in English or American preserves) would bag that bird then and there. I am free to confess I have done it, and under like circumstances will do it again, notwithstanding my love and admiration for wing shooting:

Wing shooting is an acquired art, practiced not to increase

Wing shooting is an acquired art, practiced not to increase wing shooting is an acquired art, practiced not to increase in the contract of the Wing shooting is an acquired art, practiced not to increase our bug, but to enhance our pleasure. It should be encouraged and practiced by all true lovers of manly field sports. But it appears to me to work no blemish upon his character for the sportsman to show good sense as well as good shooting, and not to be afraid or ashamed to shoot a deer or bear standing, a squirrel on a limb, or a ruffed grouse on a tree. Compromise then, and agree to shoot the grouse on the wing if you can, but if you see you cannot, shoot all the same.

The following case of native simplicity forced me to this

To my surprise I saw him flat on his belly, with a look of astonishment on his face that I was not in a like position. I had previously told him that the dogs would stop and "point" when they found a bird. I beckoned to him to lie still, and looking out a clear place to shoot, walked up and flushed the bird. Luckily it rose fair and tumbled to the bottom of the ravine. Frank had no retrieving to do; that boy had that ruffed grouse by the neck before the dogs could fairly flatten out on their "down charge." He came back to me with a face brilliant with approving smiles and said: "Is that the way you do it, by golly?"

"Is that the way shoot them on the wing, when we can."

cam."
"Well, by golly! You may do it that way, but sitting on a log is good enough for me."

CLEVELAND, O.

ECHOES FROM OLD FRIENDS.

TOTWITHSTANDING its narrow escape from cremation,

ECHOES FROM OLD FRIENDS.

TOTWITHSTANDING is narrow escape from cremation, the Forest and Stream is full and fat, and better looking than ever in its new dress. You are to be congratulated on your exemption from the fate of your unfortunate neighbors. You were near enough. I imagine, to suffer somewhat from the general chaos that ensued, and to get upon you the smell of the flames by which they were consumed. I will not say more, for I suppose that since the disaster you have become surfeited with this kind of talk. Yet my interest in the Forest and Stream and its staff has led me to give this sincere expression of my delight at their escape with so little damage.

I learn from the Chatham *Conrier** that Ken, the "astrological genius" of the "Costly Perch" story, made another creditable record last season, for a business man who can only snatch a day now and then for the sport that he supremely loves. He caught #18 trout, aggregating #8 pounds and 7 ounces. He also took 203 black bass from the waters of the Mohawk River and Copake Lake, of good average weight. His "signs" must have been truer to him than they were on that Lake Richmond expedition. By the way, as to "signs," concerning which you invite discussion, there is na Batavia, III, a Swede, by the name of Kindblode, who is something of an expert with the rod and fly, who says that he has always found that fishing is poor when the nights are light, enabling the fish to feed. His sign was in the moon, and I am strongly disposed to accept its plausibility from the added evidence of my own observation and experience, I can testify that fish do bite better on the mornings that follow, and the evenings that precede dark nights.

A friend of mine, whom I left behind in Illinois when I moved East, writes me about a piece of bad luck that he had last November. He, with another friend, went to MeHenry for two day's sport, at duck shooting. He hired a breechloader at a cost of \$10, laid in a stock of 150 shells, and expressed his boat on ahead of them, so as to be PATERSON, N. J.

FOXES TAKE TO WATER.

FOXES TAKE TO WATER.

VOUR correspondent, Mr. I. C. Lodor, in Forest and Stream of January 26, asks if foxes ever take to water. I will relate what I saw about two weeks ago. I live on a branch of Miles River, in Talbot county. Maryiand. Two weeks ago last Wednesday I was on board my yacht with a party of gentlemen. We were about to leave our moorings for a ducking trip, when we heard the hounds and soon saw them coming across a field to our right. All of the pack, with the exception of one dog, seemed to overshoot the trail, as they kept on toward a cove muking into the side of the creek they were on. The one hound took a trail at a right angle to the course of the rest of the pack, and ran it out to a point on the bank of the creek just below where we were anchored. This called our attention to the fox, which we soon espied in the water very leisurely making his way to the other side, the creek at this point being about 250 yards wide. He swam quite high in the water, nearly the whole of his tail being on the surface. The rest of the pack, soon discovered their mistake and came back and took up the trail to where Repnard had taken to the water, have the recy cold water seemed to cool their ardor, as they refused to follow the fox, which had by this time landed on the opposite bank, and after giving himself a shake or two bounded up the bank and disappeared. Several of the gentlemen, who were following the hounds, had by this time arrived on the bank of the creek, and seeing their trouble, I sent one of our party with our skiff, who ferried the dogs over and put them on the trail while the hunt rode round the head of the creek. How the hunt reminated I cannot say, as I have not seen any of the hunters since my return from my shooting trip.

It is a very common thing for foxes to take to water in our

The following case of native simplicity forced me to this compromise:

Several years ago, with a fine brace of pointers, Frank and Dash, I left a little town on the Ohio Canal some thirty miles from Cleveland, after an early breakfast, for the "Sedges," a well known partridge ground east of the winding Cuyahoga. Before I got out of the little hamlet, a ragged little bright eyed smart-looking country boy, between twelve and four ten years of age, came trudging along at my heels. I said: "Where are you going, my boy?"

"Hunting with you, if you'll left me."

"You do not look stout enough to stand the fatigue of the tramp I am about to make. Don't you go to school?"

"Yes, but I'm runnin' away to-day to show you where the partridges is. I knowed you was going hunting, for I see you and them big dogs last night at the taver."

"Are you not afraid of getting a whipping by both your teacher and your parents?"

"No; but I expect to have to lie some. I'll tell the teacher I had the belly-ache, and I'll tell pap Fve been to school and din't want no dinuer."

At this I smiled audibly, and believing in his unsophisis cated honesty, and that he might show me some new grounds, as he declared he could, I told him to come along, keep close to me and stop still when I did. He promised faithfulness in everything. We soon turated into a thicket in a deep gally at his suggestion and had proceeded but a few rods, when Frank stilfrend out and Dash boacked him beautifully. I supped and looked back to see if the boy had stopped toe,

similarly colonized. The last of this colony I caught the past spring, an account of which I published. I have on two occasions pressed a red fox so closely that after a hotly contested run up the Roanoke for fifteen miles, he did "take water" and cross that stream at a width of some 300 yards

water" and cross that stream at a width of some 300 yards and escaped.

It is different with the gray. He never "takes water," unless in so close a quarter as to make his escape otherwise impossible. This I have witnessed but once during my entire hunting experience of more than 40 years.

The red fox never resorts to such "stratagems" on "thin ice and air holes," as stated by Forest and Stream; indeed, he cannot be regarded as strategic, he relies entirely upon his heels and holes, which are ample for all purposes of escape, unless pursued by a true, speedy and determined pack. The gray, however, is up to all tricks and stratagems. But he never has a prepared hole to resort to in emergencies, and only when outfooted and cornered will he take a tree or water. In his night rambles he never "takes water," and even his usual crossings over small streams will be avoided, if from any cause the volume of water be perceptibly increased. If he once escaped by taking a tree, he will repeat the experiment whenever he thinks his safety is secured by doing so. I have never known a red fox to do so, or even attempt it.

(Mayrox, North Carolina.

THE MONTREAL SOCIETY.

MONTREAL, Jan. 29, 1882.

Montheal, Jan. 29, 1882.

Editor Forest and Stream:

The fifth annual dinner of the Fish and Game Protection Club was held at the St. Lawrence Hotel, in this city, last morning, Jan. 26th. Like former meetings of the Club, it was a most happy affair, and everything passed off most pleasantly. The Club, by the way, is not one of those societies which devote so much attention to their annual dinners that they have no time nor strength for anything else. The report of the Secretary, which is appended, shows that the society is accomplishing much good.

At the gathering last night, Alderman Wilson, President of the Club, presided, and among those present were Messrs. Dugas, Boyer, E. C. Monk, G. Boivin, J. S. Hall, F. Henshaw, H. W. Matthews (Secretary), S. Cross, Provencher, L. Sutherland, Torrance, Fenwick, Geo. McKinnon, Hanson and others. Dr. Mayrand, President of the Argenteuil Fish and Game Protection Club, was also present. Letters of regret at non-attendance were received from Hon. E.-J. Flynn, Commissioner of Crown Lands: Mr. Whitcher, Deputy Minister of Marine, Mr. Proulx, Chief Game Overseer of Quebec, and the President of the Eastern Townships Fish and Game Club.

After the party had discussed the good things provided.

ister of Marine, Mr. Proulx, Chief Game Overseer of Quebee, and the President of the Eastern Townships Fish and Game Club.

After the party had discussed the good things provided, toasts were drunk to "The Queen; The Governor-General; and The Dominion Parliament." The Chairman gave the "Quebee Parliament," and in doing so said the Club was much indebted for legislation to the Quebee Legislature. He hoped that this year the Club would succeed in obtaining amendments to the existing game laws of the Province, with a view of preventing the shooting of duck in spring. The "Army and Navy Volunteers" was the next sentiment. Mr. Dugas sang "Le Chasseur," which was heartily joined in by the meeting. Mr. Geo, Ahern also gave "Britannia, the Pride of the Ocen..." "Our sister societies in Canada" was the next toast given by the chairman. In doing so he said he knew that this toast would be drunk with enthusiasm. In reading over the bill of fare he noticed that the toast was to the sister societies of Canada only. He would ask permission to include in it the fish and game clubs of the United States. He was happy to say that he had received a letter and a copy of the by-laws of the Cincinnati club, which fact showed that the feeling which should prevail among the clubs should be continental, and not provincial. The toast was drunk with much enthusiasm. Dr. Mayrand, who was called upon to respond to the toast, returned thanks for the St. Andrew's Society of Argenteuil. Mr. Beaugrand then proposed "Our Guests." Mr. E. Roy responded to the toast, and in doing so spoke as counsel for the Society, and referred to several instances connected with the prosecution of parties contravening the fish and game havs. He pointed out instances in which the greatest destruction of fish and game had been prevented, and in other instances where parties had been punished. Mr. E. C. Monk then gave "The Press," and in doing so said that the Club owed the greatest amount of gratitude for the services which the press had rendered the Club. He hope

SECRETARY'S REPORT.

SECRETARY'S REPORT.

Your committee, in reporting the work done by the club during the past year, has much pleasure in stating that the laws for the protection of fish and game have been much better observed than in the past, that the sale of fish and game llegally killed has become very rare in Montreal, and that the club is now in a better position to carry their prosecutions into the more distant districts of the province.

The results of the work done by the club are most gratifying. The catch of game lish during the past summer has not been equalled for many years. Especially may be noticed bass and maskinonge. The catch of the former was very large, and the fish of good size and in good condition; but the most marked results were shown in the great increase of maskinonge, a catch of two, three, and even four fish being no uncommon occurrence, these fish running from 10 to 40 pounds. pounds

Your committee commenced the work of the year by causing Tour commune commence the work of the year of causing copies of the fish and game laws to be posted in nearly every town, viliage and railroad station in the provinces, and the distribution of eards containing the same and offering rewards for the conviction of persons infringing these laws, and during the past year rewards have accordingly been paid in

six cases.

The club have prosecuted in sixteen cases, in eight of a litch convictions have been obtained. Six were dismissed for want of sufficient evidence and two are yet panding. The clap have also made several seizures of fish and game, and distributed the same among the several hospitals of the clay. In these cases the club did not prosecute as there was evidence

to show that the parties infringing the laws did so in ignor-

The thanks of the club are again due to Mr. Euclide Roy, advocate, who has given his professional services to the club gratis, for the able manner in which he has conducted our

Your committee regret that the bill for the amendment of the game laws affording better protection to duck and other game during the breeding was not passed last session owing to strong opposition. The great necessity for these amendments is shown by the statement which the chairman of the murket committee has been kind enough to furnish the club, which shows that over 1,000 brace of black ducks came to Montreal market during the breeding season last spring. Your committee, however, have strong grounds for hoping that the necessary amendments will be made during next session. The thanks of the club are due to Messrs. Bover and Monk, who at great inconvenience to themselves went to Quebec last spring, and in spite of the strong opposition did all that could possibly be done, to have these amendments made.

Your committee regret to report that the river Beaudet, a most valuable breeding-ground, has been illegally fished by a notorious poacher living in the neighborhood, and that owing to local magistrates refusing to sit on the case and the unwillingness of the inhabitants to give evidence, the club have been unable to bring this man to justice, but after some correspondence with the Government on the subject, the Department have kindly agreed to appoint a fishery officer especially for the protection of this river. During the early nart of the Your committee regret that the bill for the amendment of

been unable to bring this man to justice, but after some correspondence with the Government on the subject, the Department have kindly agreed to appoint a fishery officer especially for the protection of this river. During the early part of the session, it was reported to the club that Americans are there again using punt-guus on Lake St. Frances, and also killing ducks in close season on the lower part of the lake. Mr. John Morrice, the Guard de Chasse, was sent up and remained on the ground some time, and though he did not succeed in bringing the offenders to justice, his presence put an end to the poaching. This lake, lying as it does between the two provinces, is very hard to protect, as the game laws of Ontario do not coincide with those of Quebec.

During the past year 116 new members have been added to the list of the club, making at present a membership of 286.

In retiring, your committee would suggest to their successors the advisability of some amendment to the granting of licences for netting. At present a license is granted on almost any respectable person's application, and consequently a great number of people have nets set for private use, taking a large quantity of fish and using only the best. Such people could take all they required by rod and line, and if a charge of five or ten dellars was made for a license the rivers would not be constantly blocked by nets, and the professional fisherman would willingly pay it. Thus a revenue might be raised for the better payment of the fishery officers, and the public would greatly benefit by the large increase in fish. All of which is respectfully submitted, G. H. Matthews, Secretary.

CANADIAN.

The Star Mountain Buck.—The Watertown, N. Y., Times says: "The bearer of the above name was a buck of huge proportions which for six or seven years has been the target of North Woods sportsmen in the region of Star Mountain, near Paul Smith's, but which until last season bore a charmed life, together with numerous rifle balls. Then he fell a prey to the unerring aim of T. Irwin, Jr., of Oswego, who procured his head and antlers, to be beautifully "set up" by a New York taxidermist, from whom he has lately received the splendid trophy. The buck, when killed, weighed 400 pounds, while the average weight of those killed in the Adirondacks is less than 200. This fellow, with his long, splendid antlers, has long been the much-coveted prize of several New York sportsmen."

A January Woodcoek.—Locust Valley, L. I.—Was it a laggard or an early bird? In the second week of January a woodcoek was flushed by the spring near our kennels at Locust Valley. Is it not an unusual thing in this latitude?—GORDEN KENNEL. [It was probably a laggard. We once killed a woodcoek in Connecticut on Christmas Day, which we decided to be a crippled bird that had been left behind. Woodcoek often reach this latitude as early as February. Some thirty years ago, in Connecticut, we were out on Washington's Birthday, Feb. 22, and found a woodcock's nest with three eggs in it. It was a very early season that year.] year.]

A Georgia Resort.—Editor Forest and Stream: I am in receipt of a letter from Mrs. R. J. Screven, Dorchester, Liberty county, Ga., offering to take boarders. Every room in her new house has a fire-place. Game in the fields and the rivers would give abundant recreation to gentlemen. Thousands of bushels of oysters lie in the creeks free to everybody. This place is a paradise for sportsmen. The town is reached by railroad from Savannah to Jacksonville, stopping at McIntosh Station, where parties will be met by Mrs. S. if notified ahead.—D. T. Bunker. (Auburndale, Mass.)

The Antlers of "Old Alex."—Pittsburgh, Pa., Feb. 1.
—Last Thursday evening a party of gentlemen called on Mr. E. W. Watson and presented him with an elegant gold-mounted Smith & Wesson revolver. Mr. Watson, in return, presented the club with the antlers of the famous buck "Old Alex.," which he killed in the mountains near Confluence. Both parties were completely surprised, and hereafter the antlers will prove one of the valued relics of the club.

St. Clair Flats.—Mr. Plumb, of Niagara, Canada, advertises this week shares for sale in a shooting club located at this famous resort for wild fowl. We presume that they will readily find purchasers, as this is one of the best localities for game in the West, and we often record the results of royal sport enjoyed by the frequenters of this sportsman's paradise.

Kent County Club.—Grand Rapids, Mich., Feb. 2, 1882.
—Officers of the Kent County Sportsmen's Club, of Grand Rapids, Mich., for 1882: President, E. S. Holmes; Vice President, Harry Widdicomb; Secretary, A. B. Richmond; Treasurer, Wm. H. Calkins, who with the following gentlemen constitute the Board of Directors—Geo. S. Baars, J. C. Parker, Geo. A. Gould, Ed. M. Barnard, and L. D. Follett.

A sage hen-one who avoids the hawk. Columbus made the egg stand, but Italians of less renown have made the pea-nut stand. These jokes were hatched by the *Evening Post*.

An Article from "P.," on the Trajectory Curves of Sporting Rifles, will be published in our next issue.

SUNDAY SHOOTING IN CALIFORNIA.

Boston, Jan. 28, 1882

Boston, Jan. 28, 1889.

Editor Forest and Stream:

I have just laid down your issue of Jan. 26, containing the Sacramento Bee's comments on "The Hunter's Train."

The writer agrees partially with me, but argues that the birds will not be noticeably depleted next season, and that the Sunday hunter has much to excuse him as Sunday is the only day he can leave his labor and indulge in recreation. Granted, He admits, however, that if the same army should invade the quail grounds it might be very disastrous. There is also a limt to the effect "that he who is without sin should cast the first stone."

hint to the effect "that he who is without sin should cast the first stone."

In the first place I will "cry peccavi" and admit that I have done more or less shooting on Sunday in California which I can only excuse on the ground that it was perfectly legal so to do, but nevertheless I think it was bad for the birds, and the very fact that I wish to have a law passed forbidding me to shoot on Sunday shows that I am at least sincere, especially as I am going to shoot in California next winter.

Locking the stable door after the horse has been stolen is the great fault of our people and legislators, and in no case is this more true than in the matter of game laws.

There are many things which tend to bring about this result, and these have been argued and explained in Forest AND STREAM time and again far more logically and forcibly than I can hope to do.

than I can hope to do.

As long as game is abundant the attempt to check the kill-As long as game is abundant the attempt to check the killing of it in any way is looked upon by many as a species of "class legislation." I shall not try to discuss this question at any length. "Ogfensburg" in your last issue has thoroughly gone over the ground and hits the nail on the head.

I can only argue that it is no more class legislation for the government to say "you shall not shoot during certain months" or "you shall not shoot of uring certain months" or "you shall not shoot on Sunday" than it is for it to say "you shall not fire off your gun within the city limits.

"The greatest good to the greatest number must be the way."

to say "you shall not fire off your gun within the city limits."

The greatest good to the greatest number must be the rule, and the fact that A B and C lose a certain amount of pleasure has nothing to do with the question.

It is only when the game is nearly exterminated that legislators open their eyes and hastily pass game laws twice as strict as there would have been any necessity for ten years previous, and then, perhaps, they will spend thousands of dollars in vainly trying to restock the depleted preserves and empty streams.

"A stitch in time saves nine," nowhere applies with more force than on the question of game protection. California is a new and very large State. Her game supply is enormous, and with a little foresight and care, there is no reason why it should not remain so for many generations. But the very fact that game is so plenty has also made the hunters plenty, and to preserve the game supply strict and well enforced protective laws are getting to be absolutely essential.

iters pierry, and le enforced protective laws are general as a le enfail.

Ill enforced protective laws are general as a letter and the law in the law advanced the fact as an argument at they do not need the same protection as the native de.

that they do not need the same protection as the native birds.

Again, this "army" does not limit its operations to the Ahameda marshes. It is merely an example of what is being done to a greater or less extent throughout the whole State and through the whole year. Not only Sundays, but week days. Not only during the open season but during the close season, and, of course, the quali suffer as well as the ducks.

Let me quote a passage from an article written by me for one of the California papers in the summer of 1878: "There is in Lake county a total disregard of the game laws, deer, quail and trout being killed and caught all the year round. There has been no notice taken of the law prohibiting the killing of does, and great quantities of trout are slaughtered with giant powder cartridges. This vandalism is all the more culpable as it is chiefly practiced by residents of the county, who, as the law was made for their benefit, should do all they can to preserve the game instead of exterminating it." This passage is probably as true now as when it was written, and it will apply to every county in the State. I have seen hundreds of deer slaughtered for their hides in San Luis, Obispo passage is process.

It will apply to every county in the State. I have seen hundreds of deer staughtered for their hides in San Luis, Obispon and Santa Barbara counties, especially in the latter. I have destroyed quali traps in both these counties, also in Alameda, San Joaquin and Sacramento, and I have seen giant powder used in the Merced River, in the Yosemite Valley, by governent officials. These are only a few instances. I have noted them because they came under my personal observation. Sink-boxes, huge guns, night-hunting, inmense flocks of stools, etc., are as yet almost unknown to California hunters, nor will this be used so long as the present supply of game lasts. But when the work of extermination is well under way, and the birds begin to get scarce and wild, these contrivances will soon be introduced, and then—well, about that time I shall clear out and take my vacation in Arizona.

In conclusion, I only wish to say that I have not written these lines in a carping spirit, but merely as a word of warning. It will apply, not alone to California, but to most of the Western and Southwestern States. Verbum sap.

Juris P.

A CAPTIVE RAIL.—ALBANY, N. Y., Jan. 27, 1882.—Mr. H. I. Gardner, of this city, has in his possession a captive rail. It is kept in a cage, and seems to thrive first-rate upon seed, celery and apples, together with plenty of water to drink and to bathe in. It escaped twice by squeezing itself between the wires of the cage, but a netting placed over the wires now confines it securely. The bird was taken Dec. 1, by Mr. Saurhydt, of Catskill, who, from the window of his office, saw it run across the road. It seemed unable to fly, and was easily caught by placing a hat over it. Do you know of rails being kept in captivity? and if so, will you kindly inform us of the methods that were employed to keep them, the food they will best thrive on, etc.—H. B. D.

WEIGHTS FOR SINK-BOAT.—BANGOR, ME.—Can any of your correspondents tell me how most conveniently to weight a sink-boat requiring 200 pounds weight besides the occupant? The boat is built after the plan published by you some months ago, the writer of which then stated that he used four iron decoys of 50 pounds each, which is impracticable in my case, as the boat is to be taken long distances in the woods, and the weights could not be carried. The boat will be used in shallow water, not more than 16 to 18 inches deep, about same depth as boat. I want instruction also as to the modus operandi or getting in and out of sink from another boat, wings, etc., being in the way.—A. B. S.

boat, wings, etc., being in the way.—A. B. S.

THE KISSIMMEE COUNTRY.—Our correspondent "Al Fresco" has told us of the bass fishing to be had on the Kissimmee River, Florida. The following extract from the Jacksouville Union, of Jan. 26, corroborates his statements—or would corroborate them if they needed any additional evidence, which "Al Fresco's" statements never do:

Colonel Corpell, General Superintendent of the Okcehobee Drainage Company, who has just returned from Kissimmee City, on Lake Tohopekaliga, relates the following incident which cane under his observation, while at the new settlement. One merning A. W. W. Bryan, J. M. Depew, C. S. Edwards, and David Mahone, four workmen, mechanics from Jacksonville, employed on the construction of the dredge and tender, took a small boat and started down Kissimmee River on a fishing expedition. They were absent about two hours, and while landing were asked by the Colonel "what

had brought them back so quickly?" "Why, Colonel," was the reply, "we didn't want to sink the boat." What do you mean?" "Just look here and you will see," at the same time lifting a sail that concealed a luge pile of trout or black bass. On being weighed the spoils amounted to 367 pounds, good measure. While two of the men paddled the other two were trolling with spinners, with the result mentioned. No bait, dead or alive, was used. Some of the specimens captured weighed fifteen pounds each. Wild ducks are mimerous upon the lake, and deer, wild turkeys and other game are abundant.

THE MICHIGAN ASSOCIATION-II.

MORNING SESSION, WEDNESDAY, JAN. 18.

MONNING SESSION, WEDNESDAY, JAN. 18.

MEETING called to order by the President, and minutes of last meeting read and approved. The following gentlemen were elected individual members of the association: E. D. Richmond and L. G. Rutherford, Hart, John Davidson, Monroe, C. C. Fitzburgh, Bay City; Charles Jacobson, St. Charles, H. D. Wilber, Howell, A. H. Mershon, R. H. H. Weidman, W. W. Wicker, A. K. Penny, V. Kindler, Leander Lee, D. R. Brown, John Welch and C. Stuart Draper, East Saginaw.

The special committee appointed at the last annual meeting to consider the proposition of Mr. Boise, of Hudson, to establish an acclimating aviary and game preserve for colin or quail upon his farm, reported as follows:

or quait upon his farm, reported as follows:

To the Michigan Sportsmen's Association:
GENTLEMEN—Your committee on game preserves, after a fair and impartial canvas of the benefits arising from a game preserve as proposed by Mr. Boise, of Hudson, are well satisfied that the proposition is one worthy of due consideration by this association. Before we can take action upon it, it will be necessary to make some provision to defray the expense of the same, and we would therefore recommend that the proposition of Mr. Boise be received and placed on file for the future action of the association.

All of which is respectfully submitted,
C. W. Highy, Chairman.

Mr. Higby stated that a committee consisting of President Holmes, Prof. Roney and himself met at Hudson to consider the proposition made by Mr. Boise; looked over the ground and heard his statement of the advantages of the situation,

and heard his statement of the advantages of the situation, etc. Mr. Boise proposed to receive and properly care for, during the winter, several thousand colin, if the association or its local clubs would furnish the birds, returning to each club their quota of birds in the spring, to be freed in their respective localities.

Plans for suitable buildings had been examined and approved, but the funds necessary for their crection—about \$500—were wanting. The committee considered the plan a most important one, and recommended its adoption as soon as the necessary funds could be raised. The report was received, and on motion the committee were continued in office another year.

other year. The following interesting article, by Superintendent Portman, was then read by the secretary

MICHIGAN FISH AND FISHERIES.

MICHIGAN FISH AND FISHERIES.

Mr. President and Members of the Association.

I hardly understand the limit of my power or duty in this paper. I had shrunk, in some way, in dimensions, so that your worthly secretary falled to find me in the distribution of last year's minutes, and but for the eagle-eyed man who occupies the chair, and scans with closest scrutiny all the machinery of this most excellent organization, the time of this meeting would have passed by me unknown. Even his letter came to my hand at a very late date, when suffering under an attack of severe and sudden heart derangement. I can therefore give you but a few thoughts upon this important subject.

PROTECTIVE LAWS.

PROTECTIVE LAWS.

Are the fish and game interests of the State of sufficient magnitude to demand protection better than we now have By consulting the different statutes now in force, it would seem that they cover with but slight exception all the legislation required upon this subject. I say, with slight exception, for it will readily be admitted that some of our legislation is still imperfect; that we need a modification of existing statutes. These will be referred to farther on. But to the previous question. A glance at the fish interests of this commonwealth, their magnitude is greatly underrated and overlooked. According to the federal census of ISSO Michigan had nearly 2,000 men employed, with 24 tugs, 460 vessels and hoats, with an investment in nets and accessories valued at \$752,150. The product for IS79 was 24,013,100, having a commercial value of \$811,605. Of the catch of the same year it is estimated that 16,000,000, having a value of \$406,000, were sold while fresh, and must have entered largely into home consumption. Over this interest, which is local, there can be no question, it appears to me, as to State jurisdiction. If such question does exist the chooses our legislature to devies some method for its adjudication, for it would be irredeemable folly to allow it to be the sport of circumstances combined with man's avariciousness.

But what of the inland waters where no question of jurisdic-

ist it behooves our legislature to devise some method for its adjudication, for it would be irredeemable folly to allow it to be the sport of circumstances combined with man's avariciousness.

But what of the inland waters where no question of jurisdiction can be raised? Of these there are 5,178 lakes, having an area of 712,864 acres, to say nothing of the innumerable network of streams which form the sources of our beautiful shining rivers. Not a rivulet, brook, river or lake is capable of furnishing fish life and growth of some variety when properly understood and placed under culture, protected by restrictive law. Suppose each of the above lakes capable, in a state of nature, to yield on an average 150 pounds of food fish annually, we will have a product of 775,959 pounds, which at 5 cents per pound would give the nice little sum of \$88,707.50. But will they not, do they not, yield three or even four times that amount? I contend they do, and would be glad if some plan could be devised for obtaining accurate statistics upon this point. There are in addition to the above lakes which were meandered by the United States survey, perhaps 2,000 which lie within the section lines and were not seen by the original surveyors. Not even an approximate figure can be made of the quantity of the fish taken from the rivers and streams of the State, but it reaches no inconsiderable amount.

It must be seen, therefore, that this "water farm of the people" occupied no small place in furnishing food for the masses. But if I mistake not, it will, in the next ten years, under the stimulus of wise and judicious culture, produce ten, yes, twenty times over its present quantity. The introduction of the German or Leather Caap (Cyprimus Carpia), to which the Board of Fish Commissioners are turning their attention, will aid largely in bringing about the result.

Now, is it asking too much of "the powers that be," a provision of law, with methods tor its inforcement, to furnish ample protection to all the necessary parts of this "water

egg. To spear, net, seine or hook them at that age, is to destroy the entire work and cost of their planting.

The same, in a measure, is true with the Angerilla. So far as can be learned, they do not reproduce until the third year of their growth, and yet they attain a size which invites their destruction by the spearman. I say emphatically, prohibit the use of the barbarous instrument entirely, and let all the people say, Amen! The law passed lest winter prohibiting the catching of grayling (Thymalis Tricolor) and spekled trout (Salmo Fonlainatis) under six inches in length, and which comes in force next spring, is still defective. Here at the hatchery the trout planted in the stream in April, 1890, had attained a growth of eight and ten inches, and yet had not produced a single egg. It must be apparent from this that nearly all the trout of six inches in length are young fish of one year's growth, and have never spawned. To take them from the public waters at that ago and size is a waste and destruction.

But with the best laws no protection can be secured from a lawless class, who will kill and destroy game and fish without any motive save that of gratifying a morbid pleasure.

Now, are not these interests of sufficient magnitude to justify the appointment of proper officers to look to the enforcement of all protective measures? And if such officers cannot be secured by legislation cannot some method of associated action be taken through which the different game and fish associations of the State may jointly sustain a system reaching the same result!

Upon the question of game protection, let those speak who have time and opportunity beyond my own to give it.

Respectfully submitted, Jas. G. Portman.

S. E. Rogers submitted a recommendation for the division of the president's address as follows:

1. That such portion of the address relating to the desired amendments to our game and fish laws be referred to the standing committee on laws for the protection of game animals of fur, fin and feather.

2. That su

and trespass laws.

4. That the portion referring to the employment of a State missionary to serve the interests of the association throughout the State for six months or a year, until such time as we can secure the appointment of a game warden by the State, be referred to a special committee of three, with instructions to report a plan for raising the necessary funds for such purpose.

report a plan for raising the necessary amount pourpose.

Adopted, and the several sections referred as recommended, the special committee appointed on subject No. 2 being Messrs. Richmond, Gould and Gillman, and that on subject No. 4, Messrs. Rogers, Cate and Birney.

The committee on the enforcement of game laws presented their report, which after being read and discussed, was referred back for further amendment and to be again read at the afternoon session.

their report, which after owing read and unsussay, read at the afternoon session.

Several standing committees appointed a year ago having no reports to make, the president at this point administered a good-natured lecture to the committees for their delinquencies, holding that it was their duty to come to the annual meetings fully prepared with a report to make, even if brief, so that business might be expedited and made still more interesting. The deserved reproof was taken in good part and a vote of thanks returned.

Mr. Clark thought that everyone should read an article or essay of some kind, as he considered the discussions which followed them the most profitable feature of the convention.

The secretary read the following paper by Fish Commissioner Miller, of Richland, Mich, on the introduction of European carp into American waters, and especially those of Michigan by the U. S. Fish Commission.

sioner Miller, of Richland, Mich., on the introduction of European carp into American waters, and especially those of Michigan by the U. S. Fish Commission.

THE GULITYATION OF CARP.

In the United States report on fish and fishing for the year 1572-3. Prof. Baird first called the attention of the public toward the introduction of the European carp. "In the fact of the great advantage this fish possessed over most of our American species, of its being a vegetable feeder, and adapted to shallow waters, where other fish cannot live.

He also says in regard to the edible qualities of this fish, "It is a great mistake to compare the flesh with our ordinary fish—auch as suckers, chub and the like—their flesh being firm, fleky, and in some varieties almost equal to the European tront." His report for 1874-5 briefly states, "Another fish to which it is proposed to devote the efforts of the commission is the European carp, a species eminently calculated for the warmer waters of the country, especially the mill dams and sluggish rivers and ditches of the South. This fish has been domesticated for thousands of versa, and it is one of the species which furnishes the principal rood of the Chinese, living on vegetable matter, instead of animal, it can be multiplied at very little expense in very limited waters."

The professor in his report for 1876-7, after speaking of the introduction of this fish as having been a favorite object for years with the commission, annonnees the gratifying fact of the arrival at New York, May 26th, 1877, of 345 carp of three varieties in charge of Dr. Rudolf Hassel, who was sent by Prof. Baird expressly for them, he having had great experience in carp raising in Germany, and who reports these to be of the choicest varieties known in Europe. As the national carp ponds at Washington are not yet constructed, these fish were temporarily accommodated with a home at Draid Hill, Baltimore, by the fish commissioners of Maryland. In the meantime, upon application of Prof. Baird, Congress gave authority

tailed for the carp, 1,200 were secured, and the greater part planted in small lakes, which were free from predatory fish, in different parts of the State. Arrangements were made by Mr. Miller at Washington for a further shipment by express of 2,000, which arrived at Kalamazoo December 1st in perfect condition, and were placed in the vacant ponds at Pokagon for distribution in the spring, where suitable ponds free from destructive fish are found.

Prof. Baird has also sent this fall to Michigan in charge of Frank N. Clark, Usq., of Northville, Wayne County, an additional 3,000 for distribution, making a total of 6,200 received in the fall of 1881 for the plant of the State.

The paper elicited an interesting discussion as to the relative value of fish as food. President Holmes inquired if any one present knew anything about the carp.

Mr. Clark said he did not breed carp but had some in his ponds. He had seen some in Washington weighing as high as sixteen pounds, and Prof. Baird pronounces them a very fine flavored fish. The fish grew in a sluggish pond formed of water from the Potomac, which was sometimes as warm as 90 degrees, and they were finer cating than any fish in the Fotomac. The earp at Northville weighed \(\frac{3}{2} \) pound when 16 months old, which he considered a slow growth, and attributed it to the cool water, which was seldom warmer than 50 degrees, and believed that in water at 80 and 85 degrees they would grow rapidly. Mr. Clark's remarks also elicited the facts that there are now at the United States Fish Hatchery at Northville, Mich, ish and eggs as follows:

Brook trout eggs.

allifornia trout two years old. 3,000
rook trout eggs 20,0,0,0
littlefish eggs 22,5,0,0,0
allifornia trout eggs, there are expected by May 1 to be 50,00

California trout eggs, there are expected by May 1 to be.... 55,000 President Holmes said he made the inquiry because considerable was being said in favor of the European carp, and we do not want our waters occupied with anything that is not an inprovement over what we have that will live in the same waters. Mr. Miller's testimony was general. Inasmuch as the Potomac contained the black bass, he considered Prof. Baird's praise of the carp very high commendation.

In answer to a question the treasurer reported eighty-nine individual members and sixteen clubs belonging to the State Association.

andividual members and states that a standard and Association of a national sportsmen's association was discussed and generally favored.

Mr. Gillman thought the plan a very desirable one and suggested that the secretary correspond with the officers of other state associations with a view of bringing the matter to a

ocus. Secretary Mershon then read his report as follows:

gested that the secretary correspond with the officers of other State associations with a view of bringing the matter to a focus.

Secretary Mershon then read his report as follows:

Mr. President and Gentlemen of the Michigan Sportsmen's Association:

I beg leave to make the following brief report of the work of the association during the past year, and also congratulate the members on the splendid results accruing from our efforts, toward game protection. Regarding the publication and distribution of our fourth annual book I will say little, leaving it to friend Roney, chairman of the publishing committee, to say what it cost and where it went. I will say this, however, that the press work and paper is of a poorer grade than we expected to get when we contracted with the printer. Nevertheless it has undoubtedly fulfilled its mission of good work tully as well as though it was printed in gill letters on the finest of tinted paper.

Your secretary has received dozens of letters asking questions on as many subjects, all of which have been replied to. He has frequently received letters from individuals or secretaries of so-called game protection chubs asking whether he could secure them a supply of live wild pigeons for their trap shoots. We have invariably replied that they were very much mistaken in the party, and that personally we considered pigeon shooting from traps as unsportsmanlike.

We have repeatedly received letters containing seemincly positive information regarding illegal killing of deer and other game, but were obliged to do nothing, not so much from lack of funds as from lack of time to attend to the prosecution attorneys seem to be very indifferent and take no pains to punish offenders, even after information is lodged against them. Soft is necessary, in order to bring a case to trial (I don't say convictionifor some one to spend a great deal of time where the offence has taken place. Now, none of us have that time to spare, and if we had it would be a few doing all the work. The only way out of

game laws?"

W. B. Mershon, Secretary.

The bills of the president and publishing committee for postage, etc., were allowed and ordered paid, and the meeting adjourned until 2 P. M.

WEDNESDAY AFTERNOON SESSION.

Meeting called to order by the president at 2 P. M. Minutes of the morning session read and approved.

The committee appointed at the morning session on a State missionary and game warden reported through their chairman is follows:

REPORT ON STATE MISSIONARY AND GAME WARDEN.
To the Officers and Members of the State Sportsmen's Associa-

To the Officers and Members of the State Sportsmen's Association:

Your committee, to whom was referred that portion of the president's address relating to the employment of a missionary or protective agent of the association, and to devise a plan for the remuneration of his services, would respectfully report that they have fully considered the subject and heartily coincide in the suggestions made by the president. They would therefore recommend that the executive committee of this association be authorized to employ as may be, immediately, if possible, a suitable person, who shall be a member of this association, as a State association protective agent, whose duty it shall be to visit every county in the State, organize clubs, set forth the true aims and objects of the association, as the president very apply says, "Give light to the Gentiles," and especially to see that the laws are enforced, by moral suasion when possible, by vigorous proscention when necessary. This missionary or agent to be engaged for one year, to be required to communicate from time to time with the officers of the

association for direction or advice, and to make a full report of his doings at the next annual meeting.

We also recommend that a fund be raised to be called the protective fund, to pay the salary and defray the traveling expenses of the agent and such necessary prosecutions as may be instituted against offenders, by means of collections, of voluntary contributions forwarded to the secretary by a member from each club to be appointed by the executive committee; any deficiencies to be made up by direct assessments levied upon the auxilitary clubs and individual members, and any surplus to remain in the freasury as a sinking fund for the expense of enforcement of the laws and protection of game and fish.

any surplus to remain in the freasury as a small any surplus to remain in the freasury as a small capture of experse of enforcement of the laws and protection of game and fish.

We also recommend that standing committee No. 1, on laws for the protection of game animals of fur, fin and feather, be instructed to prepare a memorial and petition to the State Legislature of 1853, for the appointment of a State game warden, and an appropriation for his salary and expenses and asking that power be conferred on him to designate some member of the constabulary in each county as special game constable, who shall attend especially to prosecutions for violations of the game laws, and receive the fees provided by the statute for such services.

By kindly and judicious, but vigorous measures such as these, your committee firmly believe can only be made effective by the good work which this association has labored seven long years to perfect.

All of which is respectfully submitted,

S. E. Rogers, C. W. Catte,
R. J. Binney.

S. E. ROGERS, C. W. CATE, R. J. BIRNEY.

Mr. Rogers, in presenting the report, said the committee considered that the measure recommended one of the most important ever considered by the association, and asked for a free expression of views on the subject. The committee considered vigorous measures necessary, and regarded this the only effective method of enforcing the laws. Scoretary Mershon called attention to the fact that by the report, only a member of the State association could fill the office of State game warden, and they might not be fortunate enough to find a man in the association who could devote his time to that object.

Prof. Roney remarked that when the proper person for that office was found, it would cost him only \$100 to join the association.

The president suggested that the length of time for which a

iation.

The president suggested that the length of time for which a tate warden should be employed should be left discretionery ith the committe, to be governed by the amount of funds itself.

State warden should be employed should be left discretionery with the committe, to be governed by the amount of funds raised.

Mr. Rogers thought a game warden was needed every month in the year; that violations were doubtless now taking place daily, and he believed the fraternity throughout the State would raise the necessery funds, and if that was not sufficent, the auxiliary clubs and individual members should be assessed. What was open senson for fish was close season for game, vice rersa, and the game and fish interests would demand the entire time of the game warden. He thought the amount of compensation should be left with the executive committee, but believed a competent man could not be obtained for a year for less than \$1,000.

Mr. Greenwood suggested that this would be less than \$100 for each club, and thought it would be better to hire a man for six months, or even three months, than not at all.

Mr. Gillman thought that if such an agent was employed, he should be a thoroughly efficient man, one with the interests of the association and its protegés, the game birds, animals and fish, foremost in his mind, and one capable of working upon interest in the associations work, of organizing clubs, etc. He thought a man with all the necessary qualifications could not be secured for less than \$1,800 or \$2,000 a year; including traveling expenses

topics:
The Workings of the New Game Law, and other topics.
Gentlemen of the Michigan Sportsmen's Association.
It was my intention to again present for your consideration my annual installment of statistics concerning the destruction of deer in this State the past season, but my absence in foreign lands during the entire summer, and an extraordinary pressure of business since my return, has made the compilation of a statistical report an impossibility. I desired to do this to show the workings of the new game and non-export law, which I believe in the main has been satisfactory, and has proved of practical value beyond the expectations of the most sanguine originators. From my own observations, combined with the opinions I have obtained of many gentlemen well qualified to speak, I fully believe that the shortening of the season, the clause prohibiting the killing in water, and "having in possession" the skins of deer, and, more than all, the non-export law, have reduced the annual slaughter of deer from 70,000 in 1880. This includes deer destroyed for all purposes during the year—a grand showing truly. To the warm weather and open, rainy season may be attributed a certain portion of the reduction, but it is in the main due to the changes in the law above mentioned. This gives cause for mutual congratulation that our years of effort against coldness and discouragements to provide a law that would perpetuate our game and fish supply have been at last crowned with such signal success.

One object of this meeting should be to take measures look-

game and fish supply have been at last crowined with such signal success.

One object of this meeting should be to take measures looking to the better enforcement of the present law, particularly the clause prohibiting the shipment of game from the State. Many reports have reached me complaining of the violation of the non-export law at Ludington, Port Huron and Detroit, and, as a rule, they appear to be well grounded. The shipment of boxed venion billed as "increbandise," "pork," etc., to towns in other States from inland railroad stations, are also authoritively reported.

to towns in other States from inland railroad stations, are also authoritively reported:

I would also call the attention of the association to the necessity of immediate action to rid our cities and villages of that imported pest, the English sparrow. Once believed to be a valuable insectiverous bird, it has been proven beyond question by the published reports of park keepers and public gardeners of Boston, New York, Baltimore, Louisville and other cities, and well-known scientists, that they are utterly valueless as insectiverous birds, and antagonistic to our recognized song birds. My own observations for the past ten years

in the city of East Saginaw convince me that the present great scarcity of song and insectiverous birds in this city, such as robins, blue birds, yellow birds, wrens, martins, etc., is due to the great increase and aggressive tactics of their hardy and pugnacious little enemies, the English sparrow. I am in favor of a law offering a bonuty on the heads of these little street scavengers, and a law permitting them to be shot from the trap, believing their externmentian a necessity on the ground that they are nothing more or less than vermin, and implactable enemies of our valuable song and insectiverous birds. In some of the Eastern States, and also in England, bounties are now being paid on the heads of the English sparrows. The Ising bird should also be made to accompany the sparrow. Officer suggestions occur to me, which I have not time to put in writing.

Ising bird should also on the control of the suggestions occur to me, which I have not time to put in writing.

In concluding I desire to express my regret at not seeing in this convention the faces of our veteren co-workers, Judge Holmes and Mr. Collins, of Bay City, Mr. Colburn, of Detroit, Mayor Michols, of Battle Creek, Judge Shaw, of Eaton Rapids, Congressional Lord, of Detroit, Supl. Portnau and Missers, Kellogg and Miller of the Fish Commission and others, all unavoidably described from meeting with us this year. Their valued commed and lovel-headed opinions, which have contributed so much to the general interest and effectiveness of this association in former meetings, is seriously missed by us, and we include the hopothat the next meeting may find them in their respective places in our ranks.

Very respectfully, H. B. Roney.

East Faginaw, Mich., Jan 18, 1882.

Mr. Highy read the following on the subject of

East Faginaw, Mich., Jan. 18, 182.

Mr. Higly read the following on the subject of

A STATE GAME WARDEN AND OTHER MATTERS.

Mr. President and Gentlemen of the Association:

The members of this association have expended not only a large amount of money but much valuable time and thought in preparing and presenting the various amendments that have been made to our game, fish and frespass laws, during its lifetime. A constant agitation of the importance of more efficient and stringent protection to game and fish is necessary. Year after year we have met for work in our legislative halls, and we should continue to do so. Our efforts have finally been crowned with success at the last session of that honorable body.

"Truth is mighty and will prevail," and it has prevailed. In proof of this, allow me to quote from the report of our worthy ex-secretary. Prof. Roncy, for 1881:

"From a small beginning the Michigan's Sportsmen Association has grown to be an acknowledged State institution, respected and commended for its spirit of humanity, friendship and protection toward our game animals, birds and fishes; while its sincerity of purpose is no longer doubted. From friends and strangers in the East, West, North and South, have come voluntary words of praise and encouragement for the good that is being accomplished, and the faithful manner in which this association lives up to its professions and the purposes of its organizations."

What better evidence can we produce than to be true to our preterious and purposes.

We cannot well do otherwise than to enforce the present law. If it is worth enforcing at all it is worth enforcing to its full extent. (there country to the contrary notwithstanding). Allow me a repetition. This is the point from which radiates the integrity, honest pretensions and purposes of this association. It becomes our duty to see that primary measures are laken at the present nexting to enforce up rame laws, and near relinguish our efforts until we secure such respect them as integrity. In the proposal

received. In my opinion, the best system to be adopted by us is the warden system. It seems to me, gentlemen, in considering the field of labor that unst of necessity grow out of the attempt to enforce the law, that there must be some one at the helm who can set his compass and take his bearings. The office or State game warden should be an independent one, with salary sufficient to make it effective. The officer should have power to appoint one or more deputies in every county in the State, and to remove the same for disability or incompations.

in the State, and to remove the same to the protoney.

I see no good reason why the office of State game warden could not be self-sustaining, if only one-third of the fines were collected of the thousands of riolations that are committed yearly. In conversation with a menaber of the Board of Directors of the N. Y. Sportsmen's Association, he assured me that the warlen system had a sultury effect upon the game law violators in that State, and he was well satisfied that it is the only measure whereby the law can be successfully carried out.

C. W. Hoddy.

The committee on enforcement then made the following

the only measure whereby the law can be successfully carried out.

The committee on enforcement then made the following report:

The committee on enforcement then made the following report:

To the Officers and Members of the State Sportsmen's Association:

Your committee on enforcement of game, fish and trespass laws to winch may recommitted their report, and to whom was referred that portion of the president's address so tersely and significantly propounding the problem, "How may we best seeme respect for and obedience to the laws?" would respectfully submit the following report:

Laws of all kinds are made to be obeyed. Those enacted for the preservation of game and fish are no exception; but while all others have proper officers appointed to enforce them, those last named seem to be almost a dead letter upon the statute book. While it is made the duty of the prosecuting attorney to take cognizance of complaints and prosecutiviolators, the chief labor devolves upon the complainant, who is to assume the furnishing of the necessary evidence, and he courts the enmity of nearly the whole neighborhood in which the offense is committed.

These facts make it very difficult to thoroughly enforce the observance of the game and fish laws.

It becomes the duty of the committee to carefully consider these facts and their attendant circumstances, and devise ways and means to best administer the laws to their faithful observance.

Your conneitice would suggest and recommend that a fund be raised and placed with the treasurer of your State association, to be expended in rewards for convictions of violators, to be point on the complainant in each case when conviction and enforcement of the penalty follow. The necessary fund to be rafeed by the assessment of \$10 upon each club who are members of your association, with such additions as may be made by voluntary subscriptions. We advise that circulars be sent to those throughout the State who would be likely to respond, and leand tills be posted in numerous places wherever the

ever the State.
We further advise that in offering the rewards that it, be

understood and so expressed, that no settler or homesteader who only kills game occasionally for his own use in his family shall be prosecuted, and the reward does not apply to their cases. But in no case shall innumity be granted to any one to kill or capture deer upon snow-crusts, or who catches trout or other fish by any means upon their spawning grounds, or trout or grayling in any otherway than by hook and line. All of which is respectfully submitted. Crusts W. Hugay

CYRUS W. HIGBY,

other fish by any means upon their spawning grounds, or trout or grayling in any other way than by hook and line.

All of which is respectfully submitted.

Mershox, R. J. Brewey, G. G. Greenwood, G. G. Greenwood, R. J. Brewey, G. Greenwood, G. G. Greenwood, R. J. Greenwood, G. G. Greenwood, G. Greenwood, G. Greenwood, G. Greenwood, G. Greenwood, G. Gre

reams.
President Holmes thought if the word "shooting" were subinted for "killing or enjuturing" it would be sufficient.
Mr. Gillinan was opposed to killing or capturing deer by
us means whatsoever while swimming.
The thanks of the association were tendered the Common
ouncil of East Saginaw for the use of the council room for

Council of East Saginaw for the use of the council room for this meeting.

The treasurer, N. A. Osgood, of Battle Creek, submitted his amual report. Receipts, \$290.57; disbursements, \$69.32; bulance on hand, \$230.25. Report adopted.

Mr. Rogers offered the following resolution: Resolved. That the present standling committee on nomenclature be requested to submit at our next annual meeting, a report on the nomenclature (popular and scientific) of the game fishes that inhabit our waters, supplementary to their previous valuable reports of 1889 and 1814, on field birds, water fowl and game animals. Carried.

ELECTION OF OFFICERS AND PLACE OF NEXT ANNUAL MEETING.

Detroit was chosen by ballot, as the next place of meeting, and the time, the second Tuesday in January, 1883, at 30 P. M.

Detroit was chosen by ballot, as the next place of meeting and the time, the second Tuesday in January, 1883, at 739 P. M. retiring officers, viz: Dr. E. S. Holmes, Grand Rapids, President; W. B. Mershon, East Saginaw, Secretary; N. A. Osgood, Battle Creek, Treasurer, and W. C. Colburn, Detroit, Directon, for four years, were unanimously re-elected. The thanks of the association were extended to the officers for their faithful services the past year.

Prof. Roney offered the following resolution:

Resolved, That this association recommends the extermination of the English sparrow and the striking out of the word "sparrow" in section 7 of the laws protecting insectivorous and song birds, on the grounds that it is not an insectivorous bird and is of no value to the farmer and horiteulturiet, but a great injury, feeding as it does on growing grain, as well as decayed vegetable matter and stroct sweepings, instead of on noxious insects; that it is pugnacious and aggressive with other birds, and wages perpetual warfare upon and drives away our feathered songsters and insectivorous birds.

Resolved, That this association recommends auxiliary clubs to offer a bounty of 25 cents a dozen on English sparrows, dead or alive, as soon as the law now protecting them is so amended as to legally permit it.

The sparrow question was thoroughly discussed by the members. President Holmes, Mr. Gilhuan and others tully indorsed the resolution. Mr. Regers dissented; was a friend to the birds and liked to see them around.

The first resolution was then unanimously adopted, and the second referred to the executive committee.

Prof. Roney offered a resolution that the association should urge its auxiliary clubs to use their influence among their membership and all interested to increase the circulation of those sterling journals, Fonest And Stream and others, as important helps to all game protective clubs in forming and fostering a public sentiment in favor of the protection of ame and fish. Carried.

Mr. A. H. Mershon called attentio

own. John Sharp, an old fisherman of Bay City, corroborated

Mr. John Sharp, an old fisherman of Bay City, corroborated Mr. Mershon's statement. He said that fix or seven men had set their nets at the mouth of the river, and explained that the nets start from each side and tuo nearly across and are but a few rods apart, and they stopped nearly every fish. Ho asked for advice in the mattey.

Mr. Koeney quozed the law of 1801 as follows: "Whoever obstructs the main channel of any river or creek, by placing therein nets or lishing appearatus of any kind whatever for the purpose of taking or stopping fish of any kind, shall thereby incur for each oftence a fine not exceeding \$250; and in no case shall the said channel so loft open be less than one third of the whole breadth of the river."

Mr. Rutherford, of Hart, was called upon for a paper which the had prepared and which he then read, prefacing it with a ew pleasant remarks.

BROOK TROUT IN OCEANA COUNTY.

Last year I hurriedly wrote upon the subject of "Brook Trout in Oceana County," more than anything clse to show that it was not essential to the growth and development of those fish most prized by the sportsman and epicure that they be planted by nature in the waters where they are found.

Inst. year I hurriedly was to upon the subject of "Proots Trout in Oceana Constly" more him anything else to show that it was not essential to the growth and development of those fish most prized by the sportsman and epicire that they be planted by mature in the waters where they are found.

How many men are there in Michigan who now and then pause in the whirl of business and in delightful reverie, go back among the rugged hills of New England, New York and the proof of the overland of the elsewhere they are found.

How many men are there in Michigan who now and then pause in the whirl of business and in delightful reverie, go back among the rugged hills of New England, New York and the proof of the overlanging boulds of the somewhere here lock before it again went plunging down, down, down on its course to the quiet sunfil meadows below.

How we laugh at ourselves when we think of the boy armed with a birel rod cut on the banks of the stream, one of its secured enough of the cerebral denizens of that brook to excite the enough of the cerebral denizens of that brook to excite the enough of the cerebral denizens of that brook to excite the enough of the cerebral denizens of that brook to excite the theory of any true sportsman.

I see him now as he stealthily approaches a bend in the Stream. How well he knows where the trout love to lie, his sunburnt face fairly sparkling with anticipation as he pusies back the old straw hat and lengthers his neck to see just the help of the theory which he had accountly induced the hearth of the torn and bleeding toe which he now carefully ruises to a position where he is sure of a firm foothold. Now look: he has run a "speckled beauty" disk across the hole! One moment of cestacy—all depends upon his tact, and he would rather lose a coal mine—aye, all the saw mills in the Saginaw valley are nothing when compared with the fish.

How the proof of the proof of the proof of the hearth of the hole of the hearth o

what that should be we will consider in another paper.

Mr. Rutherford supplemented his paper by a few remarks, in which he stated that the trout in Oceana county which they planted four years ago were now fourteen to sixteen inches in length. Two years ago the State fish commission furnished them 10,000 more, and their streams now teem with brook trout. There is no streem north of Grand River which is fed by brooks that is not admirably adapted to the raising of brook trout. No man ever caught one who did not want to eatch another. No man ever fished one season who did not want to go again, and I know of no better streams filled with this delicious food than the streams of northern Michigan. Some of you may doubt the assertion I have made, but to prove its truthfulness I want to extend to you, Mr. President, and to every gentleman of this association, in behalf of the association to which I belong, namely the Hart Sportsen's Chib, an invitation, when the law expires, for each and every one of you to come and prove it for yourselves. And remember that the latchstring of that club hangs on the outside of the door, We are always ready, and not only ready but happy, to welcome every true sportsman, for when we do we meet a gentleman. (Applause.)

Prof. Roney introduced Hon. John Welch, Mayor of East Saginaw, as the fourth Mayor of prominent Michigan cities to be found in the ranks of the association. Mr. Welch made a few remarks congratulating the association on the grand work it was accomplishing, and assuring those present of his hearty sympathy in the cause. His remarks were heartily chered.

On motion, the Convention then adjourned to meet at Detroit. Jan. 9. 1881, at 7:20 p. at

cheered.

On motion, the Convention then adjourned to meet at Detroit, Jan. 9, 1883, at 7:30 p. M.

The East Saginaw Game Protection Club had funds raised for the purpose of giving the delegates to the State Association a banquet, but learning that nearly the entire delegation yould leave on the 6:30 trains, the project has been aban

doned.

In conclusion, your correspondent cannot better describe the spirit and kindly feeling of the meeting than to quote the following from the daily Herald of this city:

"The closing scenes in the convention were marked by more than the usual formality of mere leave taking, and the true fraternal relation existing between brother sportsmen was in every word and action. It is doubtful if over before a gathering of men has held in this or any other city where less acrimony of feeling or difference in views has been manifested than in the convention which has just closed. In the two days' debate not one harsh word or cutting sarcasm was heard. The object of the association scenned to thoroughly pervade every speaker and tone every paper from first to less. The breakers of the game laws will find they have no despicable foe to grapple with in the State Sportsuen's Association of Michigan, for its membersign is a closely united unit. Mayor Welch, at the closing movements of the convention, came in and gave the members good words of cheer in the prosecution of their noble work. He expressed himself as being fully in sympathy with the objects of the association. These gentlemen have come among us quietly and as quietly left us, but the impression they leave behind will be a permanent one, and one in its wide-spread influence which will be a permanent one, and one in its wide-spread influence which will findly revolutionize the present system of indiscriminate slangther going on until the forests of Michigan."

Extra Sagixa, Mich.

Editor Forest and Stream:

Editor Forest and Stream: Editor Forest and Stream:
In your lass issue, in the report of the meeting of the Michigan Sportsmen's Association, held in this city, by a slight error I am reported as desiring the words "while swimming" stricken out of the present law relating to the killing of deer, whereas I desired them inserted for the reasons mentioned in the same connection. By a singular coincidence, my position was similarly reported in your columns a year ago in connection with our annual meeting at Lunsing. By kindly inserting this you will explain a seeming inconsistency and confer a favor upon, Very truly yours, H. B. ROMEY.

Sea and River Hishing.

"And shall you never come back?" she said. And stant you never come back? she said.
Where she stood by his side in the porch rose-covered—
Up in the jasmine over her head
A peacock butterfly poised and hovered.

And ever through hush of the languid noon. They heard like the beat of a ceaseless time.

The mill-wheel plashing, droning, turning,

—THE MILL-WHEEL, by May Probya.

A HAT FULL OF TROUT.

A HAT FULL OF TROUT.

A HAT FULL OF TROUT.

A Hot Sulphur Springs, Colorado, and having a grand time hunting, fishing, climbing the mountains, and storing health and happiness for years to come. One morning Lew determined to take his pony and go in quest of rare minerals, of which he was making a collection, and I concluded to gather in some trout. Though we had flies we used grass hoppers for beit, picking them off the bushes and the grass in the early morning when they were stiff with cold, and stringing them on a thread by means of a necelle.

Having obtained a supply, I went to a point a mile up stream where there was a succession of little falls. Finding it would be difficult to stand in the swift current, where the line could be well managed, and the bait thrown to attractive spots, I succeeded, after much labor, in getting a large pine log rolled into the river, and against a lunge rock, just above one of the rapids below which there were pools of deep water. A little wading was necessary to reach the log, but once out there was dry footing.

The first cast was signal for excellent sport. A nimble swinner took the lure and went off with much spirit, but soon returned to my feet, and surrendered. Weight, three-quarters of a pound. The second cast brought in his materiand, one after another, six of the same size were landed. Then I changed my position, going to the further end of the log, where my weight and the pulsating current made it disagreeably unsteady. But, you know how it is, the spice of adventure, the keen sport, and all that, give one a feeling that only a ducking or some such disaster can cheek.

Presto! this was the place for Sir Humphrey Davy, or any other man who loved sport. Getting ready to throw the hooks, the rod, in my effort to maintain equilibrium, dipped, and the bait dangled on the water and not stopping to catch bis breath until he had run off one hundred and twenty-five feet of line. Then he turned and went into an eddy to the right, giving back twenty feet of the line, which wer

when again he shook his head and telegraphed defiance along the line of communication.

I thought, at this turn of affairs, it would be very difficult to land him out there on the log, and determined to get carefully on shore. While endeavoring to walk the now shippery log, and keep the trout in hand, my foot slipped, and—I went into ice cold water up to my waist. At the same time my hat got off and started on a voyage by itself down toward the grand canyon of the Colorado. A friendly branch from the log enabled me to keep perpendicular, and somehow I managed to get out, my boots full of water, and my ardor and clothes much dampened. But the fish was on yet, and in a few minutes I had him in hand. He weighed two and three-quarter pounds, and was the largest we caught in that locality.

two and three-quarter pounds, and was the largest we caught in that locality.

Having secured the fish, the next object of thoughtful effort was to catch the hat. It was a serious matter to lose that very important article of apparel. There was not a bat store, junk shop, nor corner grocery within sixty miles, and it was a poor place to borrow. A wolf-skin cap might have been constructed; but first an attempt to capture the old and familiar article was in order.

By the time I got to shore and had the trout in my hunting-coat pocket, the hat was a quarter of a mile away, bobbing about riotously, and apparently having a nice time. Rod in hand I started in pursuit, and overtaking the truant, threw the line, on which I had quickly put a split bullet, to fasten it somehow and draw it in. But it was no easy task, and the chase was kept up a long distance. Finally the line dropped just above the hat, and bightening carefully I succeeded in making it fast. Then came the cautious trial of lowing the thing ashore, when, to my consternation,

something jerked. The line became taut, the hat assumed the appearance of a battered hour-glass, and I recognized a sneak-thie on the other side, a lively salmon-trout, disputing possession, having snapped up one of the hoppers, as the man did the rope that had a calf to it, though perhaps without the same felonions intent.

Here was an emergency I had not anticipated. The frightened fish dashed about with the usual vigor, the hat going under at times, and bobbing up, and gyrating in comical fashion; the line fightened and slacked, and the reel fairly smoked with friction. I wanted the furniture more than the fish, and would have compromised by giving him his freedom; but he manifested no concillatory feeling. A few rods from the exit of the hot spring water from the mountain-side is a stretch of white sandy shore which I was rapidly nearing, and here at last I got fish and hat to land, the outfit weighing at least five pounds, hat and all.

As much like a fish-story as this may seem, it is no exaggeration, though of course you will have to take my word for it.

It is unnecessary to tell how and where and by what mancuvers the rest of the morning's complement was caught.

By ten o'clock I had twenty-two trout, of full weight, and
feeling satisfied for the nonce, pulled my hat firmly on my
head, and went back to camp.

JEROME BURNETT.

MOONLIGHT ON THE LAKE.

Why is the moon like a sword? Because it is the glory of the (k)night.

Why is the moon like a sword?

Because it is the glory of the (kmight.)

LET us turn again to nature for the verification of the above. We left the lake to the gathering darkness, the same unrufiled calm possesses it still, and as we near its margin we see the cool, crisp brilliancy of the stars reflected from its face, seeming as though it held them in itself, and that their silver gleams came from its own liquid depths, not from above. Lighting a cigar and finding a comfortable seat on the gnarled and curling roots of an old cedar, we are prepared for this, our second, communion with our Creator's works. Why is it that we feel awed and impressed as we gliding majestically on and on to eternity? The plaintive calls of the loons cause a momentary sadness to come over us, soon dispelled, however, by the changes constantly going on around us. All is hushed as in the splendor of sunset a few hours before, but it is the hush and silence of expectancy, and we involuntarily listen as though about to hear the opening chorus of some grand authem. The starstill gleam in the throbbing water, and as our eyes wander over the mountains reposing in grand shadow-like masses in the distance, Jupiter swings into sight over the far away summits, and throws a pure silver thread across the surface right to our very feet, bringing vividly to our thoughts the Indian maiden, who, long ago, met her faithful chieftain on these shores, under the beams of this same planet, (see Cooper's 'Deerslayer') and as we watch it climbing upward an increasing splendor seems to fill all the atmosphere, growing and broadening in glow, until the full moon, the crowning glory of the night, rolls noiselessly up, paling the stars into softness as she sails along in their midst.

"Soon as the evening shades prevail, The moon takes up the wondrous tale,

"Soon as the evening shades prevail. The moon takes up the wondrous tale, And nightly to the listening earth, Repeats the story of her birth."

The lake is a mass of joyful ripples, which dance and sparkle in the moonlight flooding over all as the soft night wind now stirring breathes upon them. Nature has proved that our answer is true. Do you still doubt her? Question

WHICH WOULD YOU RATHER?

WHICH WOULD YOU RATHER?

THIS one-sided question, "Which would you rather do or go a-fishing," by whom fathered I know not, is very often thrown at me, and the answer invariably is, "Go a-fishing," and so I would. We all have hobbies, have we not? Some folks ride theirs to death. Fishing is mine, but the cares of this world and the pleasure (?) of working on a salary for somebody else keeps me from riding mine so far.

When I was big enough to go to school up in the country where we lived, I soon learned that boys' pockets contained sundry odds and ends—slate pencils, marbles, tops, strings, a jack-knife, and very often a piece of fishing-line, a sinker and a hook. When opportunity offered a split hamboo rod was easily found growing in the woods or alongside the stream. So to get rigged up for fishing was a very simple matter, and many a time I have done it, too. And now that the skating pond on top of my head is very smooth and bare, and my locks whitening with my fifty winters, I find myself just as fond of the genile art as when a boy at school.

But the pleasure I have had with my fishing-line in all those years is a something priceless to me. I can sit on these winter nights and think over companions in the art, adventures sometimes rather scary, mislaps laughable, and withal the keen enjoyment ever fresh and ever new.

One day my friend Jim Reid and I went over to a certain rook on Long Island Sound for blackfish. We sat fishing at a place where the rock rose about four feet above high water, when all at once something gave my line a yank, and before I could think I was overboard. How or why I never knew, but there I was and unable to swim a stroke. As soon as my head came up I grabbed hold of a spur in the rock and stuck there; but poor Jim was acrazy as a loon. He ran a round on that rock as though it was red hot. I stung out to him to pass me the end of his rod and then help me out, but he was too scared to do even that much. However, the rock got cooler and so did he, and finally I was hauled out, ver

with a little belp from Stuart we get him into the boat again. We had quite a mess of fish, but they were biting lively just then, and you know how hard it is to red up your line and give up when things are just so; but this affair put a stopper on the fun, and we all felt that our fishing for that day was done. Poor Sam never wanted to go fishing again.

I had been up in Brown's Tract (Adirondacks) for three weeks, and only a few days remained of my vacation. One day I said to my guide: "John, I want two or three sticks for canes for friends. Suppose we go up to Fourth Lake Stream and cut some." "All right," said John; "take your tackle along and we'll get some trout and some minnows for the boys." So we started out, got a lot of minnows and a few trout, and then handed and cut the canes. John stepped down off the bank into his boat and took his sent, holding the boat alongside a clump of roots from which I was to step into the stern. I placed one foot in all right, but as my second went in the canes caught in the branches of the tree and the boat shot out from me like a flash, and somehody got overboard mighty quick. As my head came up I reached for a root of the tree, shook the water out of my eyes and scrambled up the bank. Then I took a survey. John still sait in his sent with his feet on the gunwales, his boat half full of water, and everything afloat and demoralized. As soon as my breath came I had a good laugh at the affair, and many a time since has the smile come to my face, and John's, too, at the quick passage to the bottom of Fourth Lake Stream.

J. R., Jr.

New York.

Angling for a Rat.—New York, Feb. 8.—Believing that angling items are scarce at this season of the year, I send you the following exciting account told me by the gentleman himself. Mr. E.—, an accomplished and well-known angler of this city, while sitting in the "sanctum" of a fishing tackle dealer the other afternoon calculating how many days before the trout would be at his mercy on Long Island, suddenly noticed the head of a big rat peeping from behind the counter. Hastily rigging a small book on a stout line and putting on a piece of cheese for a "stretcher," Mr. E. proceeded to angle for "Brerr Rat" in the most approved style, and as carefully as if for a two-pounder on the South Side. Presently there was a smart tug. "Tve got him!" shouts Mr. E. "Give him line!" "Wher's the guff?" "Pull him in!" etc., etc., are shouted by the excited lookers on, while with his usual skill and great display of nerve, friend E. plays him until the rat is used up, and following the advice of the FORDST AND STREAM, he kills him with a rat-tailed file.—W. Holderton.

SMELT FISHING IN MAINE.—The Belfast Journal says: "The advance guard of the smelt fishers have pitched their canvas tents on the ice, above the upper bridge, and entice the silvery fish up through holes cut in the ice. On Saturday there were cleven tents, eight single and three double ones. A few fishermen were upon the ice without shelter. The smelt fisher helieves in comfort. Each tent is supplied with a stove, which not only keeps the fisher warm, but supplies him with hot coffee for dinner. A seat is arranged alongside the stove, while at his feet is a yawning hole in the ice through which hang his four lines. About ten pounds per man is an average day's catch."

Salmon Disease in Great Britian.—For the past year or two our English exchanges have been filled at certain seasons with accounts of a disease among salmon. It manifests itself in the form of a fungoid growth which reresembles that often seen upon a fish which has been injured by nets or by handling. This fungus is evidently the effect and not the cause of the disease. We now read in a Scotch paper that "a mysterious disease prevails among the solmon of the Tweed which is decreasing their numbers to an alarming extent. It is estimated that fifty per cent, of the fish are affected. The epidemic is attributed to overcrowding."

A Correction.—Sauk Centre, Minn., Jan. 28, 1893.— Editor Forest and Stream.—Your correspondent at Sauk Centre, Minn., "Dell," states in a recent number of the Forest AND Stream that W. C. Brower fell into the lake-while on a hunt with Long Prairie sportsmen. The statement is wrong in every respect, not one of the party met with a mishap of any kind.—Walter C. Brower.

The Young Idea.—Schoolmistress (just beginning a nice, improving lesson upon minerals to the juniors)—"Now, are the principal things we get out of the earth?" You angler, aged four (confidently)—"Worms,"—Ex.

The Expensive Terrapin.—An item is going the rounds of the papers, that at the recent dinner of the Cuvier Club of Cincinnati, the terrapin cost six hundred dollars.

Hishculture.

REPORT OF THE WISCONSIN COMMISSION.

REPORT OF THE WISCONSIN COMMISSION.

THE eighth annual report of the Fish Commissioners of I Wisconsin, for the year ending Dec. 31, 1881, is before us, A change has been made in the office of Superintendent, Mr. H. W. Welsher having tendered his resignation, to take effect in August, the board appointed Mr. M. T. Bailey to be his successor. A new hatchery, 24x45 feet, with an upper story for the residence of the assistant superintendent, has been built near Madison, and now gives a capacity to batch nearly 3,000,000 eggs of brook trout. The cost of this building was \$1,500. Up to date 1,500,000 eggs have been taken and deposisited in the troughs.

It is proposed to begin the hatching of whitchish, and to this end a hatchery is needed where lake water can be obtained at a reasonable cost. Here also the lake trout can be propagated and attention paid to other valuable fishes. Certainly Wisconsin has facilities for this work and her fishery interests on Lakes Superior and Michigan are great enough to demand the assistance of the State in the good work of propagating valuable species, as the whitefish and lake trout. The three most valuable fishes in the State are those named. The two latter as commercial products and the brook trout is an inducement to the thousands of persons living elsewhere, who wist the State to fish for them and leave behind then five times the table value of the trout captured. The revolutions of the rout captured. Of the rainbow trout, S. Iridea, the report says: "There were received in the winter and spring of 1880, at the State hatchery, from Professor Baird, United States Commissioner, two thousand impregnated eggs of the California mountain trout, which were successfully hatched and placed in one of the ponds. There were also received at the same place last spring a large number of eggs of this species, which were also

successfully hatched and retained at the hatchery for breed-

successfully hatched and retained at the hatchery for breeding purposes."

We regret the decision of the Commissioners to "await further developments" before attempting to hatch the grayling. This fish may disappear before they begin, and it is too grand a game fish to be allowed to be exterminated. It is not settled by European fishculturists whether their grayling will spawn when confined in pouls or not. American experiments have not been followed closely enough to determine this, although we incline to the opinion that Mr. Frank N. Clark. of Michigan, obtained a few ergs from fish which were rearred in a pond, but we are not certain that he did so, not having the deta at hand. We hope the Commissioners will reconsider this and devote a little time and money to experiment. We believe in experimenting and not in following a beaten track for fear of losing a little time or money, and the grayling is worth it. Our grayling angling will ever remain one of the brightest of memories, and our enthusiasm over this fish is as great now as it was when it was first discovered that it inhabited the streams of Michigan, or when we began a series of experiments to domesticate it, which only ended by a permanent business call to other parts.

Mr. Bailey, the Superintendent, makes a report of his work since he assumed charge, in which he says that he has at the hatchery, in addition to the brok and rainbow trouts, about one hundred cup, two hundred lake trout, thirty California salmon and a few grayling. Tables showing the distribution of the different fishes follow. The appendix contains extracts in fishe commissioners.

CARP IN LOUISIANA.—Mr. S. V. Martin writes to the New Orleans Times-Democrat as follows: On the 15th of December, 1880, I threw an embankment across a coulee or natural drain falling in the Teche, and by that embankment across a totalee or natural drain falling in the Teche, and by that embankment acre, and from 5 to 15 feet deep. I had received at date 20 German carp from the United States Fish Commissioner, which I put in my pond. The carp measured on December 15, 1880, about four or five inches in length. The dry spell we had last summer caused my pond to dry and proved to be a benefit to me. I will explain how. The carp 1 had in my pond in September, 1881, nine months after, I measured one of them, which was 22 inches in length. My pond being almost dry 1 put some of the carp in the Teche river and ate one of them to judge of the quality, which proved to be botter than any fish we have here, or at least as good as any.

On the first of the month I received 30 more German carp, measuring from two to three inches in length. I paid only 25 cents to the Express Company for the 30 carp.

I am confident that the raising of fish will be an advantage to any person who can have a pond. Out of mine, which cost me about \$20, I am sure to raise enough fish in one year for my own family use, besides selling enough in St. Martinsville to pay tive times the cost of my pond.

Hesides my carp I had in my pond when it drid up, about 200 perch and other small fish. I could not believe that a fish nine months old would grow so large in so short at time without any care or expense but the original cost of the pond.

I hope that our citizens will try this new industry, and if they do, in a few years our rivers and lakes will be full of good fish.

EASTERN TROUT FOR CALIFORNIA.—The Fish Commission of California are introducing the eastern brook trout, Satretians fontinalis, in their waters, and the people of that State consider them superior to their native species. So it goes. We are getting their rainbow trout, Sathon iridea, and are enthusiastic over their good qualities. It often happens that transplanted animals do best in their new home, and if this is the case with both these trouts then the exchange is a good one. Fish Commissioner Redding has a lot of fontinatis for distribution. He also says that the Commissioners are at present having half of the one hundred thousand whitefish eggs, received a few weeks ago, distributed in Donner Lake and Lake Tahoe.

MR. WATKINS ON THE CARP.—Mr. S. S. Watkins, of Red Wing, Minn., the State Superintendent of Fisheries, has just returned from Inis Eastern trip. We had a pleasant call from him while in New York, and found him alive to fisheultural interests. He took from Washington 169 carp, both scale and leather varieties. The fish were two years old and weighed from three-quarters of a pound to one pound and a half each. He was greatly astonished at the size of the national carp ponds and pronounces their arrangement and conduct admirable. He saw carp there that were six years old and which would weigh twenty pounds.

WHAT ARE WHITE TROUT?"—The Sacramento Bee says: "Clear Lake Indians last week caught several loads of white trout, from twelve to eighteen inches in length. It seems a reasonable conclusion that they are the fish put in the lake in 1872 by Livingston Stone."

Answers to Correspondents.

G. A. R., Cleveland, O.—Send for the book to N. C. Squires, Cortland street, New York. Price, 30 cents.

land street, New York. Price, 30 cents.

J. B. S., Dayton, O., wants the pedigree of the pointer dog Plunket; also his color, age and where owned. Can any of our readers give the information?

Solomon Isaacs, San Francisco, Cal.—I send you to-day some insects captured on a Western horned owl immediately after death. I have often found them on smaller birds. Can you tell me what they are? Ans. The insects sont are Diptera, and belong to the Hipporters of the wide includes also the well-known particular (Offersia). These specimens apparently belong to the genus Ornithongia.

thought.

W. H. V., Buffalo, N. Y.—I. What are the pedigrees of cocker spaniels Snip and Juliette, formerly owned by S. J. Bestor? 2. What prizes did the cocker dog Fred (Snip—Aluliette) win at the Pittsburgh, Pa., Dog Show in 1859, and how many other cockers competed with him for those prizes? Ans. I. All the information regarding the breeding of Snip and Juliette is that they were imported. There is no could that they were well bred. Snip was living at last accounts, and owned by Mr. F. F. Fircher, of Carcmont, N. H. Juliette has been owned by Mr. F. F. Fircher, of Carcmont, N. H. Juliette has been and Juliette 2d in her class at the sense show. 2. We have no record of the entries at Fittsburgh in 1879.

of the entries at Pittsungh in 1879.

PUBLISHERS' DEPARTMENT.

Barbless Hooks are preferred by many anglers to the old style of looks. Mesers, Wm. Mills & Son, the extensive fishing-tackle dealers of this city, keep a regular supply of barbless hooks, which, thuy tell us, are growing in favor. The Mesers, Mills stock comprises everything that an angler needs, and the firm is one of our old-established houses, well known to the readers of Forder and Stream.

Any one in want of a good Flobert parlor rifle should read the advertisement in this issue of E. G. Hoenig, 875 Broad street, Newark,

THE WATER COLOR EXHIBITION.

The fifteent annual exhibition of paintings, by the American Water Color Society, began at the National Academy of Design, in this city, on Johnston to Sevent and the National Academy of Design, the Color Society, began at the National Academy of Design, the Color Schown, a number of etchings are exhibited by the New York Etching Club, We have taken notes of such the petures as we considered would particularly interest to the petures as we considered would particularly there are not to the peture and the peture of the Color of the C

is only lightly clouded. It is well painted, throughout. No. 227 is a good semi-tropical sunset "View on the St. Johns," by Granville Perkins. No. 228 is a view "At Pigeon Cove," by Geo. H. Smillie. We look out upon the water from a shore of verdure, low trees and rocks. No. 223 is a catin day "On the Sound," by Henry Farrer. The water is smooth, and there are several sloops near with sails scarcely moving. This is a worthy work. No. 234 is "A Sketch; Easthampton," by Bruce Crane, and represents a road with bright, wild vordure on each side. It is an attractive little picture, and cheap at thirty dollars, the price asked. No. 239 is a semi-tropical "Scene on the Ocklawaha," by Granville Perkins. No. 243, a "Spanish Gipsy Feeding Figeons," by Gerone Ferris, represents a man in Spanish costame standing in a street with pigeons perched on his arms and circling around bin, while in his right hand he holds food for them, which some are picking from the pavement as he drops it. This is a brightly colored and pleasing work, but its appearance is somewhat marred by the inferior frame upon it. No. 245 is "Beeches by the Brook," by Wm. Biss Buker, showing a quiet little rocky stream faintly lit by the sunshine through the beech tree leaves. The perspective, looking upon the brook, is very fine.

This finishes our comments on the pictures shown in the

This finishes our comments on the pictures shown in the north and east galleries of the Academy. Those in the south gallery and the corridor will be described in our next issue.

BENCH SHOWS.

BENCH SHOWS.

March 7, 8, 9 and 10—Pittsburgh, Pa., Bench Show. Chas, Lincoln, Superintendent. Entries close Feb. 25.

April 18, 19, 20 and 21—New York, Sixth Annual Bench Show of the Westminster Kennel Club. Chas. Lincoln, Superintendent.

May 9, 10, 11 and 12—Boston, Mass. Third Bench Show of the Massachusetts Kennel Club, Edward J. Forster. Secretary; Chas. Lincoln, Superintendent.

FIELD TRIALS.

September—National American Kennel Club Field Trials on Prairie Chickens. Jos. H. Dew, Columbia, Tenn., Secretary, December—National American Kennel Club Field Trials on Quall, Grand Junction, Tenn. D. Bryson, Memphis, Tenn., Secretary.

QUARTERING, STYLE AND SPEED.

Chickens. Jos. H. Dew, Columbia, Tenu., Secretary.
December-National American Kennet Club Field Trials on Quall.
Grand Junction, Tenn. D. Bryson, Memphia, Tenn., Secretary.

QUARTERING, STYLE AND SPEED.

IN a late number "10ld Pogy" asystant quartering, sight and speed are points that very few thorough sportsuich would be willing to dispense with. He does not seem to think that any but wide rangers and stylish and speedy dogs will pass birds without should plem. But I think that stowy dogs are seening powers. Your correspondent also says that in the rules given by Stonehenge, the angles are too great. I contend that a thoroughly broken dog will make his own angles. I don't suppose there are very many dogs broken altogether to the rules fail down by Stonehenge. Your correspondent says they would do better for down wind work. I cannot see for down you'd work. Your correspondent says seen the gog, enter the field and let him have the benefit of the wind, and you will not have your dog do double work, for it is surely tiresome to have to wait for a slow quartering dog to perform this kind of work. I have done it with very fast too breakfast, with everything ready for a good day's sport. In regard to that 200-acre field, he says that he did take his slow quartering dogs in the same field and barged twenty-five brown by bard on the same field and barged twenty-five brown by bard on the same field and barged twenty-five brown by bard on the same field and barged twenty-five brown by bard on the same field and barged twenty-five brown by bard on the same field and barged twenty-five brown by bard on the same field and barged twenty-five brown by bard on the same field and barged twenty-five brown by bard on the bandler of the pointers only barged sixteen. Now, I do not take this as proof to which brace of dogs did the best work, for, as a general thing, most of sportsmen should only lill to points, and nost of sportsmen should only lill to points, and nost of each brace, to tell which did the best work, for a field of

your dog hunted it all out, which you have to do with the slow dog; the pleasure comes in in seeing a fine, stylish, speedy and handsome and quartering dog do his work. A true sportsman don't go out just for the number of shots he cannot come to the speedy of the stylish of the come to the com

least not many slow dogs can win in field trials, they will do for "Old Fogys" to bag birds over, but they are stayaways from field trials.

You say you of the West have considered the question. I hope you have, and will come and take part in the field trials next fall, and come in contact with some of this style and speed without any field qualities, and there will be another "Old Fogy" that will think if his dog only had went a little faster he would have gotten that hest point, instead of going along as stealthy as a cut, and letting style and speed get the point. Now, I hope "Old Fogy" will make a successful cross with his hounds and fox hounds, which his fair speed, staunchings that will run in field trials with his fair speed, staunchiness, backing and retrieving against the fine qual terring, styling and speedy good-nosed dog that it takes to win in field trials at this present day. The only way "Old Fogy" can get things by the beels is to come and win in the field trials with his tair speed without style.

WILMINGTON, Del.

PITTSBURGH DOG SHOW.—The entries for the Pittsburgh dog show are coming in rapidly and many fine animals will be present. Everything is going on swimingly, and the success of the show is already assured. Intending exhibitors should bear in mind that the entries close Feb. 25.

ROYAL FAN—CROXTETH PUPS.—Mr. Washington A. Coster, of Flatbush, L. I., writes us that he has just received a magnificent pair of puppies from Mr. S. B. Dilley, of Rosendale, Wis., out of his Royal Fan by Mr. Godeffroy's Croxteth. Mr. Coster is in ecstacies over their good looks and beautiful forms, pronouncing them the best that he has ever seen. The dog belongs to Mr. Godeffroy and the bitch will remain in the kennel of Mr. Coster.

NATIONAL DERBY ENTRIES.

MEMPHIS, Tenn., Feb. 3.

Editor Forest and Stream : Editor Forest and Stream:

The following entries for the National American Kennel Club Derby have been received since my last report. I have a great many applications for entry blanks, which leads me to think the entries this year will be larger than ever before. Entries close April 1, 1882.

D. C. Sanborne, Dowling, Mich., enters "Blaze," liver and white setter bitch, by Count Noble, out of Spark, born July 13, 1881.

C. Sanborne, Dowling, Mich., enters "Nellie Bey," black white setter bitch, by Count Noble, out of Nellie, born July

18, 1881.
D. C. Sanborne, Dowling, Mich., enters "Count Dad," black and white setter dog, by Count Noble, out of Nellie, born July

18, 1881. Crawford and Wallace, Memphis, Tenn., enter "Gath," black, white, and tan setter dog, by Count Noble, out of Pcep o' Day, born April 18, 1881. Entry blanks will be mailed on application by D. Bryson.

THE COCKER CLUB.

THE COCKER CLUB.

Editor Forest and Stream:

I desire to call the attention of all engaged in the improvement of the cocker spaniel to the following, which the committee of the American Cocker Spaniel Club are of opinion will be of interest to all. Three bench shows are about to be held, Pittsburgh, New York and Boston. The premium list for the first is already out, and that for the second will shortly be, as will later on be the Boston list. The committee have voted 810 for the best cocker shown at Pittsburgh, and \$25 for New York, to be distributed between dogs, bitches and pupies. These prizes are open to competition between club members only, and any person desiring to got a chance of winning any-of the money can do so upon joining the Cocker Club, the annual subscription to which is only \$2. At no show can any exhibitor get the privilege of entering any number of dogs with a chance of winning four prizes for the sum of \$2, and the committee think this fact needs only to be known to induce all intending exhibitors to join the club.

I desire further to call the attention of breeders to the opening of a produce stakes upon conditions somewhat similar to those of English clubs having the same object in view as has the Cocker Club. It will be called the

COCKER SPANIEL PRODUCE STAKES,

those of Engins a clubs maving the same object in view as has the Cocker Club. It will be called the COCKER SPANIEL PRODUCE STAKES, and will be open to all pupples whelped on and after February 1, 1882, to be shown at the Westminster Kennel Club show of 1883, and to be judged according to the scale of points adopted by the American Cocker Spaniel Club on the following conditions: Bitches to be entered prior to whelping, entrance fee \$2 each, the person entering the bitch upon payment of the further sum of \$3 to the stakes may show as many of the pupples as he may desire to compete for the prizes. These payments being distinct from the entrance fee due the Westminster Kennel Club, will entitle them to compete for the prizes of that club. Should any of the progeny of an entered bitch be sold the purchaser, if he desires to compete for the Produce Stakes, must pay \$5 to the cocker club severtary on or before the date of the closing of entries for the show, this sum to be added to the stakes. The cocker club severtary on or before the added to the stakes. The cocker club severtary on or whost priced as follows: Fifty per cent, to the breeder of the winner, fifteen per cent, to the second, and ten per cent, to the hird. N. B. The breeder is understood to be the person owning the bitch at the time of service.

If only twenty bitches are entered that will make \$40 to begin with, and if puppies from only half are shown at New York there will be \$70 for division. In fact, if it fills as it should, and by that I mean thirty or forty bitches, the prizes for cockers at New York next year will be the most valuable to be awarded at the show. The expense note that mainly through the exertions of the Cocker Club Committee the cocker classes have been divided at Pittsburgh, and blacks placed by themselves. Communication has been had with the Westminster Kennel Club, and I am advised that the classes for cockers at the forthcoming show will be numerous and the prizes liberal, and here also there will medoated by themselves.

453 West 43d St., New York.

BLACK AND TAN SETTERS.

BLACK AND TAN SETTERS.

THERE has been some correspondence on this subject in the English papers. In a late number of the London Field Mr. Wm. Sergeantson, well known in dog circles, says: As I have judged these classes several times the last year or two, perhaps you will allow me to answer your correspondent "Inquirer." I must, however, denur altogether to "Not an Exhibitor's "flattering opinion of my judgment, as I know numbers of men who have more experience and more knowledge of the breed than I can lay claim to. I quite sympathize with "Inquirer's mearks as to white on the breast of a black and tan setter; but I think he is rather hard on the judges, for I do not know of any who would cast an otherwise good dog for so slight a fault. I have certainly read criticisms of shows in which the reporters have objected to dogs on this score, but I have always set it down as a proof that the writers have had more acquaintance with setters on the bench than in the field. Speaking for myself, at all events, I may say that I would never consent to degrade the grand black and tan setter to the level of a toy dog by judging him chiefly by color and markings. Too much attention to mere brilliant coloring has already done vast mischief to the breed. It stands to reason—at least if there is any truth in the theory of breeding by selection—that setters bred for, say, ten generations for color rather than for working qualities, will be inferior in the latter point to those which have been bred for the same length of time for working qualities first, color being only a secondary matter. It is also a curious fact—which, however, all old breeders will corroborate—that in a litter of black and tan setters the best colored whelps are, nine times out of ten, by no means the best shaped ones; and by choosing whelps for color alone, shape and make have undoubtedly deteriorated. Unfortunately, too, in the early days of shows, prizes were awarded in the black and tan dasses—then the most fashionable breed of setter—not to the most wor

try, but they are not of the stamp which is too often seen at shows.

Many of your readers may remember "Sixty-one's" setters—hard, untiring workers, that could go fast and stay as well—but they were not show dogs. Though it is only right to say that froin his kennel came the dam of the two best Gordon setters, to my mind, that have ever been shown, Major Elwin's Mr. Macdona is also correct as to Lord Lovat's kennel at Beauly, unquestionably the finest kennel of Gordons in the world. His dogs are many of them more white than block as also were many in the Duke of Gordon's own kennel.

I do not think, however, that it would answer to have classes confined to pure bred Gordon's, for this reason, that no man on earth could look through a class, and say with certainty,

"This is a pure Gordon; that is only a black and tan;" and so the result would be constant squabbling about pedigrees and disqualifications. We have already seen just such a difficulty in the Sussex spanied classes.

I should prefer the plan of having black, white, and tan classes. They would give more scope to Gordon breeders, and might save the life of many a poor pup, whose white shirt and stockings now bring him to the bucket. At the same time, in judging such a class, I should hesitate about giving a prize to a black and tan with only a patch of white on the chest. He might be eligible for a prize, according to the letter of the law, but scarcely, I think, according to its spirit. Of course, in judging a class of black and tan setters, color must have its due weight, but let shape and make and setting quality come first.

st. Let us have black and tan setters with leaner, lighter Let us have black and tan setters with leaner, lighter heads, very much longer aneks, very much longer and more sloping shoulders, very much deeper and narrower chests, very much shorter legs, better bent stiffes—more, in short, of the racehorse, and less of the carthorse. When we have got all this, we should stand more on an equality with English setter breeders, and then it will be time enough to quarrel about such trifles as a few white hairs. One of the best black and tans of late years—Mr. Mapplebeck's Blossom—was bred from a very handsome bitch, which was ticked all over with small white flecks, but I do not think she was very much the wasse for its property in the standard of the standa

small white flecks, but I do not think she was very much the worse for it.

By the by, I should like to correct a mistake of the K.C.S.B. as to the breeder of this dog. He is there said to have been bred by the Rev. J. C. Macdona. I have often wondered that Mr. Macdona did not correct the mistake himself, as he must many times have seen it in the catalogues. Blossom was bred by Mr. H. Stokes, of Setton Park, Liverpool, the owner of his sire and dam, champion Shot and Bloom. He was sold by him as a puppy to Mr. Macdona, who resold him to Mr. Mapplebeck.

"Inquirer" asks what are the best points of this breed. Undoubtedly their grand nose, their great docility, and fine tempers, which make them, as a rule, so easy to break. They only want more careful breeding to make thom, as "Inquirer" says, Al. At present the bitches, being more active, are charming shooting companions, but the dogs are far too often sadly heavy and slow.

sadly heavy and slow.

A CARD FROM MR. STOKES.—RICHMOND, Va., Jan. 26, 1882.—Editor Forest and Stream: If there are any of your readers who contemplate sending their dogs to A. Winter, of Bainbridge, Ga., (formerly Cairo) I would advise them to correspond with either Mr. T. F. Taylor, of this city, or myself; we can tell them from dearly bought experience all about him. Mr. Taylor's Tumtum, a magnifecth "Crack-Diana" puppy, died a week after his return from Winter, from the effects of long continued and shameful neglect. Taylor's "Dashing Rover" was returned in an almost dying condition, and my Lucille showed too plainly that she had not only been grossly neglected, but most outrageously cowed. These dogs had been in his hands eight months, except Rover, who was there only four months, and I can prove had not been yard broken, and hadn't the slightest idea of what was required of them when put on game. This letter is not written to injure Winter (his lizzle at Grand Junction did that work) but simply to protect gentlemen sportsmen who have dogs to be trained. I think it high time that this class of men, calking themselves trainers, should be shown up.—Chas. P. Stokes.

PITTSBURGH DOG SHOW.—Special prizes K and L.—Please state that the American field trial record will only be considered in those two classes, and in class L the dogs must be owned and entered by the exhibitor or from one kennel, Irish water spaniel, special prize.—Messrs. J. H. Whitman and J. D. Olcott, proprietors of the Excelsior Irish water spaniel kennel, offer \$20 cash for the best Irish water spaniel dog or bitch, bred at and purchased from the Excelsior water spaniel kennel. Donors not to compete. Entries close positively \$5th inst., Chas. Lincoln, Supt., lock box 303, Pittsburgh, Pa.

EASTERN FIELD TRIALS CLUB.—All members of the Eastern Field Trials Club, having the welfare and success of the association at heart, are respectfully requested to honor the notices issued by the ex-treasurer, George T. Leach, Esq., for the payment of dues in arrears, and remit the same without further notification, and oblige WASHINGTON A. COSTER, Treasurer of the E. F. T. Club, Flatbush, Kings county, L. I.

NATIONAL AMERICAN KENNEL CLUB STUD BOOK.— The entries for the second volume will positively close April 1, and all who wish to register their dogs should at once send to Dr. N. Rowe, Chicago. Ill., for blanks. See advertisement.

KENNEL NOTES.

RENAMED NOTES.

NAMES CLAIMED.

Brian Boron. Editor Forest and Streum: I see in your issue of Jan. 19, 1883, Mr. John Goodt, of West Lebanon, N. H., claims the name of Brian Boron. As I claimed the same name for my sudsetter pup April 23, 1881, in another paper, I, hope Mr. Godt will change the name for his puppy.—ELSWORTH S. SEITH, St. Louis, Mo. [Unless names are recorded in these columns, we cannot see how readers of the Forest and Stream can be expected to know anything about them.

bout them.

Tramp Dale. By Mr. C. Fred, Crawford, North Providence, R. I., or while, with orange-ticked head, setter dog by Grouse Dale out of ady Thorne (Lounsbury's Frince—Lee's Belle).

Prince Date. By Mr. James Linn, Atglen, Pa. for orange and white the dog by Grouse Dale out of Lady Thorne (Lounsbury's Prince—

Lady Thorne (Louisbury's Frince—Lee's Beffe).

Prince Dele, By Mr. James Linn, Atglen, Pa. for orange and white setter dog by Grouse Dale out of Lady Thorne (Louisbury's Prince-Lee's Beffe).

Dita. By Mr. George B. Inches, Boston, Mass., for black and white English setter bitch, whelped July, 1881, by Lelaps (Leicester—Doll) out of Dido (Dash III.—Mollie).

Docter Duer. By Mr. W. A. Strother, Lynchlung, Va., for blue bolton and black English setter dog, whelped Nov. 20, 1881, by Gladstone out of Frost.

ton and mask English setter aug, whereat nov. 25, 1881, by Ghaustonia ut of Frost.

Nell Umpane. By Mr. W. W. Barrow, Richmond, Va., for red Irish setter bitch, whelped April 4, 1881, by Dash (——Ruby II.) out of Meg (champion Elcho——).

Shafio to Prince Laverack. Mr. James H. Goodsell, New York, wishes to change the name of the pure Laverack. Mr. James H. Goodsell, New York, wishes to change the name of the pure Laverack dog shafto (Pride of the Border—Petrel) to Prince Laverack.

this week?

To the Secretary of the New York Yacht Clab:

"New York, Jan. 4, 1832.

To the Secretary of the New York Yacht Clab:
"Data Sin—I have to acknowledge the receipt of your letter of December 17, 1831, inclosing the resolutions of the New York Yacht Club of Halt State, and also the return of the America's Cup to me as the survivor of the original donors.
"I fully concur with the views expressed in the resolutions that the deed of gift made so many years ago is, under present circumstances, and equate to meet the intentions of the donors and too onerous upon the data in possession, which is required to defend it against all challengers.

the ofth in possession, which is required to detend it against an ennelengers.

"As the New York Yarch Club, by your communication and under
the resolutions themselves, express a desire to be again placed in possession of the cup under new conditions, I have conferred with the
committee appointed at the niverting and have prepared a new deed of
committee appointed at the niverting and have prepared a new deed of
cards both challenging and cirallenged parties. It forms
the considered just and salisherstory to organized yearts clubs of all countries.

"There is one clause which may require explanation. Owing to
the pressort and increasing size of occan steamers it would be quite
feasible for any American, English or French club to transport on

their decks yachts of large tomage. This might be availed of in such a way that the match would not be a test of sea-going qualities as well as of speed, which would essentially defract from the interest of a national competition.

The America's Cup is grain offered to the New York Yacht Club, subject to the following conditions:

"Any organized yacht child of a foreign country, incorporated, patented or fleensed by the legislature, additionally or other executive department. having for its annual regatta an ocean water course on the sea or an arm of the sea one which combines both, practicable for vessels of 300 tons, shall always be entitled; through one or more of its members, to the right of stilling a match for this cup, with a yacht or other vessel propelled by sais only and constructed in the country of the club holding the cup.

"The yacht or vessel to be of not less than thirty nor more than 800 tons, measured by the Custom House rule in use by the country of the challenging party.

"The challenging party shall give six months' notice in writing, anaming the day for the proposed race, which day shall not be later than seven months from the late of the notice.

"The parties intending to sail for the cup may by mutual consent measurement of the country of the challenging party with the late of the notice.

"The parties intending to sail for the cup may by mutual consent measurement months from the late of the notice.

"The parties intending to sail for the cup may by mutual consent measurement months from the late of the notice.

"The parties intending to sail for the cup may by mutual consent measurement months from the late of the notice.

"The parties intending to sail for the cup may by mutual consent measurement months from the late of the notice was to make the parties and sailing regulations and any and all conditions of the match, in which case also the six months' notice may be valved.

"In case the parties cannot mutually agree upon the terms of a match, then the challenging party shall have th

JUST CRITICISM.

DUST CRITICISM.

Editor Forest and Stream:

1 have read with interest, doubtless in common with your many readers who take an interest in yachting, the discussion of the measurement question, and have derived not a little anusement, as well as instruction, from the discussion—amusement from the persistent perversences of sundry sticklers for old prejudices as opposed to reason, common sense and naval science, and instruction from the able and forcible mamer in which you have exposed the fallacies of your antagonists, and ladd before us, with a clearness of the fallacies of your antagonists, and ladd before us, with a clearness of year the expectation of the play is afforded to every description of our twenty the expectation of the play is afforded to every description of our twicth the play is afforded to every description of our two there is the consistency in a contemporary of yours devoted to the turf I would note, in addition to the scathing exposure contained in your issue of Jan. 26. The inconsistency, ignorance and stubbornness displayed by your contemporary is laughable. Its reporter frequently expresses the opinion that whatever gives sail-carrying power should be taxed; but yet, with the greatest inconsistency, he at times advocates a mean-length rely, under which beam goes untaxed! Could mortal man contradict himself and confute his own arguments more effectually:

be taxed; but yet, with the greatest meonsistency, as a time to cates a mean-dength rule, under which beam goos untaxed! Could mortal man contradict himself and confute his own arguments more effectually:

While on this subject beth me add a mite to the centreboard is shoops we deep-draft cutter discussion. In the second of the Mischief-Atalanta tepped and the properties of the Mischief-Atalanta the properties of the mean and the properties with the racers. She started a few minutes before the racers, and was certainly not more than six minutes alread of the Gracie at the turning point, and finished about two minutes belind the big sloop, so that in a thrash of sixteen nautical miles, dead to windward, the cutter actually beat a very fast centreboarder nearly thrice her toninage on time. Now, the Oriva is, in my opinion, not a pretty yacht; neither is she fast, as I have it on the authority of your antagonists that the little Madge in her race with the Oriva, the day that the Schemer the point of Sandy Hook hollow, but it did not sait the camy Scotchman in charge of the Madge to 'hear' cutter stock, and he slacked up and permitted the Oriva to win the race by a trifle over three minutes.'' Now, I would like to ask the advocates of the light-draft sloop if so slow a cutter as the Oriva is made out to be can beat as fast a stoop as the Gracie, turning to windward in a smart breeze and without much sea running, how would the best of American sloops fare with a big cutter—redistry as fast as the Madge—under similar circuity of the many and the properties of the Madge to 'hear' is the properties of the Hallender of the Carlot of the Hallender of the light-draft sloop if so slow a cutter as the Oriva is made out to be can beat as fast a stoop as the original of the dependence of the hallender of the light-draft sloop if so slow a cutter as the Oriva is made out to be can beat as fast a foreign of the farming to windward in a smart breeze and without much sea running, how would the best of American sloops fare out the

after.

BELLEVILLE, ONT., Jan. 29.

[The contemporary to which our correspondent refers does not rank very high as a yachting journal, and but for the powder it steals from us would not be able to fill a column. Its contradictions and tudicrous efforts at criticism would be amusing enough but for the disheartening drawback that the stuff is deemed all that is necessary for the yachting public. Persons of ordinary sense, even if not claiming technical proinciency, would be slow to compare the speed and behavior of a yacht 52% to load line with another of 24%, on even terms. The Grack lat a can which might not bother Grack would be rough water for Oriva, and that a whol is might not bother Grack would be rough state or Oriva, and that a whol is which the former could just carry whole sail would call for a reef in the smaller yacht. To compare the performances of the two, under such circumstances, without allowance for difference in tomiage, is so thoroughly assinous that we have never deemed our contemporary's verdant stupility worth notice, for it must have been manifest enough to the increasing with so much larger yachts as Gracke and Mischief was nost creditable under the circumstances. Oriva is not, as far as we have been able to observe, a particularly fast yacht, though she is quite up to the average of her size. Much should be allowed for her miserable fit of canvas which we are glad to know is to be replaced by a suit of the average of her size. Much should be allowed for her miserable fit of canvas which we are glad to know is to be replaced by a suit to the average of her size. Much should be allowed for her miserable fit of canvas which we are glad to know is to be replaced by a suit to the average of her size. Much should be allowed for her miserable fit of canvas which we are glad to know is to be replaced by a suit of the average of her size. Much should be allowed for her miserable fit of canvas which we are glad to know is to be replaced by a suit of the average of her size. Much should be allowed

LENGTH, BEAM AND DEPTH.

ELICATH, BEAM AND DEPTH.

Editor Forest and Stream;
Two or three years ago when ministure yachting was at the height of its popularity, the large fresh water lake in Prespect Park was the seen of many an exciting contest, and as at that time grown men and not boys engaged in the sport, much valuable information was obtained by practical experiment.

In those days there were two closes of boots, a sixty inch class and aptivals find class, the seliconer rig being the favorite, with a slight aptivals find class, the seliconer rig being the favorite, with a slight right, and the seliconer rig being the favorite, with a slight right, and the seliconer right of sloops, and all were reced together on an over-all-length right.

Now, as the cost of building a miniature yacht was very slight, the effect of any system of measurement could be seen by the new fleet of boats which were built to evade it, almost immediately on its introduction. When I first became interested in the sport this length rule was in force, and I remember well a certain schooner familiarly known as the "Mind Turtie" having fifty per cent. of her length for a brain, and a keel so deep that it had to be supported by a wire stay.

Well, the yachtsmon became disgusted with that sort of thing, and a rule was adopted which produced very nice little boats, the most successful being three to three and a half beams in length.

The rule was as follows; The mean length, two-thirds of the extreme-

beam and one-half the extreme depth from top of deck to underside of motal keel, were added together and a linear allowance of these records are in the contract of the contra of motal because a closed expending in the close to merce of motal because a closed expending in the close to merce second per fuch was given over a quadra mile cause. I do not close that this is the best rule to adopt for large yachts, but with small vests, the amount of outside ballast that, can be carried is so pread on its depth so important a factor of speed, that I offer your contributor these few facts in the hope that they may help to said the vest question of fime allowance by creating discussion in the direction of linear rather than a cubical incasurement.

Januar Gale.

SWALL RICS.

Editor Forest and Stream;

After looking at the sail plan of the Laloo in your last number, I am tempted to ofter a suggestion. My plan proposes standing gad's, with hoops or riugs on gaff and boom, indiards are attached to sails at peaks and passed through blocks at outer end of gaff, thence through the rings to a block at the throat, thence to cleats of deck, or may be carried aftwo as to be within easy reach of the crew of one, while he retains his seat, all sails set, To reef by means of hallards the sail's gathered in from peak to throat until you have only that the sail's gathered in from peak to throat until you have only that the sail's gathered in from peak to throat until you have only that the sail is all sail let go at end of boom, slide canvas up to mast and a few turns around sail ford one makes all sang. To make sail is simply to reverse the above operations. With a traveler for the foresheet, is should think this rig as easy for one man to bandle as that of any catboat, and much more so than any sloop. The same sails with sprils are used on our Mackinaw boats, the fore boom being often omitted and several statched the same as to a fin on a sloop. The bar of the sail is the sail is a feasible one. The nizer of some way. A peak inhand rouses the peak of the sail in towards the mast, the head of the sail traveling on the gaff with regular hoops. The foat is also reduced in much the same way. A peak inhall nouses the peak of the sail in towards the mast, the head of the sail traveling on the gaff with regular hoops. The foat is also reduced in a like fashiou by listuiling on brials leading up frough blocks at mast and out to the leech where the chot is made fast or passed down to the deck. The objection is line sailing would be the folds at the leech acting as wind catcher.

YACHT STOVES.

VACHT STOVES.

Editor Ferest and Streum:

Let me condense hito one article "what I know" about a prominent subjects of discussion at this time in your valuable journal. In the first place as to proper stoves and fuel for small yachts. Why do not some of your correspondents say a good word for charcoal. In our boating excursions in Northern China we were obliged to use it, and it has many advantages, such as no snoke, no disagreeable aroma, and when in full blast, one of the purest and hottest of fires, aroma, and when in full blast, one of the purest and hottest of fires, and it has many advantages, such as no snoke, no disagreeable better to broil game or fish upon, as it is absolutely without smell of any kind. Let me tell you how to build the furnace. In China we used pottery, but to prevent all accidents I should recommend a stove of froir. This furnace or stove should be built in the shape of a large flower pot, a little wider at the top than at the base, with five or six small bens of froir or moning through and across it, at about five inches in depth from the top, to form the grate upon which to rest the fuel; six inches long, and six inches wide to allow a draft, through to the fuel on top. To use this simple affair put in some light material on the burst or grate, such as a few whithings, paper, etc., and on top of this fall in the furnace full of good charcoal. Innite from below by putting the hand into the oval opening on the side, and then by the use of a fau, vidently waved in front of this opening, force the ingention of the charcoal, which, in a few moments, will present a body what better for the reception of the gridron and its burden of this or game; For simplicity, neatness, quickness of preparation, and adaptability, I defry you to beat charcoal.

EXPERIENCE TEACHES.

EXPERIENCE TEACHES.

EXPERIENCE TEACHES.

WHEREVER scope is given to experiment and the free development of model is not hindered by purely local contingencies or sterile conservatism, we find the lessons of actual practice agreeing with our teachings. The fishermen of Key West carry on their labors in a vast heet of small decked boats. Being cheap to build because so small, and therefore built in great numbers, permitting trifling experiments and therefore built in great numbers, permitting trifling experimentally developed into a good sea bout of wholesone depth and draft, combined with an easy blige. We recollect some of their beats, but very little removed from the pure blooded cutter in type. A correspondent from that coral studder region sends the following in confirmation; Allow me to say that I thoroughly enjoy your excellent paper; while some years ago I only bought it occasionally as alwairy, I now look upon it as a necessity as well as a confort. Your view, upon the yearth building are the same adopted (after experience) by the "conch" builders of our fishing boats.

NEW YACHTS.—Lawley & Sons, City Point, South Boston, are to build a new steam launch left, long and the Pierce Bros. have in hand a new sloop of the medium type, which we hope to see rigged as a cutter. She is 38ft, over all, 33ft, on the line, 11ft, beam and 5ft, water without the board. On such a deep boat a keel would scen preferablements they are to be a considered and some left and the results of the considered and some left of her can be formed. She shows a lot of room below and is very taking in appearance. The Lawleys are doing excellent work on the job. It is said this cutter will try on Madge next summer. Medamis & Son, of course, supply will try on Madge next summer. Medamis a son, of course, supply will try on Madge next summer. Medamis a son, of course, supply to have a twenty-ton cutter, similar to Madge in general type, and altity. Robertson will be supplied with a smart twelve-ton cutter. The yacht Isis, belonging to Major belano, of Thompson, Me., is to be fitted with improved Brayton petroleum enginess as an experiment continued from last year. Neafle & Levy, of Konsington, Phila., are putting the machinery in the new steam yacht Brunette, recently Launched by Bart Hillman, at Cooper's Point, Canden, N. J., for Mr. Peabody's use in Southern waters. The yacht is 89ft, long, 15ft, beam and 45ct, draft, ready for sea.

draft, ready for sea.

INSTANTANEOUS PHOTOGRAPHS.—One of the best photographs in existence is that of Portsmouth Harbor recently taken by the instantaneous process. Six plates were used, and the soveral sections untied are about four and a half feet in length. In the limmediate foreground, just below the spectator, lies Her Majesty's ship Scrapis, which the line white sides spart in bright sunshing and particularly the state of the state of the state of the state of the spart of the price. The great length of the harbor stretches out to right and left. The found and the snubles of the steamers, the rippling of the water, and the curling of bunding in the breeze, are all said to be perfectly distinct and free from the smallest suspiction of a blurr. We have also seen some excellent instantaneous views of canvas racing under sail, in the private collection of Mr. C. G. Y. King, They were marvels of lifelike perfection, though some were the work of anaxeurs. We should like to see more attention given to photographial y achieved and canoes in New York. Boston is far ahead in this respect. Possibly the N. Y. Canoe Chiu Inghi meet on their float some ince day and be photographed in a body with their canoes to start the ball.

SINGLE HANDERS.—There is a band of sympathy uniting all who

photographed in a body with their cances to start the ball.

SINGLE HANDERS.—There is a band of sympathy uniting all who tool their craft alone and the growing class of "single handers" have been looking for some institution under which a union could be made to conduce to strength and the furthernness of common interests. The American Cance Association has in the preamble to the new constitution resolved to widen its sphere so as to include all who rely entirely upon their Individuality in distant cruising. No better flag could be fosted by the single handers, and in conjunction with the whelters before the single handers, and in conjunction with the whelters before the single handers, and in conjunction with the whelters before the configuration. The interests of the salling cancels and the small yield the configuration of the single handers and the small yield foregor made his memorable voyage from London to Paris in his two in yard kto Roy, in 1867, under the colors of the Royal C. C., so do we hope to find similar venturesome spirits gather under the follow for red, white and red of the A. C. A. By an exchange of experiences and a comparison of notes much useful information could be picked upon from the other and many a new convert made and fresh elements attracted to the water.

attracted to the water.

RIGS TO BE ENCOURAGED.—Short lower mast and low hoist; double headsail and short boom; lofty topmast and large square-headed topsail. With such a rig you have a great area for light winds, and for a blow, with light sails stowed and topmast housed, you are snugged down to short spars and low canvas. Such is the sailors snugged down to short spars and low canvas. Such is the sailors snugged down to short spars and low canvas. Such is the sailors snugged down to short spars and low canvas. Such is the sailors snugged down to short spars and low canvas. Such is the sailors to short some state of the sailors than a sparsaker the sail is the or of them. In grant part of the sailors than a spinnaker pole over the side after the hallooper has been part below. The notion that a lorge square header cannot be made to stand on kite, with a great many other old-fogy crotchels. For cruleing and kite, with a great many other old-fogy crotchels. For cruleing and for rating we think the mainsail loose on the foot an advantage and, at all events, deserving of trial. Tricing up the tack at a moment's

notice is the handlest thing imaginable when fishing, knocking about or working a crowded fair way. Double headsait has been shown by actual trint every bit as first and probably closer winded than the stringle high even on sloops not intended for such an arrangement. For emissing double headsait is much to be preferred. We have been slapered to the headsait is much to be preferred. We have been slapered to the headsait is much to be preferred. We have been slapered to the headsain in practice, but prefer it to the old-fashioned sloop on every count. Limitations to light sails or spars produce overgrown lower steels and the chunsy rig of a machine.

THE YAWL—An inquiry has come to hand asking for an explanation of the fadilities of the yawl rig supplied to the bostom schooner Whiteen last year, as reported by: correspondent last seek. We rise not aware why the rig should have been deemed a failure, and possibly the owner of the yacht in question may supply the answer. The yawl is extrainly faster and more weatherly than the schooner, it has been tried with satisfactory results on Hr. Williams' sloop Caprice, or New York, and has made that boat a stiffer, landier vessel, and, as we have been assured, the loss in speed has not been noticeable. The yawl is a great favorite in San Freucisco, and quite the fashion among cruisers abroad.

COST OF CUTTERS.—Here we have a cutter. She costs a Great

among cruisers abroad.

COST OF CUTTERS.—Here we have a cutter. She costs a Great death. Here we have A sloop. She Costs very little. Do cutters cost More than sloops? That depends, Why do they Cost more? Because a gold watch exist slove than a Th watch. It is cheaper to throw a Ago clauser of the costs and the costs and the costs and the costs are considered to the cost of the costs and costs are considered to the cost of the costs and costs are considered to the costs and costs are costs and costs are costs. The costs are costs and costs are costs. The costs are costs and costs are costs are costs and costs are costs and costs are costs. The costs are costs are costs and costs are costs are costs and costs are costs and costs are costs are costs are costs and costs are costs are costs and costs are costs. The costs are osts are costs are costs are costs are costs are costs are cost

such saways near, No matter what the cut May be.—Forest and Stream Primer.

YACHT BUILDERS.—We call attention to the shops of Samuel Ayers 37 Feet Slip, as an establishment where anything can be timed out from a fingey to a full feetged cable yacht. Mr. are all stable of the stable of the stable of the stable of the stable yacht. Mr. are shifted builder of long experience, and all his work has a new topolitan finish equal to anything turned out. As he understands drafts, and can "lay down" and "take off," we have pleasure in commending him to our readers as one whose work is concientiously put together and reasonable in price. He can build sloops, entres or steam yachts, in all of which he has acquired great proficiency.

NOT A VICTIM.—We are informed that the new sloop Jowell noticed in last issue is only 20th, long and not intended to be set up as another victim to the Madge. Her owner, Mr. Auketell, is putting two and a half tons lead on the keel, because he believes in the soundness of what Forest and Stable of the sta

hold.

THE AMERICAN YACHT LIST,—Neils Olsen is about to publish a second edition of this useful little pamphlet. It will contain a more complete list of yachts than last year's issue and will be perfect in unany of its details. This publication will, we hope, receive the support of the public, as it is the only thing of the sort in America, and should bee one as germanent an institution with us as Hunt's List or Lloyd's Register is in Great Britain.

Lloyd's Register is in Great Britain.

CAPSIZED.—The fishing schooner Stormchild, Captain Young, of Greenport, L. L., in conning through Buttermilk channel, New York harbor, was struck by a puff and capsized. Too much beam and too little hold. Our fishing fleet needs reforming quite as much as our yachts. The Stormchild's crew of seven would have perished but for the timely advent of a tug.

YACHT STOVES.—Cannelists and yachtsmen wishing to give the inventions of lit. Danforth a trial will find his address among our advertising columns. We will be pleased to report experiences with his stoves and fluids for the benefit of all sportsmen.

GREENPORT, L. L.—The following yachts are haid up at Greenport, L. I.: Schooners.—Estelle, Madeleine, Republic, and the Sharpic R. Q. Taylor. Stoops—Arrow, Coming, and Whiteaway, and Steamers—Julia and Patole.

ATLANTIC YACHT CLUB.—Annual meeting on Monday, March 18, next monthly meeting feb. 18. The annual matches will likely be fixed for June 17, with the customary spring brush down the bay on Decoration bay.

GWENDOLEN.—Mr. Cobb's Boston sloop has received 4,520 pounds of iron on the keel and McManus & Son are to give her a new shift of sails.

The Williamsburgh Athletic Club, of Brooklyn, E. D., hold their first annual winter meeting at the American Institute Hall, corner of Third avenue and Sixty-third street, N. Y. City, Feb. 21 and 22, commencing Tuesday, at 8 P. M. Open to all amateurs. The principal event is a 24-hours race, go-as-you-please, with six prizes, namely, \$100 order, \$60 order, \$40 order, \$25 order, \$15 order, \$10 order. A special prize to the competitor beating the best American 24-hour record (amateur) for a square heel-and-toe walk. There are also 75-yards, 600-yards, and 1-mile runs, and a 2-mile walk; all handicap. An entrance fee of \$5 for 24-hour race, and 75 cents for all other events is required. Entries close Feb. 14, for handicap events, and Feb. 17, for 24-hour race. No boys will be allowed to compete. The number of half grown and wholly unfit boy competitors at athletic meetings has been one great objection, and we are glad to see the W. A. C. taking the initiative in so important a step. The club is growing and enterprising and destined to make a name for itself in the future. It already has as members some of the finest walkers and runners in the country, and their number is constantly swelling. All communications should be addressed to Secretary W. A. C., corner Wythe avenue, Penn and Rutledge streets, Brooklyn, E. D., N. Y. THE WILLIAMSBURGH ATHLETIC CLUB, of Brooklyn, E. D.

New Glascow, Nova Scotta, Club.—The annual meeting of the New Glascow Rod and Gun Club, was held on the 12th ult. The following officers were elected for the coming year: President, W. B. Moore: Vice-President, H. J. Sutherland; Secretary and Treasurer, J. H. Cavanaugh; Exceutive Committee, Jas. Frazer, T. Cantley, D. M. Fraser. During the year the club has attained a suitable ground for shooting situate on Merrigomish Harbor, well known us the best place on the coast for wild fowl in the spring and fall. The club have erected a fine building for a club house and furnished it complete with all the requisites, boats, decoys, etc., and the geess and brant may expect a lively time in April.—Globe Sight.

The Piedmont Association's Work—Lynchburg, Va., Feb. 4.—The Piedmont Fish and Game Protective Association, whose headquartees are in this city, paid last year bounties for 372 hawks and owls killed in the five counties composing our district, and still "Bob White is not happy." We have now at least ten inches of snow, if the weather moderates and the snow goes off quickly all will be well, but if the snow lies long on the ground our bird crop will be very short.—Dieno.

A HUNTEM PIEE.—The Crown Prince of Prussia has a hunting pipe with a peculiar history. It bears upon its lid this inscription: "Grünhaus, April 18, 1869," being a place and day made memorial to him from his hawing there and then kalled a fine old buck, in the stomach of which was found about a hundred small pebbles. With several of these pebbles set in silver the neck of the pipe is studded, while the others form a chain attached to the lid of the bowl.

Windson, Conn.—Jan. 23, 1882.—A number of gentlemen of Windsor and vicinity met on Wednesday evening the 18th, for the purpose of forming a game club. The follow-

Ing gentlemen were chosen as officers of the club: Frank Bolles, Jr., President, Alfred Williams, Vice-President; W. H. Bower, Sceretary; E. C. Johnson, Treasurer. We have secured about 125 live quail, which we latend to set loose this spring. We have also put into the brooks thirty thousand trout. We are auxious to secure a law to protect the quail for the next two years, and it is the intention of the club to keep a good watch over the game in this vicinity so that our already depleted streams and woods shall once more furnish us sport with rod and gun.—W. H. Bower, Secy.

Bifle and Trap Shooting.

FOREST AND STREAM TOURNAMENT

FOR THE SHORT-RANGE CLIAMPIONSHIP OF 1882.

FOR THE SHORT-BANGE CLAMPIONSHIP OF 1832.

THEST prize to be ten monogram medials, presented by the Forest AND STREAM AND ROM AND 6133. Necond prize 50 per cent. of entrance fees; third prize, 39 per cent.; fourth prize, 39 per cent. of centrance fees; third prize, 39 per cent.; fourth prize, 20 per cent. Open to team from any organized ritle club.

Conditions—Teams—Each team shall consist of ten men. The teams participating must be composed of members of the various clubs which they represent. Ritles—Limited to ten pounds in weight; standard of the control of the various clubs which they represent. Ritles—Limited to ten pounds in weight; standard of the control of the various clubs which they represent. Ritles—Limited to ten pounds in weight; standard of the various clubs which they may desire. Xuniber of Shois—Ten by each competitor. Position—On-hand. Targets—200-yard targets, according to the regulations of the N. R. A., reduced in proportion to the range at the gallery. Practice—Mo practice allowed on the day of the match. Entrance Tee—Free dollars to be gaid at the ordice of the Poinser ANS STREAM.

N. R. A. relating to teams.

The above tournament will be shot during the unoth of March and will be in many respects similar to the contest carried on during the winter of 1879 under the direction of this paper. The intention is to permit the team captains to fix upon a satisfable gallory in which to have the records made, and there ought to be at least at dozen teams confending for the mastery and the elegant trophies now under preparation. The dates of dosing the entry list and of opening the match will be given in a inter issue.

PISTOL SHOOTING BY WOMEN.

PISTOL SHOOTING BY WOMEN.

THE use of small arms by women is not a subject on which statistics are resultly accessible, but that there is a great deal of it there is no doubt. Pretty revolvers have a very entiting effect on some of the fair sox, and while the majority of pistols and revolvers owned by them are regarded meaely as ornaments, there are cases where excellent marksmanship may be shown. Some ladies ladulge in pistol practice in their homes, using revolvers of small calibre, and popping at sheet-iron targets. The wives of travelling men, who are absent from home sometimes a month, and perhaps three morths at a time, are also, as a rule, provided with trustworthy revolvers for the insband is away for long periods, not only lats a revolver decorning her bureau top alongside of her toilet-set, but carries a small, 22 calibre "pop" against the top button of her corset. Actresses are seen to have a peculiar pondent for pretty and gleaning pistols. The fact will be recalled that when a well-known and veracious newspaper man went to interview the Polish artist, Modjeska, at the Indell House in St. Louis, during her first engagement there, he interrupted her while she was indulging in the pleashing but perions done, in the same western city, went one day into a shooting gallery, and made a score with a swinging target and in knocking clay junes to pieces that would have caused Wid Bill to a shooting gallery, and made a score with a swinging target and in knocking clay junes to pieces that would have caused Wid Bill to spin around in a wild dance of delight.

A few visits about among the five-arm shops where a retail business is done, shows that the buying of pistols is not infrequent. Said one reverse that we have caused wild Bill to spin around in a wild adnee of delight.

A few visits about among the five-arm shops where a retail business is gone, shows that the buying of pistols is not infrequent. Said one sive patterns. For lineance, a lady who made a purchose a few as good in every respect for St. but wi

have as good if used, but only a very insignificant percentage are everused.

Appropriate the subject comes a story from the 36. Louis Chomicle
Appropriate the cow boys of the West and telling how they used frequently to shoot at targets in company with their sweethearts, in the
shooting the girls masking sometimes almost as good a score as the
men, and the yells that would rend the air as one's favorite hady
would split the builtet on the half doltar as if reld toward the ground
would have done justice to a border score. Nor were the young ladies
behind them in equestrainsing, a certain Miss Ryan, in particular, often
boasting that she could drop the micket as often in the race as any of the
"nicket race." A nicket or other small coln is placed in the forb of a
ree, about the distance from the ground that a man's shoulder would
be while on horseback. Each party has one shot at it as he flies by on
his horse at full speed. The ladies take their regular turn, and Miss
Ryan has been known to drop the nicket there gould run, and Miss
Ryan has been known to drop the nicket their regular turn, and Miss
Ryan has been known to drop the nicket there would a server the server.

THE INTERNATIONAL MATCH.—It is now practically settled that a team of American guardamen, selected from the competing aspirants from all the States maintaining an organized militia, will shoot an international military match with the British volunteers, at Whabledon, in July next. In syste of the general luterest which has always been felt in the result of the international long range matches with target riches, the military contest will be far more important than any other match yet shot, for the reason that it will afford a fair opportunity to estimate the setadiness and efficiency attainable by the best men in what is really the great sulfainty reserve of both countries, and will give, at the same time, an excellent test of the merits of military

rifles of various patterns used in England and the United States. The conditions of the contest are singularly thereof and free from teclosticalities under which disputes or dissatisfication might arise. Each country will be represented by a team of twelve men, who will should in uniform and with any military broach-loading rifle and, seible under English rules, which, if may be remarked, will exclude nothing but such thoroughly amountous and unprofessional features as filed wights, while gauges and other "improvements" which, though permitted in some of the Creedmoor contests by National excitation, are tablely aspirants for places on the American team are to complete such by september of the Creedmoor contests by National excitations, as the American team should be chosen without regard to sibrte line, locking only to superior individual marks handship and ignoring the optimization whether the highest scores are made by a dozen men from one State or by one man from each of a dozen States. Formaylvaria unifity and the contest of the contes

to reach the covered position.—Plat. Transis dira. 25.

BOSTON, Feb. 4.—To-day there was quite a large attendance of riflemen at Walnut Hill to compete in the several matches which opened so finely a week ago. The sun was obscured and the light of the generative for as the previous week but other elements inderenged balled the marksmen. The wind was from the southerst, and at the balled the marksmen. The wind was from the southerst, and at the mass very trying. About 239 o'cleak the snow began to fall, and at our lime was so thick as to almost prevent the targets from being continued was so thick as to almost prevent the targets from being continued with this was the fact that the wind blow the snow from the eyes of the men just as they were about to pail "forces, and some misses were the result. In the Creection match, by It clareston driving with 40, while Messrs, Anson and Burt each as ored k, which was considered good. The score in detail a given of the best shots:

READ

A HANDSOME JOURNAL.

The Forest and Stream is out to-day in a The FOREST AND STREAM is out to-day in a handsome new dress, and easily takes its place among the most beautifully printed journals of the day. The editors had a lively scrimmage last Tuesday morning removing their property from the office, which, it was thought, must be destroyed in the free; but they escaped with nothing more serious than a thorough cold water drenching, and of cold water they profess not to be afraid. By the of field adventure we have seen in the last ten years is the sketch, "A Wet Week in Wisconsin," In this week's FOREST AND STREAM.—New York Commercial Advertiser,

WHAT

FOREST AND STREAM, which was not burned ent last Tuesday, though the fire came nearer than was pleasant, is out this week in a new dress, at the opening of its eighteenth volume. This thoroughly admirable sports-man's journal contains twenty pages of con-venient size filled with reading matter always Fresh, spicy and interesting. This paper was one of the first to discard the old style of waiting for "exchanges," to chronicle sport-ing events in other States and its liberality in specially reporting all matters of interest, no matter where they occur, has greatly increased its usefulness. The correspondence of "Nessmuk," "Seneca," "Chipmunk," and other old contributors always abound in interest.—Brooklyn Daily Times, Feb. 3.

SOUND, READABLE, INTERESTING, INDESPENS-ABLH.

This staunch old paper maintains its excellence. In fishculture and natural history it is, perhaps, without a rival. In every de-partment of field sports it is sound and always readable and interesting. To any gentleman of taste and culture it is worth certainly more than \$4 a year. To a natural-is and sportsman it is nearly indespensable. We have read it constantly since its founda-tion, and there has never appeared in its columns anything offensive to the most sensitive. We hope it may continue to receive the support it so well merits, and that the field of its useful influence may be co-extensive with human civilization.—Southern Planter, Richmond, Va., Jan. 15.

PRFSS

IT IS SUPERB.

FOREST AND STREAM entered upon its 18th volume February 2nd, which occasion was celebrated by donning a new dress through-out. Judging by the eagerness by which this journal is sought by sportsmen, we conclude it is the best sportsmen's paper published. In its new dress it is superb .- Lowville, (N. Y.) Times, Feb. 2.

SAYS

IT LOOKS REAL FANCY.

The Forest and Stream comes out with the present issue in a new dress entire. looks real fancy.-Standard, Montgomery, (N. Y.) Feb. 3.

This standard production promises to be better than ever this year, and should be in the hands of every sportsman.—Waterloo (Jowa) Courier, Jan. 25,

US.

SEA AND RIVER FISHING.

DIDN'T KNOW IT WAS LOADED.

THE New Jersey idiot, to whom we referred some time since as having shot a young girl "by accident" with a gun which he did not suppose to have been loaded, was very properly convicted last week of "atrocious assault and bat On Monday last he was sentenced by Judge Woodruff, at Paterson, N. J., to pay a fine of \$500 and the costs of the prosecution. Besides this, the prisoner has been confined in jail since last October, and has thus had abundant time to meditate upon what he has done. The very light sentence imposed is to be explained in part by the fact that the young lady who was injured by his stupid carclessness is recovering. There is still pending against this young man a civil suit, in which the damages are placed at \$2,000. Until this is tried, it seems probable that Wolfe will continue to inspect the outer world through the gratings, as he is unable to furnish bonds for his appearance.

We regret to have observed that, in the community where this deplorable and criminal act took place, considerable sympathy is expressed for the offender, and some efforts have been made to lighten the weight of the judge's sentence. Sympathy, of course, we feel for all criminals, and that any one should commit a deed that is wicked is, undoubtedly, much to be deplored; but our sorrow and pity for these wretches can hardly be expected to take the practical form of abolishing punishment for their misdeeds.

It is satisfactory to know that Judge Woodruff promptly committed to jail a friend of the prisoner who applauded, under the mistaken impression that Wolfe had been found guilty of simple assault and battery. On the other hand, the action of eight members of the jury in the case, who petitioned the court for a lenient sentence was decidedly improper. Their interference after they had given their verdict was out of place, and, while they then had just as much interest in the case as any other citizen, and no more, the fact that they had served on the jury should have made them especially careful to avoid meddling in the matter after it had passed from their hands. The place for them to have decided as to the degree of the crime, and hence, inferentially, as to the character of the sentence to be pronounced, was in the jury room, where the matter was wholly under their control. By this subsequent interference they stultified themselves without benefiting the prisoner.

It may be hoped that the result of this trial will have a salutary effect on the class to which Wolfe belongs.

SHALL WE HAVE A MATCH?

T does certainly begin to look as though the International Military Match was to fall through. Weeks have now clapsed since the receipt of the conditions from the sub-committee of the National Rifle Association of Great Britain. Those conditions were amended in two points, one having reference to position at the shortest ranges and another dis carding the requirement which would put the American rifies to the necessity of a severe proofing test. These amendments, when submitted by cable to the senders of the challenge, were at once acquiesced in by them, and everything looked lovely for a fine, fair contest between the Military of our country and the Volunteers of Great Britain. It was the one match which everybody was looking forward to as certain to be fought sooner or later. Long-range shooting may be very exact and severe as a fine test of the handicraft of our armories and of the ability of a handful of men who make shooting a study and a hobby, but to the mass of the people these marksmen were regarded merely as enthusiasts and having nothing which gave them any hold on the sympathies of the general public. The matches, when fought, roused a great deal of popular excitement, and remained a nine days' wonder, and then interest in them died out. The generation of American marksmen who had fought and won the great contests, left no progeny, and to-day long-range practice in this country does not number a hundred devotees. The series of matches which it was hoped would be inaugurated when the "Palma" was set up as a prize, came to an abrupt termination simply because it was shown beyond a doubt that we were the better gunmakers, and that the Brit-ish marksmen were too much set in their ways to be subjected to any improving influences. The defeated marksmen stubbornly accepted their discomfiture, rather than gracefully give up their old weapons and ways for the ideas and methods embodied in the American arms and system. The great apology made for these matches when in progress, was that these small bore rifles enabled many points to be tested which could be turned to advantage in the making of military arms, and this class of arms is, after all, the one for which ranges are established. The target rifle is a toy as such; and if the target rifle began and ended in itself, then little loss would result if every range in the country closed its gates to-morrow; but the aim of rifle practice is to make soldiers. Smallbore work was acceptable and endurable only so far as its lessons could be made profitable in improving the arms placed in the hands of soldiers, and the records of small-bore practice became available in guiding the ball practice of the men of arms It followed then naturally that the small-bore matches

should give way in time to military contests. These would more really represent the endeavors of the majority of those who patronize the ranges. A comparison after entry lists on American as well as English ranges will show that where there is one shot fired from a long-range target rifle, one hundred are fired from the military weapons. There are scores of ranges on the other side given up exclusively to military shooting, and yet from one course or another there was no successful effort to bring this great volume of military marksmanship to express itself in the form of a challenge to our American shooters. At last finding that success was as far apparently as ever from their grasp, the British Association resolved on putting their great army of volunteers against the militia of the United States which is a formidable body, at least on paper. It would be thought that such a proposition would only need to be suggested to find a ready response from the American shots. The British marksmen showed their willingness to meet all reasonable demands by at once changing the conditions when certain points of objection were pointed out. But just then crept up the shadow from the jealousy of the managers. They were not willing to have a match for its own sake, but there must be a certain amount of personal vanity gratified before these socalled promoters of rifle practice are willing to lend any aid to the project. To send a team abroad for a match on the English ranges means a great deal of preliminary work and very little of the popular flattery and adulation which the managers would be able to draw about themselves in case a match were shot on this side the water. If it be the intention of those having the matter in charge to force themselves into prominence in this way, the sooner they retire the better. If there is no such intent then to insist upon a guarantee of a return match is simply to all appearances a method of wriggling away from the defeat which so many of the fainthearted ones see in store for the team that may try conclusions with the English military marksmen. These American managers profess to be very solicitous that every fostering aid

terest in this country, but have they calculated the chance of a refusal on the part of the British managers to agree to the guarantco demand? Such a refusal, which is very likely to come, would leave for us either a very undignified retreat or a dog in the manger attitude, and work no end of mischief to the growing feeling in favor of rifle shooting here.

It is nonsense to pretend that the public is not willing to

sustain such a match. We are justly proud of our National Guard and believe that in their ranks the very best of military shooters may be found. That we can produce a weapon better than any foreign one goes without question, and there fore, while there is a certain amount of uncertainty regarding the issue as of every other event, yet the prospects are good enough to warrant us in making an effort in the contest. It is not yet too late for those, who make the absurd demand for a guarantee of a return match, to withdraw from their untenable position, and in place of filling the role of obstructionists, turn to and lend their aid in forwarding the preliminaries of the match. Will they do it?

SIGNS OF THE ZODIAC.

IF angling were an exact science it would have few charms. We would then know all that was to be known about it, and the delightful uncertainty that now envelops a proposed trip would be lacking, while in its stead we would have a set of calculations showing the result of a present departure or of its postponement for a week. Consequently, many of those enjoyable days, when the fish were not in the humor to partake the proferred hospitality, and the trip was its own good reward, would be lost. The angler always tries to forecast his luck by glances at the sky, observing the wind, and, if he be an elderly one, he is often full of

Now, the signs of the zodiac seem to have gone out of fashion for some reason, but as they have done good service in the past, there would seem to be no good reason why they may not come around again and be of use in the future. Astrology has been ruthlessly pushed aside by her son and heir, Astronomy, and it is no longer the fashion to adorn our almanacs with the zodiacal signs which delighted our grandfathers, except in those reliable pamphlets designed for agricultural purposes. The farmer plants by the "signs," why may not the angler angle by them?

After long years of study in this direction we have pre-pared the following formula, having, as we write, a copy of Company, before us, with the plate showing a man surrounded by the "signs" looking like Adam naming the First we have:

Aries the Ram. Sign in the head and face. Head your boat for the nearest fishing ground and don't ram into the face of the bank. Headwork pays, if you don't do too much of it. Motto: "Be sure you're right, then go ahead."

Taurus the Bull. The picture shows him lying down. In

crossing the lot where he is pastured it is better to go around it. Don't take him by the horns. In fact, beware of horns of any kind, they are alleged to bite like a serpent and sting like a "lightning calculator." Bullheads should bite now.

Gemini the Twins. The original Greek was "jimminy,"

for Socrates said "By jimminy!" when Xantippe presented him with a pair. Don't use the expression rashly on hooking a snag, but sit down and call to mind the fact that two of a kind beat nothing, by a large majority.

Cancer the Crab. Now, go down to Fulton Market and lay in your "shedders." Motto: "What shadders we are, and what shads we pursue." Crab apples probably represent the acidity of temper with which your bitter half, the partner of your jaws, will look upon your return with those new trousers all wet and only one fish of two ounces.

Leo the Lion. As anglers have been falsely accused of underrating their catch, and evil-disposed persons might pun

upon the "sign," we pass it.

Virgo the Virgin. This is evidently a misprint for virago, for the female is sitting down and has a branch in her hand, and by her countenance we judge that she has an intention to apply it below the waistband of the trousers of the boy who has lost his shoe in the swamp. Boys, you had better stay at home while the sign is here.

Moral: Weigh your fish in these Libra the Balance. scales, or their own if handier, and don't liebra about their avoirdupois, especially about that largest one that got away.

Paste this in your hat.

Scorpio the Scorpion. Here the sign is in "secrets." Now, if you have a secret fishing place, where the fish are large and always hungry, don't keep it secret any longer. Share should be extended to the not over-strong rifle shooting in- it with your brother anglers, who will take pleasure in going down in squads and taking them out of the wet. Secret baits and charms, such as oils, scents, etc., are not half as good as spitting on your bait.

Sagittarius the Bowman. The man is on one knee and is drawing the long bow. Anglers never draw the long bow. That is an old slander on the craft that we must live down by underrating our powers and surprising the slanderers by showing a big string after telling them that we had poor luck, and are not first-class fishermen any way.

Capricornus the Goat. When your friend has a big trout hooked, remember this sign and advise him loudly to do what the goat is doing, "give him the butt." The goat, you may notice, has two horns, like the bull. Don't take but one The goat, you may Eat your lunch on the grass without the goat—you can do without the butter.

Aquarius the Waterman. He appears to have a jug and is pouring out what is alleged to be water. Don't take him along. Too much of a good thing. If he upsets his jug in the boat you may realize what a fisherman's luck is.

Pisces the Fishes. These are the fish that you are to buy at the market, on return, and the big one will do to illustrate the wonderful elasticity of your new eight-ounce rod, "The tip rapped my knuckles several times, and I thought every moment the strain would be greater than it could bear." etc. You know how this is to be worked in without prompting; so, as there are no more signs in the zodiac, we must content ourselves with the old dozen, until in the march of science new ones are discovered. But that anglers will in future consult the calendar in the light of our revelations there is no room for doubt.

A QUESTION IN ETHICS.

HETHER to "shoot em settin" or not, appears now to be troubling the minds of a number of our correspondente The decision of the question as to whether or not it is permissible to shoot a ruffed grouse out of a tree, is a delicate one in the ethics of shooting, and must of course, be left to the consciences of individuals. Yet, for the sake of the example to younger and less advanced sportsmen it seems searcely desirable to advocate this course, and we imagine that most of our readers will sympathize very heartily with the sentiments expressed by "Look East."

If we may shoot grouse out of trees, why may we not with equal propriety kill quail on the ground? It is difficult to see the difference in morals between shooting at the huddled bevy about to rise, and at the slim, graceful bird which stands with erected crest upon the limb of the hemlock above us. Perhaps two or three times in a season's shooting one is fortunate enough to behold the very pretty sight of a woodcock or a quail crouched on the ground just before the dog's mose, but we imagine that to very few of our readers would it occur to try to shoot the poor little thing's head off in order to make sure of securing it.

Most of the men who carry a gun desire to become good wing shots, and this end is certainly not to be attained by pot-shots at sitting birds, whether on the ground or in a tree. Then, too, when a man brings in his bag of birds, it is assumed that he has killed them while they were flying, and if as a matter of fact, he has shot a part of them on the ground or in a tree, he is sailing under false colors, and unless he states the way in which his birds were captured, cannot help feeling uncomfortably about the matter.

Although we are all of us eager to kill our birds and to make good bags, it must be remembered that the men who form the great majority of the readers of Forest and STREAM, do not go shooting for the meat that they can secure, but for the excitement of the sport and the calmer, but not less enjoyable, pleasures of the concomitants of a day's shoot-The opinions of such men have, as they should, weight in the community, and it is through them that we must hope to educate public sentiment up to a point where the game laws shall be respected and enforced, and game shall once more become so abundant that there may be shooting enough in its season for all who love the sport. Good bags, plenty of birds, are desirable to such men primarily as evidences of their skill with the gun, and not for the price that the game will bring in the market, or for the dollars and cents by which ts capture may reduce the monthly butcher's bill.

The question is one which each man must decide for himself. There are many individuals representing the best class of sportsmen, who feel themselves justified in shooting the sitting grouse, but it is no doubt higher art to confine oneself wholly to wing-shooting. To say, however, that the man who shoots from a tree is necessarily a pot-hunter is to take a position that is by no means tenable.

The difference between the so-called pot-hunter and the man who shoots for recreation lies in this, that the former shoots for meat and the latter for the innocent and healthful excitement of the day afield. The former kills his birds as he would butcher a hog, while to the latter the killing is only one episode of the day's delights. The meat hunter will kill all that he can, his greed knows no bounds; the self-respecting shooter is satisfied with a fair bag. The wealth, social standing, and education of an individual afford no indication as to which of the two classes he belongs in. We have known men of high culture, whose equipments excited our admiration, who were the veriest meat-hunters; while others, who can barely read and write and who still carry most ancient muzzle-loaders, have commanded our unqualified respect by the wholesome and manly view which they hold of game and the way in which it should be brought to bag.

BATTLE OF PORK AND BEANS.

ARY a nibble, or practically that, had been the result of our piscatorial efforts for the day, but the wading and tramping had whetted our appetites until our stomachs could well believe that our throats had been cut, and a formidable party of coronaudizers it seemed to be as we tramped into the dining-room.

It was a thoroughly organized, well disciplined force, composed entirely of veterans, who had seen service in the Rocky Mountains, along the shores of Barnegat Bay, on the Mississippi, in the Adirondacks, and in New York boarding-Veterans we were, who never quailed when the order came to attack our rations.

Our leader was a warrior bold, and armed with knife and fork or tablespoon he feared no foe. Dyspepsia might hurl its legions across his vomitory, but carefully he'd masticate them all, "chew them up," and leave no sign. His capacity was as sublime in the hour of plenty as it was anxious in the moments of scarcity.

The scene was a large square room, the ceiling formed of unhewn logs, blackened by the smoke from the open hearth, but the floor shone like polished mahogany, and every pail and pan, scoured to a lustrous brightness, helped to make more glaring the contrast between peace and the impending battle. The wainscoting on the side of the room opposite the fireplace was regularly pegged with supports for rods, reels, landing-nets and creels, and well-filled were they with bamboos, lancewoods, greenhearts and ash, every rod of its kind first-class.

The commander of the defence was "fat, fair and forty." Captain Cuttle would say of her, "she is a woman as is a woman," and she handled her forces like the veteran she was. Every detail was under complete mastery, and the experience of a thousand former victories gave her the confidence that assured her final success.

There was a sayory smell pervading the apartment, a smell of fragrant coffee, of delicate trout, of flaky biscuits, and crispy spuds, not only exquisitely served, but enough to have victualed a famishing regiment. There were no lightweights like ginger snaps and pies marshaled to oppose our onslaught; but the choicest substantials were ready to do battle with our capacity and digestive organs.

We soon found the main body we were to attack. It consisted of two immense platters of trout, flanked on either side by crisp potatoes, flaky biscuits and golden butter, the rear well guarded by a pot of steaming Mocha, red-hot, and burning to be brought into action.

It was a powerful and admirably equipped force to attack, but after a little preliminary skirmishing the battle became general all along the line, and the whole room resounded with the rapid and continued clatter of knife and fork, of cup and saucer. A few well-directed shots caused a wavering in the centre, and as one large platter beat a sudden retreat our men turned fiercely toward the remaining one, which they attacked in grand style. This platter showed signs of wavering, when fresh reinforcements from the biscuit and coffee corps were ordered up, and for a time the fortunes of war were evenly balanced. We stubbornly held our positions while the fray thickened, but as potatoes and bread and coffee fell victims to our prowess it promised to to be a Waterloo for the table. We had almost achieved a complete victory, when there reappeared on the scene platter No. 1, which had been halted in its retreat, reorganized and brought once more into the thickest of the fight; but it soon followed its companions to annihilation. Victory was within our grasp. She was hovering over us, just folding her wings and slowing up before alighting on our banners, when unseen and unsuspected there appeared another battalion ready to pour an entilading fire upon us. A huge dish of pork and beans had been ordered up, and came at doublequick through the wood shed door,

It proved to be our Blücher. Our men became surfeited Tyro had been struck in the stomach two minutes before by a volley of pancakes and retreated before the main body fell back. A bottle of pepsin preserved his comfort and allayed The rest of us made a faint show of resistance, his pain. then laid down our knives and forks and surrendered, drawing what smoke and consolation we could from our pipes, which, through the generosity of a brave conqueror, we were suffered to retain. MILLARD.

SAWDUST IN MILL STREAMS .- A decision bearing on this point has just been rendered by the Vermont Supreme Court in the case of Zadoc H. Canfield and others against Caleb Andrew and others, which is important to mill-owners and riparian proprietors. The court decides that a mill-owner or manufacturer has no right to dump into a stream upon which his mill is situated sawdust or any kind of waste, except what is absolutely and indispensably necessary in the beneficial enjoyment of his water privilege, to the injury of others below him on the same stream. A perpetual injunction and decree of ascertainment of damages are granted against the defendants in this case. The opinion of the court is delivered by Chief Justice Royce.

NEW HAMPSHIRE is much excited over her new crow law. A bounty is given for the destruction of these birds, and the law provides that "the ears" of the crows shall be cut off as evidence, before the bounties are paid. So far no ears have been presented.

HATCHING CODFISH.—A short time ago Maj. Ferguson, of the U. S. Fish Commission, conceived the idea of obtaining ripe codfish eggs at Fulton Market, New York city. He saw that if this could be done that they could be obtained later in the year than on the coast of Massachusetts, and also much nearer the base of winter operations of the commission. On Tuesday last, 14th inst., two men of the commission, Messis, Wm. P. Sanerhoff and Wm. Hamlen, arrived at the market where Mr. Blackford had arranged to have freshly caught cod from Fire Island in readiness for them. were present and saw the operations. The men were prepared with appliances for taking the eggs to Washington in First, on flannel trays; second, in hogs' bladders; and third, in water. The eggs will be taken to the old Armory building where fresh sca-water will be brought daily, and if not successful, then the lot will go to Old Point Comfort. If this plan is practicable, it will be of great advantage to get spawners in New York and hatch them near here instead of up the coast farther. The main points will be to know if the eggs taken so late are good and will impregnate, and if they will stand transportation by rail The men took over four million eggs. or water.

AN ALEANY MATTER OF INTEREST.—Senator Boyd, at Albany last Monday night, presented a petition from Henry Bergh, with a bill prohibiting the trap-shooting of birds, and providing that it shall be a misdemeanor to use any live bird or animal for the purpose of a target; also to rent a room, yard or building for such sport. Nothing in the bill shall be construed to relate to the shooting of any wild game in its wild state. The petition cites the Coney Island tournament of last summer as "a scandalous scene," and Mr. Bergh draws from his fertile imagination a terrible state of affairs subsequent to the meeting; he alleges that a pestilence was threatened from the decomposing blood and bodies of the victims. As we have before said, there is a vast difference between a quiet private trap-shoot and such a wholesale slaughter and money-making scheme as that which last sum-mer received the well-merited rebuke of an outraged public sentiment. It is exceedingly improbable that Mr. any one else, would have attempted to have a law passed against the trap-shooting of birds, had not the Coney Island tournament led to such a step.

An Excursion to the Pacific coast will be made in one of the Worcester Excursion Car Company's cars, leaving Worcester, Mass., April 20th. The trip will extend through two months, and the route includes all of the points of interest on the Southern, Central, and Union Pacific roads. Full information regarding the excursion may be had upon application to Mr. Jerome Marble, Worcester, Mass.

DISGUSTED GUNNER (who is missing the ducks right along as they come up to his stools) soliloguizes: "I can't see what is the matter; I think my gun must need choking." EQUALLY DISGUSTED TENDER (sotto voce): "Your gun-or you?

Muzzle vs. Breech.—Several letters on this subject. muzzle-loading rifles vs. breech-loading, will be published in our next issue.

The Sportsman Tourist.

PISECO AND T LAKE FALLS.

BY THE REV. HENRY L. ZIEGENFUSS.

A CROW-FLIGHT of one hundred and seventy-five miles of a county sixty miles long by thirty wide, where arable land can be purchased for fifty cents an acre; where there is not a single mile of railroad or canal; where there is no banking house of any sort; where, as a rule, there are no locks to the inner or outer doors of houses; where the Board of Supervisors reported for the past year a county tax of seven thousand dollars, and taxable personal property to the amount of only eight hundred and fifty dollars; where there is no poorhouse, and where the jail usually stands empty. In the southern portion of this county lies Piseco, a lake of remarkable beauty, perhaps the most picturesque that can be found in all the Adirondack region. It has a length, running from the northeast to the southwest, of somewhat more than six miles, with an average width of about one mile and a quarter. This superb mirror of nature is held by a magnificent setting of emerald. On all sides the dark green forests come down to touch these waters, forests into some of which one may press on for days and days without finding any limit or any trace of civilization; only the primeval haunt of the wolf, the panther, the lynx, the bear, the deer, the otter and the marten. Overhead on leisurely-lifted wing sweeps by the eagle, the osprey and the crane, whilst loon and owl fill night with the weighest cries. All around the lakesthe wilderness. the marten. Overhead on leisurely-lifted wing sweeps by the eagle, the osprey and the crane, whilst loon and owl fill night with the weirdest cries. All around the lakes the wilderness comes to the water's edge, two small places alono being excepted. Midway down on the east side is a clearing of about one hundred acres, on which, surrounded by three or four smaller dwellings, stands Walton Hall, the fishing lodge of the once famous Piseco Club.

The Club was organized in 1842, with the following officers and members:

and members:

President, Henry Vail, Troy, N. Y.
Vice-President, George B. Warren, Troy, N. Y.
Secretary, Alfred Brooks, Boston, Mass.
John B. Duane, Schenectady, N. Y.
George W. Bethune, D. D., Philadelphia, Pa.
Isaac-Gibson, New York city.
George Trott, Philadelphia, Pa.
So were they captivated by the beauty of the lake, the grandeur of its surroundings and the abundance and excel-

lence of its fish, that they resolved to make an annual pil-

lence of its fish, that they resolved to make an annual pilgrimage to this region.

The lake was so named by an old-time surveyor, (Joshua Brown) after Pezeeko, a friendly Indian chief. The first white settler at this place was Shadrach Dunning, who came hither in 1827. In the year 1884 arrived Rensselaer Van Rensselaer and David Woolworth, who were soon followed by Eli Rudes from Saratoga. On a beautiful headland that commanded a fine view of almost the entire lake the latter brill a loghouse, but a few rods from where Walton Hall more stored. now stands.

brill a lognouse, but a 1ew roos from where Walton Hall new stands.

The secretary of the club has left on record an account of their first arrival and reception at Mr. Rudes' primitive abode. If there was lack of comfort there was none of hospitality. "The family bed was given up, but when a light was asked for to retire with, they were informed that there had not been a candle in the house for a twelvemonth! Cornmeal, with the fish caught, formed their only food."

But the Piseco Club lacked not food or comfort after this first visit; for Brundage, the veteran stage driver, was wont for many a year to entertain his patrons with marvelous stories of the sayings and doings of those worthy disciples of Lzaak Walton; never failing to tell how it took one wagon to carry their meat and

carry the anglers and another to carry their meat and

drink

drink.

By the month of May, 1843, a comfortable frame dwelling, two stories in height, had been erected, with the ready cooperation of Mr. Rudes, and duly named in honor of their
patron saint. For about ten years these rare spirits gathered
here annually, at the end of May or by the beginning of
June. En that unpainted, weather-worn, grim-looking abode
what brightness has flashed; what thoughtfulness of discussion been there displayed, with sharp salities of wit and quick
reparter; what geniality and mirthfulness, as the flame
roared tip through the capacious chimney into the frosty air,
and the shadows danced morrily on the wall! A sweet mem-

repartee; what geniality and mirthfulness, as the flame roared tip through the capacious chimney into the frosty air, and the shadows danced merrily on the wall! A sweet memory these men have left around the waters they loved so well. Their priaise is often in the mouths of men, and to this day they will repeat texts, comments and illustrations which Dr. Bethune made use of thirty-five years ago, showing what a remarkable impression he must have made.

The entire bearing of these brothers of the angle came as a sort of revelation to Piseco, their gentle malliness contributing an abiding impulse for good. They were gentle men; anglers, not fishermen; men of skill, patience and courtesy, not of mere cunning and rude force. The difference has been well stated by one who had seen much of both classes: "An angler, sin, uses the finest tackle, and catches his fish scientifically—trout, for instance, with the artificial fly; and he is mostly a quiet, well-behaved gentleman. A fisherman, sir, uses any kind of hooks and lines, and catches his fish scientifically—trout, sir, something like a gunner."

"Tis true these men of Walton Hall did not disdain to sit in the stern of a boat, each with his guide at the oar, and troll over the lake from top to bottom, but they were true anglers withai. They took no undue advantage. Their tackle was of the most delicate, demanding infinite skill in the successful taking of the fish. Into the golden shiner used as bait they fixed a gang of hooks so small that the bend would "scarcely allow the barrel of a quill to rest in them." With bits of steel so tiny, fastened to silken line by single gut leader from six to nine feet in length, they did angling with rod and reel that is worthy of the record it has received.

In Dr. Bethune's sumptuous edition of Izaak Walton's Connected and the success of the stem of sterile stem of the stem of the searce of the stem of the searce of the stem of the stem of the searce of the stem of the searce of th

with rod and reel that is worthy of the record it has received.

In Dr. Bethune's sumptuous edition of Izaak Walton's "Complete Angler" there is a detailed account of the work that was done at Pisceo from 1842 to 1847. For the statement of what occurred after the latter date we are indebted to the courtesy of George Trott, Esq., of Philadelphia, who, with Col. John B. Duane, of Schenectady, is the only survivor of the club. The data that Mr. Trott furnishes are taken from the Boston Transcript of February, 1856, when a series of articles entitled "Angling Incidents," appeared over the signature of D. E. N.—the secretary of the club.

Whilst reading the record, it is well to bear in mind that the lake trout of the Adirondacks, the true Saino confinis, seldom attains a greater weight than twenty-five pounds, the average not being over four pounds, thus differing gastly from the Great Lake trout, the Saino amethystus, (naymacush), which has frequently been taken from the Columbia River, weighing as much as sixty pounds. Haling a weight of seventy-five pounds," Norris says that it has been taken in Lake Superior weighing a hundred pounds, whilst Dr. Bethune places among his notes (I. p. 72) the report that this fish has been known to weigh one hundred and twenty pounds, and to measure in length more than six feet.

The following is the record of nine years' fishine:

The following is the record of nine years' fishing:

Year.	No. of Days.	No. of Anglers.	No. of Pounds.	
1842	9	Ŧ.,	829	12 lbs.
1843	9	3	7301/5	934
1844	7	6+	715	15 "
1845	11		1.019	716"
1846	9	5±	71916	141241
1847	7	8	38837	24
1848	8	61	70487	163/44
1849	12	7	8663	1312"
1850	- 8	6	383	
*One	e fishing only f	lve days. †One fi	shing only three	lays: two only
six da	ys. #One fishi	ng only six days.	Two fishing onl	v five days.

That is, an average of less than six men, fishing only five days. That is, an average of less than six men, fishing, on an average, less than nine days annually, succeeded in capturing in a period of nine years more than three tons of trout. Large quantities were kept on ice for transportation to the homes of the anglers, and the surplus was distributed among the dwellers around the lake. In 1845 several hundred pounds were sent by the guides to Saratoga, of which the historian says that 'mever, probably, were the bipeds of a watering-place so gorged with good fish."

Among the largest lake trout ever taken out of Piseco was one weighing twenty pounds and a quarter, which measured three feet, less half an inch, in circumference. In June, 1847, the president of the club killed a red-fieshed lake trout that weighed twenty-four pounds, the largest that was ever there taken by trolling. At 4 o'clock, on Friday morning, June 24, 1842, Timothy D. Warner, a native of Piseco, took a "laker," at anchor fishing, that weighed twenty-six pounds and eight ounces! In the records of the club this fish is always alluded to as the "Emperor."

But our heroes of the rod did not confine themselves to trolling for large game. Full well they knew how to cast the fiy. From the inlets that come down from Oxbow, Fall, Fly, and other lakes; from the little stream that passes through the 'Mar'sh' into Irondaquoit (vulge Gerundagut) Bay at the southern extremity, from the tortuous outlet, and from the foaming rifts and dark pools of the West Branch,

large quantities of brook trout were frequently taken, the contact with the outside world, and will doubtless be well weight of which is included in the figures that have been prepared to take their places in the world's battle when the given. In 1844, were taken in the Outlet, during one afternoon and the following forenoon, by one man, forty-four pounds of brook trout. In 1845 two members took fifty of Pisco, "It goes up, up, up—all the way up," as Lobb

pounds of brook front. In 1845 two members took may pounds in one day.

This could not so continue forever. Signs of scarcity having manifested themselves in the later years, and other places holding out greater inducements, the club was led, in 1852, to transfer its interest in land and hall to Mr. Rudes, whose son Daniel still holds possession. From time to time smaller and smaller additions have been made to the original building, thus withing it a various it as a value relaxonic assent. As long as there is room smaller additions have been made to the original building, thus giving it a rather telescopic aspect. As long as there is room anywhere in the house, the comer is gladly welcomed and well entertained at an absurdly low rate. But let no one go in the hope of rivaling the work from '43 to '50. Forty years of fishing have wrought many changes. Nearly all the inlets are at present protected by law. The lake trout are recither as abundant nor as large as formerly; still, great numbers are taken in May and June, though seldom of greater weight than six or seven pounds. During the months of July and August they are very scarce. At the Hall there is an abundance of mutton, lamb, poultry, beef and pork, but no trout.

is an abundance of mution, lamb, poultry, beef and pork, but no trout. In every direction the lake is environed by mountains of most graceful outline, whose sides are ever quick to catch the varying moods of the sky. Wonderful echoes sleep in their deep recesses. Glorious sunsets flame up over those western heights, kiudling mighty conflagrations, till the mountains glow and the lake becomes a sea of molten gold, flecked with purple and dashed with crimson.

All along the west side the mountains rise rapidly from five to eight hundred feet above the surface of the lake, which itself lies sixteen hundred and forty-eight feet above the level of the sea. Days of extreme heat are unknown here. The average temperature at 2 P. M., during the month of August last, was 75.3° F., the maximum being 85° F. The water that was drawn from the well was but eighteen degrees above ast, was 75.3° F., the maximum being 85° F. The water that was drawn from the well was but eighteen degrees above freezing. On the 12th of August, at 7 A. M., the mercury stood at 45° F., which leaves it obvious how comfortable were the morning and evening fires that were kindled almost deliv.

stood at 45° F., which leaves it obvious how comfortable were the morning and evening fires that were kindled almost daily.

Within a few years encampments have become numerous, being scattered all around the shores of the lake. The oldest, and the only permanent one, is that of Floyd Ferris Lobb. It is merely a rude bark shanty that he occupies, but how to make it comfortable both in winter and summer he understands to perfection. The last thirty-five years he has spent on and around these waters, over which he has rowed many an adept in angling, and out of which he has lifted many a ton of trout. The flute of Tenner and the violin of Lobb gave zest to innumerable gatherings in the years gone by. The bunden of three score and ten years he carries lightly indeed. Partial deafness makes conversation difficult, but, when the mood seizes him, he can pleasantly entertain his auditor, seasoning his speech with shrewd sayings, and a peculiarly dry and grim humor. He is kind-hearted, helpful, and generous to a fault. Whether he trails his line from Eagle Point to "Gerundagut," or rides patiently there at anchor, may his years be many more, and the winds ever propitious.

Half a mile north from Lobb's camp at Steep Rocks, where, too, are the summer abodes of S. R. Shepard, Esq., of Plantsville, Conn., and of David Palmerton, the guide, lies Camp Palatine, at the very "Tree Tops," whither the members of the Piseco Club daily resorted at noontide, to discuss the feats of the morning, the plans for the rest of the day, and the relative merits of the inevitable punch and chowder. Worthy successors to those noble men of olden time are these modern fugitives from the editor's sanctum, the doctor's and lawyer's offices, the artist's studio, and from the turmoil of manifold business pursuits. The doors of their cabins are ever open, and a friendly greeting awaits the caller. Good cheer is there, and never a lack of trout. These are men after Izank's heart, men of skill and perseverance, men "that are lovers of virtue, and dare

and dare trust in Providence, and be quiet and go a-angling."
Aside from that at Walton Hall, there is but one other clearing. This is at the head of the lake, where lie scattered about the forlorn remnants of the sometime village of Piseco. Because of the abundance of lumber, the cheapness of land, and the excellence of water-power, some one came here, about forty years ago, and, in an incredibly short time, erected a grist-mill, a saw-mill, a machine-shop, a hotel, a boarding-house, and half a dozen dwellings. The place was advertised as a modern El Dorado. It was not long before about two hundred and fifty persons were gathered here. But suddenly there was somewhat amiss; somebody had blundered, and the colony melted away as quickly as it had appeared. The sharp winds of many a biting winter have whistled through the skeletons of these immense structures.

In the four or five houses that still remain habitable may In the four or five houses that same remain and live twenty or twenty-five persons, whose souls are steeled against all enterprise. With but a single exception the dwellings are dilapidated and most untidy, and the occupants are in perfect keeping therewith. With truth could the guide are in perfect keeping therewith.

> "Once the red Indian here took his delights, Fished, fought and bled; Now the inhabitants are only whites, With-nary red."

We spoke of one exception. Just across the bridge that spans the little stream which flows through the clearing stands a small log house, a model of comfort and tidiness. Here lives George Youmans, an aforetime hunter, trapper and guide, with his thrifty housewife, an aged couple, whose unlikeness to all else fills one with admiration. The linen is white and spotless, the floor shines with frequent scrubbing, and on whiteware and glass is not a speck of lint. Here, as at Walton Hall, a few guests are occasionally entertained at the rate of five dollars a week, the use of boats being included. cluded.

cluded.

Education is not neglected at Piseco. On an eminence south of Walton Hall, stands a small structure, about twenty feet by twenty-four. As is the case with nearly all buildings in this region, there is no lock on the outer door, a thumblatch offering ingress to any passer-by. In the dusk of the evening we enter, Not a soul is there, but on the walls hang coats and aprons, and on the desks lie books and stationery undistributed. There are but tive desks inst enough to accommoand aprons, and of the dessis it cooks and stationery thicks-turbed. There are but five desks, just enough to accommo-date ten pupils. From May to November the school is open, with an average attendance of seven pupils. Here we are in the depths of the wilderness, but the maps hanging on the walls, and the histories and geographies on the desks, infli-cate that even these children, far removed from the centres of enterprise and of culture as they may be, are yet in close

contact with the outside world, and will doubtless be well prepared to take their places in the world's battle when the summons comes.

T Lake lies about four miles due west from the upper end of Pisco. "It goes up, up, up—all the way up," as Lobb said. Following a fair trail, with a line of blazed trees that is not yet so very old, the journey is much easier than one would, at first, be led to suppose. Still, the four miles seem to stretch out longer and longer till the lake is reached. To allow three hours for the four miles is not allowing too much. To trace out the T demands some alacrity of imagination. The horizontal top-line runs cast and west, the stem diverging northward not far from the middle. Along the former line, the southern shore, lies our course. It increases in roughness; deep ravines, tangled undergrowth and fallen trees constantly impeding progress. As we look over to our right the lake itself is not attractive. The water is low, warm and stagnant. Guides maintain that there are no fish of any kind to be found here; and yet, all along the line, numerous and recent traces of otter were found, and a fine specimen took to the water before our eyes. When there is snow on the ground their "sildes" must be very abundant. Hunting and trapping are the principal occupation of the natives during the winter. The woods are full of those peculiar little pens, made of stakes driven into old stumps or fallen trees, where the traps are placed for marten and like game. When we reflect that a prime pell of otter or marten is worth from eight to ten dollars, it becomes evident that trapping needs not be altogether profitless. As to hunting, it is sufficient to say that one Pisco guide alone killed thirty-six deer during the past season.

irapping needs of be altogether profitless. As to hunting, it is sufficient to say that one Piseco guide alone killed thirty-six deer during the past season.

The waters of T Lake find an outlet at the western extremity, to which direction they run till they empty into the east branch of the West Canada Creek. Along this outlet the advance becomes more and more difficult. It is safest to take the bed of the stream, although occasionally detours have to be made up the steep banks on either side. In the stream the journey is made by jumping, wading, slipping and gyrating; or by creeping carefully along the slippery sides, clinging to rocks and roots and bushes, till, at last, an abattis of fallen trees, a deep pool, or a precipitous waterfall, forbids all further progress. If we take to the woods the way is more arduous still. The pitch of the hills is very sharp, thickets are closely intertwined, rocks rise up on eyery slide, decaying trees of immense size obstruct the path, and the earth herself is treacherous, frequently letting the intruder slip thigh-deep down through centuries of decay.

The natural meadows, which are here called "flies," are always hailed with delight. Between the lake and the falls are three of these, the largest of which has a length of three-quarters of a mile, with an average width of iffecen rods. They are covered with a long, coarse grass, through which the deer usually have their "runways"—narrow, well-trodden paths, for which the exhausted wanderer is devoutly grateful. But even these have their drawbacks. Burrowing animals and underground rills are constantly making pitfalls by which the unwary are caught and worried and fatigued, if not lamed.

So the todsome struggle goes on, till at last a patch of

if not lamed.

So the following struggle goes on, till at last a patch of light is seen among the dark foliage of the trees. The stream widens; the rock beneath our feet is smooth as a floor; one turn to the left, and what a prospect! The rock-bed curves down before us into an abysmal chasm. A rock-bed curves down before us into an abysmal chasm. A mile across, mountain rises up above mountain, range upon range, shading away from darkest green to the most delicate gray in the distance. The depth is felt; the whole being is thrilled with dread and delight. Incredulity gives way to amazement. Over the hard, pittless, Eozoic rock-bed, the laughing waters rush down into the unseen below, six hundred and ninety feet!

Descent is made on the right side of the Falls. The soil is

Descent is made on the right side of the Falls. The soil is remarkably scant; majestic trees, from sixty to seventy feet in height, stand flat on the bare rock, their roots being covered by scarcely a foot of earth. The water is gradually denuding the entire mountain side.

The going down can hardly be called a going; it is rather one continued sliding, dropping, and plunging forward, over deep beds of embrowned needless of pine, till the bottom is reached. The valley is very narrow, not over fifty feet in width at this point. From each bank of the stream the mountains begin to tower upward. At the foot of the Falls is a beautiful pool called Snowstorm's Delight, so styled not because the daughter of winter loves here to disport herself, but because "Snowstorm" was the pet name of her that was beloved by him who named it.

but because "Snowstorm" was the pet name of her that was beloved by him who named it.

In mid-summer but little water comes down from the lake, but, in spring and autumn, immense volumes come thundering down the amazing height with such velocity, that their monotonous booming can be heard distinctly at Piseco, fully sight with a new re-

cight miles away.

In winter the Falls are covered from top to bottom with a

eight miles away.

In winter the Falls are covered from top to bottom with a glare of ice, which glitters under the western sun as one vast mass of burnished silver; whilst from below are built up mimic cathedral spires of purest crystal, that lift themselves to greater and greater heights, till the vernal sun breaks the bands of the forces that are held captive above, and the quiet vale is turned into deafening, seething pandemonium.

In reference to the height of the Falls there are afloat many extravagant statements. The matter has been partially settled by Col. J. T. Watson, of Clinton, N. Y., who made measurements in 1876. The swift rapids at the top of the Falls are one hundred feet in length; the sharp pitch, three hundred and ninety feet; and the almost perpendicular fall below, two hundred feet, yielding a total of six hundred and ninety feet. Until Mr. Colvin's interesting and valuable labors shall have been extended into this section, we must remain content with these figures. In width the Falls vary from thirty feet above, to three hundred feet below.

The place is undoubtedly more easily accessible from Morehouseville than from Piseco. Theodore C. Remonda, a trustworthy guide from the former place, has brought in many parties that included ladies in their number. The distance from that place is nine milles, three of which can be made by boat. Along this route, also, lies Bluff Mountain, on whose hase ice was tut out on the 22d day of August last.

Not more than three rods from Snowstorm's Delight stands an onen bark shauty a god-scand to the wearied tourist.

whose base ice was cut out on the 22d day of August last.

Not more than three rods from Snowstorm's Delight stands an open bark shanty, a god-send to the wearied tourist. Doubly weather-feaded is he, by bark and by foliage. How toothsome the salt pork, how sweet the odor of the bushy bits of balsam, that make a bed as soft as down. The camp-fire burns brightly, revealing endless beauties in beechen canopy and on many-hued boles. The waters croon a drowsing lullaby; the stars o'erhead keep watch and ward. Deep and restful is the repose from eight of the evening to eight of the morning. Healing and strength come with every inbreathing of this pine-blest air. This is re-creation,

A TRIP TO TEXAS.

A TRIP TO TEXAS.

Lyce since the admission of Texas into the Union of States, I have had a strong desire to visit that imperial domain and see what was to be seen. Of course, I had no expectation of being able to traverse every square mile of its territory, or even every county—but I had an ambition to look at some of it, and enjoy whatever of comfort or pleasure might be afforded. Its vast prairies of fertile soil, swarming with grouse and deer, had a charm for me; and I thought if I could spend a few weeks in such a lovely land, I could realize all the fond anticipations which I had indulged, and get such a surfeit of hunting, that the old State in which I was born would thereafter ofter little inducement for trial upon its game.

upon its game.

It so happened that I made my arrangements to gratify my
wishes in regard to the visit, and on the 2d of October last,
I bade aclieu to my household and left for the land of promise.

I had several hundred—leaded shells and my 12-bore Westley.

I had several hundred losaled shells and my 12-bore WestleyRichards, and expected, before many days, I should be writing to the sporting friends when I left behind, glowing accounts of successful adventures in what I was led to believe
was a very Paradise for Ninrods. After a few hours' ride, it
reached Charlott, stopped at the Central Hotel, over which
the smiling and genial Excles presides, and at midnight took
celebrated Cotton Exposition was to be opened with imposing
ceremonies. I was too cager for Texas, to allow such a
paltry affair to detain me, and so on I sped for Chatlanooga
and Slemphis, at which latter place I was kept for a half-day
waiting for the departure of the Little Rock train. But it
started after a while, and then the Alississippi, the St. Prancis,
I'Anguille, the White and the Arkansas rivers were successively crossed, and I got out of the train, to wait one day in
the started after a while, and then the Alississippi, the St. Prancis,
I'Anguille, the White and the Arkansas rivers were successively crossed, and I got out of the train, to wait one day in
the train of the same training the started after a while, and
dogs. He had determined to go on with me without stopping
me, and was, unfortunately, detained at the hotel so long,
that when he reached the depot, he found I had gone down
into the city. He returned, and before I had gotten to sleep,
was loudly knocking at the door of my room. The next
night we were off, and breadfasted at that well-known town
whose dimensions are so great, that it requires two States to
hold it, and whose accommodations for hungry travelers are
saw, and supper those of Texas, until we wait to fort Worth, arriving about half-past two P. J. Here we found a somewhat
pretentious hole!, but infested with mosquitoes.

Next morning 1 so tup early and when this to lee northern
and highest part of the eliy to take my first view of a rolling
prince of the proper service o

The last day of my stay I succeeded in killing four prairie chickens, five upland plovers, and two mule-eared rabbits. I used No. 6 shot and three drachms of gunpowder, and several of my shots were at long range. The best chance I had I failed to do anything, for the reason that my gun had no shells in it, and the prospect for game had so excited me that I forgot the fact until it was entirely too late.

of my shots were at long range. The best chance I had I failed to do anything, for the reason that my gun had no shells in it, and the prospect for game had so excited me that I forgot the fact until it was entirely too late.

I confess I was somewhat disappointed in the flavor of the prairie chicken, but, perhaps, it was owing to the fact that at the breakfast when I tried them we had some plover, which made a marked contrast. The plover is one of the very best birds I have ever tasted, and comes as near equaling the darkey's idea of "possum sop and tater"—"too good to talk about"—as any food I have ever tried. It may not be a plover, but that is what it was called. Certainly they were fat and delicious.

It is very probable that there are many places in Texas, which would satisfy the most exacting sportsman's demands, but, so far as I am concerned, that depends entirely upon the testimony of others. In the more unsettled portions of that great commonwealth no doubt game of various kinds abounds in sufficient quantities to satisfy all proper aspirations. During the spring I hear that there are thousands of plover in the prairies. Usually Bob White's soft voice is heard in the woods and fields, the timber is supplied with squirrels, turkeys and deer, and during the winter months the ponds and lakes are said to be full of ducks. All this I state upon the authority of others. But I didn't find the abundance I sought, and my trip, as a sporting tour, was a failure. My advice is that all sportsmen who visit that country should get transportation for their dogs, for the baggage-masters are merciles in their extortions, and sometimes not far from insolent in their demeanor.

On my return home I concluded to stop for a week or more in Arkansas and see if the bottoms in that State would not afford more sport than I had had in Texas. Therefore, when I reached Little Rock I went, without much delay, to a plantation about two miles below, where I knew in former days ducks could be had in abundance. Unfortunately for me, c

PINE WOODS, North Carolina.

FLORIDA RESORTS.

THIS letter is written in camp at Rockledge, Indian River, Florida. For the past three weeks we have been enjoying the most delightful Florida winter weather. The thermometer has ranged from 70 to 80 degrees in the shade at midday. No rain has fallen, and there has been a nice cool breeze nearly every day.

Rockledge hammock, with its numerous orange groves, has been the delight of every visitor. The steamer Marion con-

Rockledge hammock, with its numerous orange groves, has been the delight of every visitor. The steamer Marion connects with the De Barry Line at Sanford on Monday and Thursday, leaving a 9 A. M. for Rockledge, and is recommended by those who come on here as much superior to any boat that has run to the upper St. John.

The last boat brought quite a party of well-known residents of Atlanta, Ga., and Dr. Henshall and wife, of Cynthiana, Ky.; C. L. Jordan, of Willis, Texas, and N. H. Bishop and wife, of "The Paper Canoe." They have all spent a few days with us to complete their arrangements for going down the river.

wite, of the rape.

Adays with us to complete their arrangements for going down the river.

The Doctor and party propose to devote the entire winter to the explorations of the various inlets, keys and islands as

to the explorations of the various inlets, keys and islands as far as Ceder Keys on the west coast. Since our arrival we have visited Dr. Whitfield's Banana River, Canareral Light, Dummit's Grove and the groves of Capt. Buruham, Wilson, Mrs. Hall and many others. The Doctor's place is on Merrit's Island, five miles south of Rockledge. The site is one of the most romantic on Indian River, occupying a high shell ridge some fifty feet above the water and commanding a beautiful view of a little lakelet at its foot, Indian River further west, Banana River on the east, and far away the Ocean ridge, and Canareral Light far to the northward.

In the Doctor's garden were grove pears confidence.

northward.

In the Doctor's garden were green pears, cauliflower, onions, tomatoes, cabbages, lettuce, mustard, sugar cane, bananas, radishes, beets, cucumbers, dill, sweet and Irish potatoes, fig trees, paw-paw, gum-a-lim-bo, rubber tree, prickly pears at

potatoes, figtrees, paw-paw, gum-a-lim-bo, rubber tree, prickly pear, etc.

On Banana River on the ocean side are the groves of Mrs. Hall, Capt. Wesson and Capt. Burnham, the Old De Soto and many others. We have also visited the noted Dummit grove belonging to the Duke of Castellucia.

The orange crop on Indian River this winter is abundant and of fine quality. The Duke is sending about 200 boxes by each boat.

In our camp we have the luxuries of venison, fish, oysters, ducks, bananas, oranges, limes, lemons, sweet potatoes, egg plants, etc. The new crop of tomatoes is beginning to arrive from Lake Worth, from which the farmers expect to realize three or four thousand crates.

the three or four thousand crates.

The boatmen have been overhauling their boats, for excursion parties and visitors are coming with every boat to go down the river on hunting, fishing and exploring parties.

The stores here are well stocked with the provisions and tackle necessary for a trip, but extra ammunition, tenfs, etc., must be brought by the parties themselves.

RICE BIRD.

Matural History.

THE HIBERNATION OF ANIMALS.

6 DON'T black bears sleep through the winter?" quastioned the writer of an attendant who was dealig out mid-day rations of bread and milk at the park.

"That's the general impression," was the rejoinder, "ht we have never noticed any attempts at hibernation her. Bears are unusually lively during the cold months, and lemand their food as regularly as do the lions and other fene aminals. I don't know that any observations of value on his question have ever been made on animals in confinement." I have had some experience with outside animals, and sgreat many go through what is called a winter sleep; and twarm countries there is what might be called a summer sleer. Bears begin in the fall to look out for a soft nest; and ift's possible for them to cat more at one time than anotherthey do it then, and when the cold weather sets in they arefat and in prime condition. According to some authorities, he fat produces the carbon that in some way tends to inace somnosiblency. The stomach of a bear at this time becores empty, and naturally shrivels or draws into a very small pace, and is rendered totally useless by a substance called 'tappu' that clogs it and the intestines; this is formed of pine leves and other material that the animal takes from ants' nes and the trunks of trees in its search after honey. They liesleep in this condition for about six months, generally snowe in; but you can tell the place, as the heat of the bear, who there is left, keeps an air hole up through the snow. The bar seems to live on its fat, the tappen preventing its too rapid onsumption; and if you run across them during this time—even along in March just before they wake up—they are bout as fat as when they went in. I have taken a slice of fs from a black bear six inches thick—regular blubber. I reaember,' continued the man, "one winter I was 'log haulin,' in the western part of this State. We had our eyes on sbig tree, and one morning when it was about ten degrees below zero I tackled it to warm up. I hammered away fortbought. The snow was

they consume when respiring more than four cubic menes of oxygen an hour.

The common marmot is a great underground sleeper. They build large storehouses, sometimes eight feet in diam-eter, and from the latter part of September to April, they lie in them, and, like the bears, give birth to their young during this period.

The dormouse is a remarkable sleeper. Even in their ordi-The dormouse is a remarkable sleeper. Even in their ordinary sleep they can be taken from the nest and handled without waking them. Toward winter they acquire a great deal of fat, and stow away a vast amount of provision around about their nest, and then go to sleep within; but they rarely awake to use this food unless a very warm period comes around before the regular breaking up of cold weather.

The hedgehog is a sound winter sleeper, and has been the subject of an infinite number of experiments while in this condition. One experimentalist, believing that cold was the cause of their curious condition, surrounded one with a freezing mixture, and froze it to death. By increasing the cold about another that was already hibernating, it was made to wake up; and walked off.

about another that was already internating, it was made to wake up; and walked off.

If an animal is suddenly decapitated while in this hibernating condition, the action of the heart is not affected for some time, a second life seeming to outlive the one taken. An experiment has been made in which the brain of the sleeper was removed, then the entire spinal-cord, but for two hours hardly any change was noticeable upon the action of

the heart; and a day after that organ contracted when touched by the operator.

The writer has the winter nest of a family of ants. A piece of fence rail was found beneath an old pile of boards and brought into a warm room for the sake of a rich fungus growing upon it, and several hours after the table and chairs were found to be covered with ants. Where they came from was a mystery, until the old rail was accidently jarred and a number fell from it. A section was cut down through it, and the winter home of the tribe destroyed. Probably the work of weeks, perhaps months. The interior of the wood was completely riddled by tunnels and passages, some being large and holding several hundred ants, while others contained only a few. In some of the interior passages the ants had not been affected by the heat and were packed in great masses and evidently fast asleep; they soon recovered, however, and walked off slowly in different directions, as if wondering if an earthquake or spring had come.

A great number of insects go through a period of hibernation, especially spiders. The young of the latter are often covered by the parent; first by coarse strings of silk, as if to hold them in place, and then by a white, silvery web worked over them, which forms probably a sure protection from wind and weather.

The writer has a cherry-stone in which is colled up an insect, best known as the sowbug. A squirrel had probably caten out the next and opened the way, and in this snug retreat we found the little hibernater snugly rolled up, as is also its habit when alarmed. The mouth of the hole was stopped by black soil, but whether from accident or by the mindle sife we could not tell.

Some fishes and reptiles are hibernaters. Frogs and toads sleep out the winter at the bottom of ponds or in holes in the ground. Tree toads, if kept in a cage in the winter and provided with soil, will endeavor to cover themselves with it, showing how strong the instinct or habit is. Some fishes are so insensible to heat or cold that when in this c

As it is not the direct result of extremes of heat or cold that produces sleep, neither is the awakening from hibernation directly caused by a rise of temperature. In experiments made upon weasels, which are sometimes caught asleep, one came to life in about three hours, during which the temperature of the room remained the same as it had been during the entire hibernation, viz., 10° Cent. In another weasel, during the awakening, the body temperature rose very rapidly—and more so in the second part of the period than in the first. In the first hour and 55 minutes of the above awakening the body temperature rose 6.6°, Cent., and in the following 50 minutes it rose 17° Cent. This remarkable increase took place without any vigorous movements on the part of the weasel. Even its breathing showed no increase in proportion to the rise. These cases show that though, at certain seasons, animals relax as it were and lie dormant, and recover, seemingly at the will of the weather, yet, in point of fact, the rise and fall of temperature has no direct effect upon them. The cause is an internal one, awaiting discovery. C. F. Holder. As it is not the direct result of extremes of heat or cold

Long Island Notes.—A tame crow at the ship-yard of Thomas Clapham, the yacht builder at Roslyn, talks. It saintes a stranger with "hello" and says "old crow," and other words. Bluebirds have been seen at Roslyn all through this month; and a kingfisher has wintered near Mr. Clapham's ponds. A robin was observed last week. Sparrows are plenty about the villages, and even in the country the farmers are complaining of their depredations on their grain in summer. Bushels of soft clams six inches in length and weighing nearly a pound apiece were dug in Roslyn harbor during the recent low tides.

CHICAGO, ILL., Feb. 11.—Telegrams from the Kankakee, Illinois and Calumet rivers say: "Ducks coming in by thous-ands;" all the boys are off for the marshes.—Ten-Bone.

Game Bag and Gun.

THE PURPOSE OF FIELD SPORTS.

[From Dougall's "Shooting: Its Appliances, Practice, and Purp (Continued from Page 12.)

WE may therefore lay it down as absolute, that true field sports may be invariably distinguished from the falsely so called by the latter being carried out vicariously. In these the "sportsmen," Heaven save the mark! are mere spectators, generally gratifying, more or less, brutal propensities, and in all probability staking sums of money on certain contingencies. The active agents are the men or dogs, that within a commed space are lighting fiercely with early other, as in confined space are lighting fiercely with early other, as in confined space are lighting fiercely with early other, as in the state of the confined space, for a cat does not run any distunce before a dog, but either stands at bay or takes refuge in the nearest coign of vantage, while a fox, to which the cat is likeued, puts his trust in cunning and speed of foot, in the greater number of instances balling is fox, to which the cat is likeued, puts his trust in cunning and speed of foot, in the greater number of instances balling his pursues. It is astonishing to me, who have long studied this question carefully, conscientiously and impartially, and who will yield to none in detestation of all forms of cruelty, to find how systematically the above distinction have been into the pursuit of each of any of the lower animals, to see this distinction staring them in the face. Whether in the roperly so-called field sports, or in the quast, as foot-ball, cricket, the Scottish game of "shinty," rowing, skatting, and son, Action, Action, Action, as Demoshenes said of oratory, is the life and essence. Are we to believe that this systematic ignoring of distinctive principles is purely unintentional, and that there is no desire to take every advantage, probably enough from the warmth of supposed humanity, by classing the false and the true under one head of "Popular amusements" We may honor the function, but not there may be some good and genuine reasons why foxity and the supposed and the sown how and why, but do not condemn them on false grounds. Do not

the descriptions of such scenes are painfully affecting to "In the whole range of observations on natural history there is nothing more remarkable than that made by a recent traveler of undoubted truthfulness. The author has mistaid the verbatim extract made for life present purpose, so that he cannot do the traveler the justice of naming him and the title of his book, but the facts are here stocks, after the breeding season, prepare to migrate southwards as winter approaches, they make flights to test the capabilities of the young birds to accomplish the coming journey. When any one is found not to possess the raquisite strength, it is deliberately put to death by the ofacers! As storks principally feed on frogs, which are not to be found in winter through retreating to inaccessible places, what an admirable instinct is this which commands the older birds to save the weakings from future sufferings by an instantaneous death. The proof of Divine arrangement is clearly made manifest; indeed no reflective mind can consider the above fact without admiration of that All-governing Power which thus endows even storks with prescience, and makes them "cruel only to be kind."

readers of even average sensibility. The fact seems to be, that as the Scriptures put it, man has "domain over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth." The wondrous wisdom of this arrangement is at once apparent when we consider that, without it, it would be impossible to define the limits of man's absolute right to utilize in any form the brute creation. If endless discussion arise even now, what would be the state of matters had this arrangement not been made? As it is, cruelty can only be charged when there is wanton torture, and this cannot be fairly charged against the practice of any legitimate field sport. Besides it would, as I say, be so impossible to define man's prerogative, that the use of domestic animals for any recreation whatever would be an endless question of morality. In such a position the researches of naturalists, the recreation of the multitude, the innocent amusement of countless invalids, must be foregone. Is the pain inflicted by the rapid pursuit of a bare or a fox, terminating in escape or instantaneous death, for one moment to be compared to the prolonged feverish torture of the restees carnivora confined in zoological collections and menageries? Is the horse always willing to be saddled? Is there any mode of learning the present state of his internal economy when he is being harmossed, or of his fitness for exertion there and then? Must I send my parrot back to Africa, and return my bullfinch to his native groves? Until these questions are satisfactorily answered we are entitled to assume that, while abstract benevolence must necessarily condemn all use of the lower animals to which, had they the power, they would refuse consent, the present condition of things and the arrangements of Providence entitle us to treat the whole question as one to be governed by reason and utility rather than by a useless and sentimental humanitarianism. It was diseased activity of conscientiousness—moribully weighing things, not as the

in things and the arrangements of Providence entitle us to treat the whole question as one to be governed by reason and tillity rather than by a useless and sentimental humanitarianism. It was diseased activity of conscientiousness—morbidly weighing things, not as they are, but as they might be, in a state of pure benevolence—that drove Shelly to vegerarianism and atheism. In this question the hard Benthamite doctrine of the greatest amount of good being the rule for guidance may be fairly urged. I dislike the word "expediency," but bearing in mind that 1 am now offering illustrations on the general question of cruelty, not specific arguments in favor of field sports, I think that Paley's doctrine of expediency is also singularly applicable. In the debtor and creditor argument, the question is not to what purpose the latter intends to devote the money recovered. It may be for the expenses of a pleasurable journey; it may be for a questionable gratification. No sentimentalist assails the right of recovery solely under the plea of possible misapplication of the sun recovered. Yet sportsmen are assailed on the score of cruelty if the object of their pursuit do not furnish food or clothing, although that pursuit most undenkibly affords higheric benefits as valuable as either to the physical frame, and still more valuable to the intellectual well-being.

The abuse of terms, the confounding of things lawful and things unlawful, are not merely negatively wrong; they are positively mischievous, and may do more harm to morals in one year than field sports, even when they are carried to a blameworthy excess, can in ten. There is nothing more positively mischievous, and may do more harm to morals in one year than field sports, even when they are carried to a blameworthy excess, can in ten. There is nothing more certain than that everything done or promulgated by the upper or authoritative classes is keenly scrutinized by the inferior either in years or position—keenly for good, still more keenly for evil. The latter is un

grievous wrong, and place themselves in the position of those originators of sin who are more to be reprobated than sinners. Journalists are peculiarly liable to be influenced by this confusion of terms—I mean those journalists, litterateurs, who are called upon by the exigencies of their profession to write upon all manner of subjects, and treat these subjects in accordance with the views of their organ, honestly enough professionally, but without much concern as to the actual merits of a question when viewed dispassionately, and freed from the inovitable bias of the journal written for. There was a class of journals where in juxta-columns were to be read the records of pugitism and idylls upon angling pure as from the pen of Izaak Waiton. There is another class of journals, to whom all field sports are Anathema Maranatha! I have seen, within a recent period, an able and haudable article upon pugilism, published in a first-class American magazine, in which, with the best intentions, the writer states that his purpose is to give the history of "the rise, decline, and fall of this branch of Field Sports in the United States!" Still more recently, I have read a leading article in a London weekly paper of large circulation, denouncing in unmeasured terms the loss of hundreds of thousands of acres of valuable "wheat land" (fact) now devoted to the brutal sport of regrouse shooting!! Does any rational man believe that the writer of that article drew his inspiration from personal belief through trusting to the general denunciation of field sports by certain leaders of public

opinion? These latter may know when to stop, but their followers and imitators "better their instructions," and spice their articles to suit the palate of their renders, regardlessly of the evil effects necessarily arising from the propagation of unfruth. They are indeed the less to blame, in that they take for granted what has not been proved, and, on the principle given above, that safety in morals lies in abnegation, so satisfy their conscience. The primary misleading lies in the general high reputation of those writers whom journalists blindly follow. But what mischief is not created by setting class against class, not to speak of that injury or hindrance done to the redressing of real by the creation of false grievances. In many instances the ignorance of journalists takes a Indicrous turn. Some years ago there appeared in the Twelfth of August impression of a daily paper of eminence a paragraph to this effect (I quote from memory, but the words, if not their arrangement, are correct)—"By the time this morning's paper is in the hands of our readers, the horus of the hunters will have been heard on a thousand hills, and many a gallant heath-cock, after an animated chase, will of the hunters will have been heard on a thousand hills, and many a gallant health-cock, after an animated chase, will have stained the heather with his crimson blood," and so on. The thing was so exquisitely tickling to my fancy, that I followed it up by sending to the paper a still more spicy paragraph, describing the horses, the red-coats of the hunters, down to their spurs, with the hounds in full cry. The editor, however, could not swallow that; he drew the line at the horns of chase, and had the acumen not to insert the paragraph.

paragraph.

As leading up to the few remarks I shall make on the positive side of the question, I quote the following from the autobiography of Benvenuto Cellini:—

positive side of the question, I quote the following from the autobiography of Benvenuto Cellini:—

"About this time, whilst I was still a young man of three-and-twenty, so dreadful and epidemic disease prevailed in Rome that there died every day several thousands. Though I was somewhat terrified at this calamity, I began to indulge myself in certain pleasures of fancy arising from different causes, which I shall hereafter specify; for on holidays I amused myself with visiting the antiquities of that city, and sometimes took their figures in wax, at other times I unde drawings of them. As these antiquities are all ruinous edifices, where a number of pigcons built their nests, I had a mind to divert myself among them with my fowling-piece; but being greatly alraid of the plazue, I avoided all commerce with the inhabitants, and made Paulino carry my gun; thus we repaired together to the ruins, from whence I often returned home loaded with pigeons of the largest size. But I never chose to put more than a single ball into my piece, and in this manner, by being a good marksman, I procured a considerable quantity of game. The fowling-piece which I held in my hand was, both on the inside and outside, as bright as a looking-glass. I likewise made the powder as fine as the minutest dust; and in the use of it I discovered some of the most admirable secrets that ever were known till this time. Of this I will, to avoid prolixity, give only one proof, which will surprise even those who are adapts in this matter. When I had charged my piece with a quantity of powder, equal in weight to the lift hart of a ball, it carried 200 paces point-biank. In a word, so great was the delight I took in shooting, that it often diverted me from the business of my shops. Though it had this ill-consequence, it in other respects procured me considerable advantages: for, by this exercise of shooting, I greatly improved my constitution; the air was of rost service to me, and braced my nerves, which were naturally relaxed. Whilst I was enjoying t

In the above remarkable passage lies the marrow of the whole matter, and the curious reader will also observe with interest that Cellini, with all that force of character which marked the man, went deeply into the "most admirable secrets" in the use of gunpowder, and practically anticipated the point-blank range of modern rifles by over three centuries. Now, if any one lived who might be supposed, through love of his art, vanity, and other incentives to exertion, to be above or beyond the requiring of field-sports to brace his nerves and restore his jaded spirits, it is the immortal sculptor of the Perseus. The world may never know how much it is indebted for those gems of art which make Cellini's name tower above that of any other competitor—rival he has none—to the "exercise of shooting" described above. Had he plodded on, minded solely the business of his employers—of his "shops," as he nodestly terms them—he might have produced a great number of mediocrities, and there an end

employers—of his "shops," as he modestly terms them—he might have produced a great number of mediocrities, and there an end

What then do we shoot for, what is the purpose? The answer is, that the very foundation of all intellectual advancement—maintained exertion of thinking faculties—as well as the concomitants of high civilization, such as more luxuriant living, the congregating for much of our time in confined spaces, as must be in all city life, commercial, legal, or legislative, and the non-necessity of actual daily labor by the possessors of acquired or hereditary capital (for all wealth is originally founded on labor of some kind or other) demand some counterpoise to balance our constitutional equilibrium. It may be asked why not take exercise without following a field sport? The reply is clear—the more we exercise our intellect the less we are inclined or able to exercise our body in equal degree without a stimulus to exertion, and that stimulus the chase supplies. Cellini could have taken a walk, but "this exercise of shooting" would have been wanting, and so it is now. Put a gun into the hands of a man who may not walk five miles along a highway with case, and the difficulty will be, not to get him to walk five, but to restrain him from walking twenty. Just then as there has been a severe strain on the mental, and a neglect of the physical, powers, so there is now brought into action a reversed process. The mind goes into abeyance; the body comes into play; the deep reasoner, the fagged merchant, the speculative philosopher, disappears; the latent hunter asserts his prerogative. Men therefore are enabled to rapidly compensate for their previous enforced physical inaction, go back to a state of nature and the toils of the primitive hunter for a time, and yet not break in unduly or for too long a period upon the exercise of their highest intellectual faculties. I think I am safe in asserting that the highest order of thought is incompatible with sufficient daily bodily exercise. To attain high developm

purpose in order to obey them. The law is there, and abides; the Creator has arranged the final results. The Duke of Argyll, in an admirable article "On Animal Instinct" (2 he Contemporary Review, July, 1875), has put this very clearly. "All our trust and confidence in the results of reasoning must depend on our trust and confidence in the adjusted harmony which has been established between instinct and the truths of Nature. "All our trust and confidence in the results of reasoning must depend on our trust and confidence in the adjusted harmony which has been established between instinct and the truths of Nature. . . . We see it to be a great law prevailing in the instincts of the lower animals, and in our own, that they are true not only as guiding the animal rightly to the satisfaction of whatever appetite is immediately concerned, but true also as ministering to ends of which the animal knows nothing, although they are ends of the highest importance, both in its own economy and in the far-off economics of creation. In direct proportion as our own minds and intellects partake of the same nature, and are founded on the same principle of adjustment, we may feel assured that the same law prevails over their nobler work and functions. And the glorious law is no less than this—that the work of instinct is true not only for the short way it goes, but for that infinite distance into which it leads in a true direction." In connection with this branch of the subject it may be fairly asserted that, the peculiar scent given out by game, the manner in which game animals (birds in particular) erouch and then suddenly start into motion within range of the gam, and then suddenly start into motion within range of the gam, and then suddenly start into motion within range of the gam, and the whole nature, powers of smell, and general economy of hunting dogs, argue an arrangement far beyond the powers of Man. The whole scenes a wise adaptation to some specific purpose. Men may have trained dogs to the chase, but could never give to the objects of the chase the peculiarities which distinguish them from other animals, and cause them to be hunted as game, with all the advantages I contend for.

That many men hunt or shoot who do not overstrain their intellect is a mere matter of course, because the instinct of the chase is universal, and is confined to no one class, or intended as a counterpoise to any one tension only in another direction. No "glorio

l know not if it come exactly within the scope of this ar-

in the restorate, which is confinded him. Long may he enjoy them!

I know not if it come exactly within the scope of this argument, but it may be incidentally remarked that where there is undue prominence given to the intellectual faculties, or where these faculties have risen to an undue prominence, the family most commonly becomes extinct, or else the intellectual power disappears and is followed by its opposite. The family of the Bernouillis, the famed mathematicians, is nearly the only exception. The existence of their great and hereditary abilities, in which quite a number of them shared, extended over several generations, and beyond 150 years in period of time. But every one knows that an exception only proves a rule. It is a fair assumption, that the mingting of the labors of field sports with maintained exertion of the mental faculties would tend to transmission of genius.

In judging of the correctness of the foregoing reasoning, and of the morality of field sports, it would be well to consider how these have been followed by the wisest, the best, the purest of mankind. Witness George Washington, who kept a private pack of hounds, and hunted the fox regularly two or three days a week. The Duke of Wellington maintained the spirits, vigor, and courage of his officers, on his constrained military inaction during several winters in the Peninsula, by the same means. Buxton, the philanthropist, was not only a sportsman, but attributed any success in life and proper direction of his aims and faculties to the early moral training he had under a perfectly illiterate but high-souled gamekceper, whose memory he held in deepest reverence till his dying day. The nearest practical approach I have ever known to the scene in Burns' magnificent "Cotter's Saturday Night" was in the evening family worship of a gamekeeper, under whose roof I found hospitable shelter while on a shooting excursion in Dumbartonshire. It is with all respect and reverence that I may also allude to the case of his late Royal Highness Prince Alb interested in all the Prince's adventures, successes and disappointments by flood and field. Witness the vigor with which "a magnificent stag" which Prince Albert had just killed was sketched by her loving hand. We saw also all this healthiness of tone and love of genuine field sports perpetuated in her royal sons. We need not doubt the destinies of a people with such examples set before them, nor fear the degeneracy of the Lower Empire.

In regard to the effect of the pursuit of field sports on the commercial classes, I shall not readily forget a recent conversation with a gentleman from one of the Western United States of America. I have particular satisfaction in any investigations into the moral and other good effects of shooting, but I have never heard the matter put so plainly. "My father, sir," said my friend, "was the first man that ever took a double-barrel shot-gun west of the Alleghenies, and when I was a boy I always shot squirrels with a rifle. My father was also the first man known to kill birds flying—out there West. He was a great sportsman, and made us, his sons, go out to shoot regularly to make us strong and hardy. Our neighbors said, 'This Mr. McO— is bringing up his boys to ruin, certain and sure; he sends them to shoot squirrels when they should be at the counter and desk,' Well, sir, time went on, and my brother and I went on, not to ruin, but to success in life as well as in shooting, and I used to kill my sixteen squirrels in seventeen shots of a morning. I have a large business, and my brother, who is younger than I, has already retired on a fortune. Of the young men who were pointed out as patterns to us, not one is now living. One died of this, another of that, but mostly all through illness brought on by making money their only object; and I tell you, sir, that on their death bed more than one of them said, 'These McO——s were right, and we were wrong, after all.'"

This simple narrative probably contains the germ of a al)

all."

This simple narrative probably contains the germ of a great philosophical truth. It seems an established fact that, besides the general struggle for existence in all animated nature, there is a special one for existence in individuals imported into a new climate. Let us suppose two families engaged in commerce migrating "out West." The children of one of these are encouraged to familiarize themselves with the surrounding climate influences; to face and overcome these influences under invigorating action: the children of the other are not, but are brought up, let us say, accordingly with their New York or European antecedents. These sit at a desk, those shoot squirrels in the forest. I think it may be a desk, those shoot squirrels in the forest. I think it may be safely predicted which will be the survivors.

This American is a type of the sound sense of his countrymen. There is not a programment of the survivors.

a desk, those shoot squirrels in the forest. I think it may be safely predicted which will be the survivors.

This American is a type of the sound sense of his countrymen. There is not a more common fallacy than that game laws, denounced as the remains of a barbarous feudalism, are not to be tolerated in new countries or under Republican Governments. To many of my readers it may be something new to learn that, in the United States of America, the game chown are much more stringent than in this country, and embrace a larger number of animals. The penalties are much higher, and every encouragement is given to proscention by any person by such complainant sharing in the pecuniary fines. Were this a treatise on game law I should startle my readers by going more fully into those existing in the United States. Besides the usual punishment to offenders directly infringing the law, all railway officials, carriers, and such like are heavily fined for illegally transporting game or fish, and where either of these is reasonably supposed to be concealed, the warrant of a justice of the peare authorizes "search to be made at any hour, in any house, market, store, shop, boat, car, or other place of concealment to be broken open and the contents examined." It is also provided that "the formalities required in penal actions" need not be compiled with. I quote from the Laws of New Jersey, merely because they are the first I chance to light on, but they are very similar throughout the States. If any particular variety of game becomes scarce a State will pass a law to protect it absolutely for several years. What is this to do but what is commonly called here, "getting up a head of game?" Several such enactments are running now. We hear of individual game preservers here being bitterly assaled, yet in the United States there are over one hundred powerful associations for the due prosceution of game law delinquents, and the associations are rapidly increasing and appear to be highly popular. Here we have one struggling Anti-Game L our fish for our genuine field sports. There is no opposition party in the field. The Associations are banded together, not to oppose any other party, but to stimulate legislative vigilance. This is a curious antithesis. It may be likened to the different training of youth in Sparta and Athens. The latter encouraged the chase, the former denounced everything not directly or palpably useful, even to any superfluity of words. We all know which Republic lasted longest, or rose to the highest point in civilization. We need not fear the final result in our own country, but the Americans are also wise in their generation, and seem resolved to maintain the vigor of their race by the means which Nature has appointed.

If we turn for a moment to a very different country, old in its institutions and the most densely populated in Europe—Belgium, we shall find equal stringeucy. In a communication which the Belgian Minister of the Interior did me the honor of sending me for the purpose of this inquiry, I learn that in

which the Belgian Minister of the Interior did me the honor of sending me for the purpose of this inquiry, I learn that in addition to the punishment as a matter of course of a convicted delinquent, the farmer, or farm foreman, is held responsible for acts of poaching committed by minors and some others; a system that would not be tolerated in Britain. This is stringency indeed, and yet, while high cultivation is alleged to be incompatible with the existence of game laws, no country in Europe, or probably elsewhere, is more highly cultivated than Belgium.

Since I have made this digression I may state that, while undue preservation of game is open to severe censure—the

than Belgium.

Since I have made this digression I may state that, while undue preservation of game is open to severe censure—the effects are too frequently greatly overrated. I have had much experience, and have been surprised to find how bitter complaints by farmers have ended in the finding of no appreciable injury to the crops. But I would desire to write much more freely on the absurd outery made against "deer forests." Wherever deer do injury let the blame rightly fall and a remedy be found, as by sufficiently fencing the nearest arable lands; but what I especially refer to is the misleading of the public opinion on what a "deer forest" consists of, until the masses believe that it is a tract of valuable wooded land, able to support a large number of sheep or oxen, being wickedly devoted to the feeding of a few red deer kept for sport. Deer foreats (in this country they are only, so far as I know, to be found in Scotland) are tracks of the roughest, wildest, most inaccessible, and most valueless land in the Highlands. As for being "forests," there may not be a tree upon them. True, they might support a few cattle, but would it pay to do so? Are sheep to be kept there at a loss for the sentiment of the thing? I write advisedly. Some three years ago an unusual clannor arose because a certain sheep-farm in the northwest of Scotland was bought by a gentleman and turned into a forest. I cannot recollect anything more virulent than the

obloquy thrown upon him. Knowing the purchaser, and belleving that from his whole tenor of life, general character, and political bias he would be a very unlikely person to either do a wrong thing or run counter to the liberal tendencies of the age, I asked him to tell me the real facts, and learned that the farm in question had ruined tenant after tenant; that it was quite unsuited for profitable pasture; and that, at the time of the purchase, several of the neighboring farmers, who, of all men, considering the competition in Seotland for farms, had a right to complain, had thanked my friend for "afforesting" the estate and so removing temptation to inevitable ruin from before their eyes!

The direct purpose, then, of shooting is to stimulate what may be called concentrated labor. This is, labor in proportion to previous enforced physical inaction; that physical inaction having been a necessify under prolonged intellectual exertion, or otherwise under the conditions of high and advancing civilization. To write on the immediate effect on the human system is uncalled for. No one denies the bene-

advancing civilization. To write on the immediate effect on the human system is uncalled for. No one denies the benefits; they are plain and self-evident as affecting the body. The appetite and digestion gradually improve; and although I have avoided any of those references to the proper cooking of game usually made in books on shooting, yet through all time a hunter's or sportsman's appetite has been taken as a matter of course, and as his due reward. Twenty-three hundred years ago Euripides wrote—

'Tis pleasant when the chase is o'er At tables full to feast galore

At tables full to feast galore.

The effect upon the mind from my stand-point, as bearing upon man in a highly-civilized state, is of prime importance. Harking back to Benvenuto Cellini, we find these words—"My spirits suddlenly revived. I had no longer my usual gloom." Why, he probably could not himself explain; but he recorded what modern science can better account for, and what I have myself experienced, as probably have many of my readers. I remember that my late beloved friend and pastor, the Rev. Dr. Norman Macleod (who used to tell me that he endorsed every one of my published opinions on the morality of field sports), took much interest in the fact that, under the stimulus of shooting, a melaucholic cloud will pass away from the mind so instantaneously as only to be likened to rapidly drawing up a curtain and letting bright light into a dark room. This probably arises from the balancing at that precise moment of the excretory action of the liver and lungs, and so a most mysterious phenomenon may be a dark room. This probably arises from the balancing at that precise moment of the exerctory action of the liver and lungs, and so a most mysterious phenomenon may be accounted for. I only refer to this phenomenon may be accounted for. I only refer to this phenomenon may be accounted for. I only refer to this phenomenon as a proof of what great general beneficial action must be going on in all cases, and by no means require to narrow up my argument into any speciality. I choose one remarkable illustration without disparagement to other results probably as remarkable although less striking. It may not be out of place to mention, however, merely as a fact on which I would desire my readers to reflect, that in all probability almost the whole Protean forms of what are termed "nervous diseases" arise from the inability of the lungs to consume, literally burn up, the fuel provided by the liver. Hence bile accumulates and invades the brain itself. This produces "melancholy," literally "black bile," and it is remarkable that the ancients should thus so tratifully realize the disease in its verbal designation is physical. Until recently the liver was supposed to throw off only a small quantity of bild daily, to be utilized in the alimentary canal. But modern research proves that the daily secretion of bile amounts to no less than three-and-a-half pounds! The liver exercises this bile and also fat and hydrated starch, all which finally become the fuel which provides us with heat. I do not pretend to define this exactly or scientifically, but take my facts from the most distinguished authorities. If the furnace, the lungs, will not, through want of exercise or other causes, consume this fuel, the effects are disastrous. So little was the function of the liver understood, or this quantity of bile duly estimated, that it was thought on any occasion of causes, consume this fuel, the effects are disastrous. So little was the function of the liver understood, or this quantity of bile duly estimated, that it was thought on any occasion of disorder quite enough to carry off a little extra quantity of it by the use of mercury or other drugs. How trifling the benefit to be finally derived thereby may be judged by the fact that of the fifty-six ounces of bile daily secreted, only about two are used in the alimentary canal! In the accumulation of bile having in many cases its sole and genuine remedy in prolonged severe labor, under a stimulus demanded by the very nature of the case, lassitude being its invariable concomitant, we have the complete proof of the correctness of the Duke of Argyll's reasoning—that instinct guides to results far beyond its immediate promptings. A healthy boy ardently desires to fire a gun at a rabbit. This is the same instinct which later in life may be the means of reinvigorating his jaded energies. its immediate promptings. A healthy boy ardently desires to fire a gun at a rabbit. This is the same instinct which later in life may be the means of reinvigorating his jaded energies. I have specially referred to "nervous diseases," because these may most assuredly be termed the great general malady of the age. Every physician knows this; and the art of healing is daily more and more resolving itself into less of drugging and more of directing the patient in his diet and exercise. "Have you a billiard table?" asked a London physician some two years ago, of one consulting him. "No." "Then get one, and play for two hours every night before going to bed. That will bring you sleep, and do you more good than all the drugs in the pharmacopoia." This, with some good advice on diet, was the sole prescription; and never was a guinca more profitably expeaded!

In concluding these remarks I would desire to say that I

more profitably expended!

In concluding these remarks I would desire to say that I have no wish to strain my argument, or to clevate its subject into undue importance. Every good thing is good in its own place. But boasful attempts are being unceasingly made to prove to be wicked what I believe to be a wise arrangement of Providence to preserve the vigor of the human race, and I am quite content to leave my arguments to the judgment, not of sportsmen only, but of all interested in the welfare of mankind

A High Old Elk.—New York marketmen are agitated over a proposed city ordinance, providing that the poultry and game sold in the markets must be drawn. There has been some lively correspondence on the subject in the Sun, in the course of which one writer tells about an ancient clk "At the same place there was half the carcass of an elk, which became as familiar a landmark as the City Hall. Day after day the glassy eye looked out on pedestrians. I used to speculate on the history of that animal, Imagination ran him back to the woods of Maine or Canada, and I exhausted nim back to the woods of Anihe or Canada, and I exhauster Daboll in calculating the days, weeks and nonths that had intervened since he was knocked over, the hands he had passed through, and wondered whether the people were still alive that had eaten the other half of him. But one day I missed him. He was gone. Somebody probably had made an offer. I looked over the deaths for a day or two to see whether there had been even increase. had been any increase.

MIGRATORY QUAIL.

MIGRATORY QUAIL.

In Mr. Tobey's communication, published in Forest and Streem of Feb. 9th, he mentions Orange, N. J., as having received two hundred migratory quail.

It may be interesting to your readers to know that the two hundred quail in question were delivered in Orange in excellent order, and that one hundred of them were forwarded to and liberated at Bridgehampton, Long Island. The other hundred were turned out on the farm of Henry D. Oliphant, Esq., on the western slope of Orange Mountain.

Those turned out on Orange Mountain, so far as I know, have not since been seen, but those which were liberated in various parts of Bridgehampton by my friend Mr. John A. Sandford, were frequently seen during last summer, and in two or three instances young broods were observed.

It will be interesting to know whether the birds return next spring, and I hope that any of your readers who may hereafter observe them, either in the vicinity of West Orange or in the vicinity of Bridgehampton, will communicate the fact to you for publication.

E. E. Q. Orange, N. J., Feb. 9.

The letters in this week's issue of Forest and Stream rom Mr. Tobey and Mr. Smith about migratory quail I have ead with much interest, and am sure that I can in the name I many readers of your paper, thank them for the informa-

on given. The facts given by Mr. Smith in regard to birds planted in Maine are very gratifying. Evidence that they have returned and bred seems conclusive, and should encourage us to keep

and bred scems conclusive, and should encourage us to keep on with the good work.

Our own experiment here in Springfield, Mass., so far as we have been able to learn, has as yet borne no fruit. For myself, I have never lost faith that sometime the birds we had put out, or some of their family, would return; but I must admit that after the first, second and third summers had gone by and no authentic account of their having come, I began to more faint-hearted and wondered why.

admit that after the first, second and third summers had gone by and no authentic account of their having come, I began to grow faint-hearted and wondered why.

In June, 1878, we received 200 birds—all in good condition. Not knowing their habits and the kind of county most suitable, we selected a locality about seven miles from the city, where within a half-mile circle they could find dry pastures, wet suipe ground, thick wheat, wheat and rye stuble, impenetrable swamps, running brooks, mountain side and rich meadow. We gave them a toss in the air and bade them go; go forth from bondage into the bright world, get fat, raise families and come back to us. Not to "go West," as that was where they killed little birds, put them in barrels like herring and sent them across the occan; but to stay with us; we would be good to them, give them fire-crackers on the Fourth of July and fill their stockings with skates at Christmas. Your kennel editor was present, and as active as any one in this work of emancipation, and will verify what I have written, also that they went forth out of the hand like a buller, making a straight flight two or three feet from the ground for a distance of from twenty to tifty yards.

one in this work of chaincipation, and will verily what I have written, also that they went forth out of the hand like a bullet, making a straight flight two or three feet from the ground for a distance of from twenty to fifty yards.

The newspapers here had heralded their coming and noted the arrival, cautioned gunners about killing them and requested them to report any discovery of nests or young broods. No secret was made of the locality; residents in the vicinity took much interest in the matter and frequently reported seeing through the summer single birds and groups; but not a nest was found. An old Frenchman living close by, who had known and eaten the birds in the old country, took the greatest interest in their welfare. The fact that he described the birds so accurately as to size, form and plumage before we had seen them, satisfied us of his honesty; and when he saw them he was most delighted. He looked upon them as friends from home, and at the report of a gun in the neighborhood would lay down his hoe and find the shooter and inform him that city men had put some quail out there and they must not come to harm. Two of us stopped at his house one day when he led up one of his children and told us how he had whipped him the day before for throwing a stick at one of the birds; and getting excited he shook his hand in the little fellow's face and told him he would kill him if he ever hurt one of the little birds. One day in August I stopped to see the old man, and he was radiant with pleasure. He had seen some "leetle quail—three of them;" and he pointed out knoll, not fifty rods from his house. Starting for the place designated, I soon saw my dog at a point in the exact spot he had marked. As I came up to him and stood looking the ground over, up jumped a little fellow from annong the running berry vines, and, in an instant, two more, not larger than sparrows, flew perhaps thirty feet into the weeds; and though, by aid of the dog's nose, I followed them, I could not make them rise again.

make them rise again.

In the first week in November of this year a market shooter.

make them rise again.

In the first week in November of this year a market shooter, about three miles south of where the birds were put out, was crossing a stubble field when birds commenced to fly, and before he knew what they were he had killed three or four of them. They proved to be migratory quail, and, to use his own expression, "there was lots of 'em there." They may have been our birds congregated for flight, or, perhaps, they came from further north. I was surprised at their being found at this time, supposing that they had left us in September. This man told me he didn't want any more; they were so fat and greasy that he couldn't eat them, which, fact would go to show they found feed enough.

The following summer (1879) no end of reports came to us of the birds having been seen; and led us on many a "wild goose chase." Farmers would come in to say that they had seen one or more in their meadow, when investigation would prove them to be our native quail, meadow lark or upland after looking at a stuffed specimen was still more sure, said he saw then every day, and could have killed seven of them in a bunch that morning. After assuring him that he would have no trouble from the law and would be well paid for his time if he would kill one and bring it to us, he went off saying we would see him before to-morrow noon. Alasi it was like so many of the to-morrows. We have never heard from him since. Still another man that shoots, and whom we supposed knew all birds, was sure a pair was nesting in his mowing. He had seen the migratory quail before they were put out, and since. Still another man that shoots, and whom we supposed knew all birds, was sure a pair was nesting in his mowing. He had seen the migratory quail before they were put out, and thinking this a sure case, with a friend and two dogs (or call it with three friends) we went out and worked the needow carefully. Much to the gentleman's dismay we found nothing. He has since told me he never saw them again. In August of 1879, three of us with five dogs spent half a day looking over the country, and separating, covered a good deal of ground, but did not get a sect. of ground, but did not g

The year 1880 developed nothing; none were seen; at least we had no account of any. Last year, some time in August, one of the birds was left by a stage driver with one of our taxidermists to be mounted. Here surely was evidence, we

thought, and hopes were raised that they had returned. The bird was a genuine migratory quail, but either through the man's ignorance, or professed ignorance, in fear of the law, (it being the close season) not much could be learned. In fact we did not try to follow it up after being assured by the taxidermist that the bird's wings and feet gave evidence of having been caged for a long time, and no mark of it having been killed.

This brings me to the present time, 1882, the point where I

the taxidermist that the bird's wings and rect gave evidence of having been caged for a long time, and no mark of it having been killed.

This brings me to the present time, 1882, the point where I intended to begin this letter, and though the idea is not original, perhaps the advice would be good in this case, begin to read here, skip what has been written.

As many clubs as well as individuals, will soon receive invoices of these birds, I want to submit for consideration the policy of holding them over and liberating as early the following year as the season will allow. It has occurred to me that they, being captured on the way to breeding grounds, are probably very near the mating season, and the two months or more required for shipment and the journey may carry them past it. They are planted here and live contentedly until the season tells them to go—and they go. Where? perhaps to sca. They make long flights across the water in their mative land, possibly they try it here. It is the progeny of these that are to be our birds; and it is for ourselves to study how we can attain best results in this direction. I feel that the birds we liberated have not returned, and that they did not breed to any extent, and in making the statement I feel it my duty to show that we have made every possible endeavor to ascertain facts in the case, that the birds were a fine lot to start with, that we used our best judgment in locating them, and that they were watched over with fatherly care.

I trust no one will construe this letter into my trying to

in locating them, and that they were waters fatherly care.

I trust no one will construe this letter into my trying to discourage the importation. Far be it from my intention. I believe it a glorious work, and here we propose to keep on with it; and with at least a part of those which we get this season, we shall try the experiment of keeping through until the spring of 1883. If any correspondent can suggest a better plan I trust they will advance it at once.

WM. M. WILLIAMS.

SPRINGFIELD, Mass.

THE OLD GROUSE OF BARNEY'S SWAMP.

THE OLD GROUSE OF BARNEY'S SWAMP.

THE following is.a little experience that I had in my younger days in trying to down a flying grouse.

"Come, old boy, I have a job for you, if you think that you can kill a partridge on the wing," exclaimed George D. as be bounded into my room one evening. "I have been chasing him half the afternoon, and have fired at him half a dozen times and have not ruffled a feather! It was down in old Barney's swamp that I started him, and he would go from there down the ravine to the meadow and then back again. I followed him until dark, and Jack and I left in disgust. Will you go with me in the morning and help floor him?" Of course I would, and that settled it. George went home to wash out his old single-barrel muzzleleft in discust. Will you go with me in the morning and help floor him?" Of course I would, and that settled it. George went home to wash out his old single-barrel muzzle-loader. He was my trusted companion in hunting, and we had been fast friends from boyhood, and between us there existed a kind of friendly rivalry in wing-shooting. We had been "getting up practice" all summer, and numerous blackbirds, chimney swallows, bluejays, etc., had come to grief thereby, when they happened to fly over within range. George had an 8-bore gun, and the barrel was short; it would throw shot well, but would make a tremendous racket and kick like a mule. I had a double-barrel, nuzzle-loading, 13-gauge, light bird gun that shot indifferently, and sometimes both barrels would go when I intended to have only one.

and kick like a mule. I had a double-barrel, muzzle-loading, 13-gauge, light bird gun that shot indifferently, and sometimes both barrels would go when I intended to have only one.

Next morning bright and early George came along, and with him came Jack, his half-broken bird dog. Jack would find a bird if there was any around, and would point it as well as any dog, but as soon as the bird was flushed he would chase it and yell (well, perhaps there was "musie" in it, but I never heard it), but if it was wounded he would earch it and bring it in so carefully that he would bardly ruffle a feather. We started for Barney's swamp. It was a bright frosty morning in October, just the kind of a morning to set the blood a-bounding through a fellow's veins and tone up the nerves—one of those mornings that we would select if we were going to have one made to order. The fields were white with frost, and as the millions of diamonds sparkled upon their surface, they formed a lovely contrast with the variegated colors of the autumn leaves; and the maples, as the king of day showered his dazzling light upon them, seemed to be capped with a crimson crown and clothed in a garb of golden glory; and—and—nonsense, you know what such a morning is yourself. But it was "that old cock partiage" and not the maples that we were after. Having crossed the last field we stopped and loaded up. George turned out what looked to me to be an enormous quantity of powder and shot, and with huge wads of old uswspaper completed the operation of loading his cannon. I had joked him a great dead about his artillery, but he said that he would show me before night what that "field piece" would do. And he did. We had gone but a short distance when, near the edge of a "sprout lot," Jack came to a point. George and I walked up just in front of him, and up went a flock of about fifteen quail. When about twenty-rive yards distant we both fired at nearly the same time; the air was as "sitt in singled out one that started off to the left, and with the left barre

about four feet into the air, and the next moment Jack was shaking him at a great rate—"punishment after death," George called it.

George called it.

We soon arrived at the meadow. Jack winded the bird and George flushed him in the alders. Away he started back toward the swamp where we first started him. George "inhitched" on him, and as he came tearing out of the brush, making as much noise as the down express train that had just passed us, I pulled trigger—a miss-fire! Following him up with the lead three feet ahead, I gave him the left and scored a blank. Jack was after him, shricking like a demon, and I think that I am putting it very mildly when I say that that bird was frantic, and, as George expressed it afterward, "the way he plied his oars up through that hollow was a caution."

and I think that I am putting it very mildly when I say that that bird was frantic, and, as George expressed it afterward, "the way he plied his oars up through that hollow was a caution."

"Well," said George, "what are we going to do about it? Does that bird bear a charmed life, or is he so old and tough that lead will not penetrate him?" "Give it up," I amswered. "Well, I won't," said George; and as he said it he placed the plug of his powder-horn between his teeth and jerked it out in a manner that told plainer than words that his "dander" was up and that he meant business. "Good heavens!" I exclaimed, "you are not going to shoot that charge of powder, are you?" "Yes, and two ounces of BB shot. I am going to try a fox charge on him, and see if he will carry BB's away as he does No. 8. That is what is the matter, our shot is too small."

Back we went up the ravine, and when we reached the swamp we hunted all around and the dog worked the ground all over, but did not find him. "Perhaps he has treed up in one of those trees," suggested George; and he was right again, for upon looking up, there stood the bird upon a limb close to the body of the tree, as noble-looking a grouse as ever I saw, with his ruff glistening in the sunlight. As we neared the tree, off he went. At the same instant our guns flew to our shoulders, and I never, never, shall forget the deafening report made by that "fox charge." George staggered back two or three steps, and stepping on a round stone, his feet flew out from under him and down he went, flat on his back. He said his cheek was "pounded to jelly" and the middle finger of his right hand was skinned by the trigger guard. But what a change came over his countenance as he looked up and swe those feathers come floating back through the air, and a moment later Jack, with his stern a-awaving, brought the old grouse and laid him in George's hand! My friend soon forgot his bruises and loaded up again, but not with a "fox charge." On the way home I downed two grouse in cover, and George ki

Helitor Forest and Stream:

This treeing vs. wing-shooting subject is getting monotonous; still please allow me to fire a random shot in answer to the withering fire that has been directed against our side of the house. We game exterminators have one consolation—viz.; if some wing-shooters tell the truth, we are not as deadly, with all our pot-hunting tendencies, as they are with their more refined method of killing. If ever there was a dog that could tree one out of three grouse in our woods I have yet to see him; and I have seen six consecutive grouse rise in second growth timber before a good dog and fly over the hills and far away, with two guns ringing out angry protests at their behavior.

A word about that caribou comparison. A caribon especially supported the second control of the second con

see him; and I have seen six consecutive grouse rise in second growth timber before a good dog and fly over the hills and far away, with two guns ringing out angry protests at their behavior.

A word about that caribou comparison. A caribou, especially when feeding and not aware of the presence of an enemy, has an alluring habit of attending to his own business (one that should be copied by some bipeds) and a gun, yelept a rifle, was invented some years ago which will perforate him with the same deadly effect at twenty road sitsance that the breech-loader does the grouse at twenty yards; but our friend neglects to say positively that we should start him before turning loose the bullet. Of course, the theory that the sense of honor and fair play should inform us intuitively where sport ends and murder begins is all very fine, but, you see, "intuitions," like doctors, differ, and what right has any one man to set up a standard and then to stignatize as a pot-hunter his less skillful fellow who declines to recognize it? Rev. W. H. H. Murray, the man who tells the Phanton Falls ghost story, says that "shotguns are a nuisance and a pest." Now suppose some person holding this view should write to Forest and Stream to this effect, "You should shoot grouse on the wing with a .40 cal. rifle. It is easily done if you shoot 'quickly and straight,' for the ball has to go somewhere, and, no matter if you only visit the woods a dozen times a season, you can keep 'in practice' by facing a thundercloud and trying to follow with your rifle the scintillations of a lubricated streak of chain lightning. As for thick cover, where there are thirty trees the size of your arm to the square rod, that is all a coloweb of the pot-hunter's brain. You only have to 'carrom' on any number of gray birch saplings and knock the bill off the bird and the thing is done. And then, you know, good friends, there is the sweet sesthetic delight, the too utterly ut—ah, you know, that too positively bully feeling which a man experiences when viewing a d

netting trout and shooting a single sitting bird I can't see. I would rather be the man who would frame a set of rules for any of the above than one who resorts to his imagination for his facts and springs the result upon the readers of a respectable paper in an attempt to fix a number of Falstafilan vices on a class of hunters whose ethics are probably not a whit behind his own. I sympathize (slightly) with our friend in his Archimedean effort; but even with his gall-tipped pen as a lever, and the English vocabulary, with some borrowed departures (such as lollipop), for a fulcrum, I fear that he will fail to move the world perceptibly till he spices his arguments with logic instead of epithets.

Yes, boys, let us shoot on the wing when we can, and neither despise small beginnings nor sneer at persons who happen to be naturnly less skillful than ourselves. Then, perhaps, there will come a time, a glorious time, when we will stick our sunflowers in our hats, shoulder our lightning concentrators that shatter black birches the size of a barrel and join the ranks of the æsthetic shooters, who love to commune with nature, weighted with their guns and little hatchets, and care nothing for "bag." A murderer can be tried forty years after the commission of the deed. Now one question to our "exclusive" wing-shot champion. Tell us true—did you never take a sitting shot? If you deny it and expect the "young and rising generation" to believe you, please make your denial slightly Pinaforical.

Just one cheery word with the boys, as I pass through the office this morning. Let me say to "Graeme" that I can see by the sly twinkle of his dancing eye that he does not mean half he says, and has no sort of idea that I am such a "bear," that I wouldn't wish one to enjoy his day's "outing" to the full. Some day when I have more time I'll tell what had occurred the other day when he thought that I rather "boiled over," and perhaps unintentionally bespattered some of my friends over," a friends.

over, and perhaps unintentionally bespattered some of my friends.

Now, he cannot deny that he has underside a strong vein of that true sportsman's blood, that when fairly awakened to action, would at once perceive the richer flavor of the quality of the sport so well described by "Shadow," in "A Day with the Ruffed Grouse" (in issue Nov. 17), and having once tasted thereof, would scorn ever after to go back to the husks.

I have one word of friendly warning for "Graeme's" ear alone. Hold close lest the passing winds whisper it.

By all means get patented at once the original idea—that shooting a bird on the ground just under a pointing dog's nose, conduces greatly to his staunchness. Don't delay, for the fact is, staunchness is so much more highly valued than it was in the "times primeval," that if it should attract the notice of some of these field trial chaps, they might be tempted beyond their honor and slip in ahead of you on the patent. There, there, no thanks; do as much for some one else.

notice of some of these field trial chaps, they might be tempted beyond their honor and slip in ahead of you on the patent. There, there, no thanks; do as much for some one clse.

Here, too, is "Tron Ramrod" at his noble work, sowing the precious seed. Let him not be discouraged if some does fall on stony ground or gets choked by thistles, but remember the outcome of that same grand old parable. By the way, about being obliged to hold further ahead when shooting to the right, is it not caused by the cramped position of the right arm in shooting, preventing as easy delivery in that direction? Perhaps plenty of practice at right-crossing shots from the trap would limber up the action some.

The partial migrationists can have my "aye" every time, as demonstrated by my constant observations for years over a large tract of ruffed grouse country. A bird that will raise to maturity a large brood of young and then suddenly disappear with them all from that section of country and after a few months as suddenly reappear perhaps in full force or with additional forces can, I think, be safely called a bird of migratory habits, whether it be for greater or lesser distances, or for food or other causes, though climatic changes seem not to enter into the problem of its movements.

In regard to the vermin question I would ask, has anyone seen the red squirrel show any disposition to molest the grouse or its young or eggs? I have yet to learn that grouse destroying vermin (with the exception of the pot-huntry) exists in greater proportion to the grouse than it did twenty-five vears ago, when both were plenty. If so, it would seem that to some other cause must we look for the extermination of this noble bird. And as the above exception (whose destructwenss no one questions) has increased in full proportion to the decrease of grouse, is it not reasonable to charge this great wrong on him? If so, there would seem to be but one alternative, and that—the grouse or the pot-hunter must go. Shall it be the grouse?

Ashfield.

was with much pleasure that I read "Mark West's"

Ashreed, Mass.

It was with much pleasure that I read "Mark West's" article on wing versus ground-shooting. I, too, am sorry that "Octo" killed those two birds upon the ground.

May I ask why a sportsman should consider himself justified in shooting a grouse upon the ground or from a tree, when he would scorn to do the same thing to quail or wood-cock or any other of our game birds." The better the shot the more to blame, for the less chance the bird has upon the ground the more chance the sportsman has to secure his game in a legitimate way. Is it not a confession that his skill is not sufficient to give the finest game bird we havefair play for its life? If he would stop to consider as he throws his gan to his shoulder for the purpose of murder—for murder its—there are few sportsmen I inagine who cannot hit a bird on the ground or perched on a tree within twenty yards, and one is not likely to see a grouse further off—if he would stop to consider, I say that he is putting himself on a par with a pot-hunter, I think he would resist the temptation.

Why, because a bird is difficult of approach and hard to kill (and no one knows better than I that the ruffed grouse is both) should we take an unfair advantage?

It puts me in mind of an old story of a French and English sportsman. The Englishuan seeing his companion about to shoot at a bird running upon the ground, indignantly exclaimed: "You would not shoot a bird upon the ground, would you?" The Frenchman complacently replies: "No, I vaits tele he stop." And after he does stop and is killed, I ask my brother sportsman does he not pick him up rather quickly and thrust him in his pocket and walk away with an uncomfortable feeling about the gills, when his friend shouts from the other side of the brush "Why did you not say "Mark which way did he go? I did not hear him."

In my opinion better flush him, if it is in the thickest hole that les between New York and the Canada line; let him do his best; let him sneak away till he rises out of range, or put all the big t

broken) dog comes to his point; it is thick to be sure, very thick; you send your companion on the outside where you think he will have a fair shot; you force your way through the brush to your dog, up gets the grouse, you have but a glimpse and shoot where you heard bim last; you have no idea whether you have killed or missed, you have both had fair play, but if your dog returns with the bird you don't stuff him in your pocket in a shame-faced way, but carry him out to your friend and when he says, "What a magnificent shot that was, I don't see how you do it'l you stroke his feathers and are proud of your bird and of your shot. My gentle reader, if you would give that bird for a cur load slaughtered upon the ground you do not belong to our fraternity. Yes, brother sportsmen, I am with "Mark West" first, last and all the time, and so put myself on record. broken) dog comes to his point; it is thick to be sure, very

RHINEBBCK, N. Y.

NEW YORK STATE ASSOCIATION.

NEW YORK STATE ASSOCIATION.

The following circular has been issued by Mr. S. T. Murray, of Niagara Falls, president of the New York State Association for the Protection of Fish and Game:

"At the Convention of the New York State Association for the Protection of Fish and Game, held at Concy Island, June 20, 1881, Capt. W. L. B. Stears offered the following resolution, which was adopted:

"Resolved, That a Convention be held at the call of the president elect, who shall decide the place as well as the time of meeting, for the purpose of taking action in the protection of game and fish, and preparing a new game bill for prosentation to the Legislature, and that each county be represented by one delegate; with the addition made by Mr. James Faulkner, Jr., which was agreed to, that the president should also have power to fill any vacancy when any county was not represented, and to act with the others; and addition from Mr. W. J. Balcock, which was agreed to, that when the meeting convened a majority should rule.

"In appointing the following delegates we have been obliged to select some gentlemen whom it has been impossible for me to confer with before such appointment was made. It is hoped that this will make no difference with the attend ance of these gentlemen upon the Convention.

"If the anticipation is realized, that one gentleman from each county be present at the Convention (which is very much desired), we may expect that a good game and fish law—such as the whole people may readily understand, and that shall be fair and just to all—may be passed by the present Legislature and become a law, There are so many conflicting laws at present that it is difficult to enforce them or for the people to understand them. Again, some of the laws are unjust to dealers, and do not reach the end songht. I haven amed the Delayaa House, in the city of Albany, as the place of meeting, and the 15th day of March next, twelve o'clock noon, as the time for such Convention to convene; also have named Capt. W. L. B. Stears, of Bro

The next meeting of the State Association will take place Gagara Falls, N. Y., of which timely notice will be given.

Y., as temporary chairman. All communications with retrence to this delegation should be addressed to Capt. W. L. B. Stears.

"The next meeting of the State Association will take place at Niagara Falls, N. Y., of which timely notice will be given. Any information relative to organizing new clubs and sending delegates (thereby having a representation in the Convention of the Association), will be promptly responded to by the Hon. William Pool, corresponding secretary of the Association, Niagara Falls, N. Y."

The list of delegates given is as follows: Dr. Kennedy, Auburn, Cayuga co.; Henry R. Jones, Buffalc, Eric co.; R. Ballard, Le Roy, Genesco co.; Dr. E. L. Sargent, Watertown, Jefferson co.; R. J. Richardson, Lowville, Lewis co.; James Faulkner, Jr., Dansville, Livingston co.; M. A. Stearns, Rochester, Monroe co.; Hon. R. B. Roosevelt, New York, New York co.; C. W. Hutchinson, Rome, Oncida co.; John Bedford, Syracuse, Onnonlaga co.; H. R. Tiffany, Clifton Springs, Ontario co.; G. D. McManus, Oswego, Cowego co.; C. A. Havenneyer, Hempstead, Queens co.; A. Paul, Troy, Rensselaer co.; Frank Endicott, Staten Island, Richmond co.; Horace Silsby, Seneca Falls, Seneca co.; C. Victor W. Ringueberg, Lockport, Ningara co.; J. Otis Fellows, Hornsville, Steuben co.; Dr. Morgan, Ithaca, Tompkins co.; W. H. Griswold, Lyous, Wayne co.; Charles E. Johnson, East Chester, Westchester co.; Calvin Russell, Penn Yan, Yates co.; Geo. Dawson, Albany, Albany co.; John R. Wiltsie, Newburg, Orange co.; Louis Livingston, Rhinebeck, Dutchess co.; H. G. Scudder, Harrington, Sqirlok co.; Ezakiel Elting, Highland, Ulster co.; P. D. Van Olinda, Canajoharie, Montgomery co.; F. D. Bump, Jr., West Randall, Washington co.; Albert Bush, Hudson, Columbia co.; S. A. Kellog, Champlain, Clinton co.; W. W. West Randall, Washington co.; Albert Bush, Hudson, Columbia co.; S. A. Kellog, Champlain, Clinton co.; W. W. West Randall, Washington co.; Albert Bush, Hudson, Columbia co.; S. B. Stebbara co.; E. W. Thayer, Cooperstown, Otsego co.; B. M. Stebbins,

Tennessee Notes.—Nashville, Feb. 7.—Near Eagleville. Bedford coupty, in this State, can be found more quail than anywhere I have heard of. The natives never hunt, and consequently Bob White has the field to himself. John Carter, Felix Mitchell, Dr. Briggs and Col. Griffith, recently visited this sportsman's bonanza, and though the weather was most unfavorable and Col. Griffith's gun got broken early in the action, they brought home full bags. From Trigg county, Ky. Matt McKinney writes to Col. Geo. F. Akers that turkeys were never so abundant in the cooling grounds as this winter, and invites him and "J. D. H." (6 come down and have a go at them. Deer are also to be found there in large numbers. Geo. Wharton keeps a first-class pack of hounds, and is ever ready to have a run after them. Our market is pretty well supplied with game, but not as well as usual at this season of the year,—J. D. H.

TRAJECTORY CURVES OF SPORTING RIFLES.

THE LAWS GOVERNING THEM

WOULD like to correct a few typographical errors in the text to the table of "Trajectory Curves," published in your issue of Sept. 1st, 1881. Occasion will be taken, at the same time, to claborate that text, in order to correct some erroneous teachings, on projectile science, frequently appearing in the sporting papers.

These experiments were made for my own satisfaction, and required more than a month's laborious care. The results were very satisfactory, and amply repaid me for the time and expense incurred, and were afterwards published to counteract the absurd claims of some riflemen, who, imaging the laws of nature temporarily suspended for their especial benefit, are still convinced that their particular rifles shoot "straight."

suits were very sinstactory, and minply repaid me to the time and expense incurred, and were afterwards published to counteract the absurd claims of some rittemen, who, imaging the laws of nature temporarily suspended for their special benefit, are still convinced that their particular rifles shoot "straight."

To the mass of persons using the ritle such experiments possess but little interest. They are at a loss to understand why any one should spend mombs among the mountains, undergoing what they consider hardships, except for the mere killing and slaughter of game; and then, to see one spending weeks, apparently busy and hard at work all the time, merely shooting through thin paper servens, why, there is only one thing about it, he must be "rattled." Using some standard rifle, and the ammunition formished with it, they are entirely satisfied if the ammunition goes through the box of powder and ball on that curve, they have not the remotest conception. Occasionally making a hit at good long range, they are delighted, and do not som cease talking about it, though at the time they may have been holding a foot from the point hit. Arises is generally accounted for." It has the summary of the contraints of the contraints of the contraints of the contraints of the principles of projectiles they take but little interest, as the pure but little knowledge of them; and this remark will frequently apply to persons highly educated on general subjects, and it is therefore the more pleasant to have such flattering commendations on one's labors, from such a veteran rithen as a subject such as the pure but little knowledge of them; and this remark will frequently apply to persons highly educated on general subjects, and it is therefore the more pleasant to have such flattering commendations on one's labors, from such a veteran rithen as a Major W. H. Merrell, as contained in your issue of Sept. Stlt; a rifleman who combines such correct theoretical knowledge with extended experience in the field. I am sorry that the informat

ence varies as the square of the diameter in inches, divided by the tweight of bull in pounds, or as d². In the case of No. 1 the co-efficient of resistance is 6.77, and that of No. 4, 2.577, which will account for much of the difference. A part of the difference in these two curves is accounted for by the 8-inch longer burrel of No. 4, in accordance with the results of experiments of the U. S. Ordnance Department, as shown in abstracts of ordnance notes given by myself in previous numbers of Forest and Stream. Major Farley's experiments indicate that, with service ammunition (70-405 grs.) and below 22 inch (carbine) length of barrel, the initial velocity increased very rapidly up to that length. From 22-inch length, with initial velocity of 1,210 f. s., there was a gradual increase up to rifle length (32.6 inches), initial velocity 1,320 f. s.; and from that to the 90-inch length a more gradual increase up to rifle length (32.6 inches), initial velocity 1,320 f. s.; and from that to the 90-inch length a more gradual increase up to rifle length (32.6 inches), initial velocity 1,320 f. s.; und from that to the po-inch length a more gradual increase up to rifle length (32.6 inches), initial velocity 1,320 f. s.; und from that to the modern of rifle length over carbine length, 110 f. s. Powder used, musket powder, a slower lurning powder than F. G. American powder, or the quicker and stronger Curtis & Harvey brand. It is probable that with the latter quicker brands the maximum velocity would be obtained, with a less length of barrel than 112 inches, but it is doubtful whether the above difference of velocity would be changed between 22 and 33.6 inch length of barrel.

Another well-established law of projectiles is what is known as "the cubic bus of resistances" that is, with diameter and weight of ball constant, the atmospheric resistance va-

ries as the cube of the celocity. This law was carefully tested by Professor Bashforth, who, from careful and exhaustive experiments by means of his electric chronograph for five years, whilst a member of the British Ordnance Committee, established that this law held good only at a velocity of 1,200 f. s. Below, as well as above, that velocity, the atmospheric resistance was less than the cube of the velocity. For instance: the co-officient of resistance, established for the ogival-headed and kindred forms of projectiles, were 108.9 for 1,200 f. s.; 75.0 for 1,000 f. s.; 104.0 for 1.400 f. s.; and \$8.9 for 1,700 f. s. With spherical projectiles, 15.4 for 1,200 f. s.; 141.1 for 1,000 f. s.; 141.3 for 1.400 f. s.; 120.8 for 1,700 f. s.; and 103.9 for 2,000 f. s. These figures indicate the relative atmospheric resistance of the light (in proportion to calibre) spherical ball and the heavier, elongated, conical ball, of same calibre.

Another important law of projectiles is that governing the drop of the ball from the action of gravity. A ball falling freely through space, near sea level, falls 16,09 feet during the first second, and with an accelerated velocity, at the end of each subsequent second, of \$2.19 feet per second. This holds good, whether the ball is suddenly released from a state of rest, or whether it is propelled from the bore of the rifle. Its drop will be exactly the same in each case, in the same interval of time. Although this law is deduced from experiments at such a slow velocity that its application is only theoretically correct in a vacuum, yet the velocity of a lead or iron ball is so slight, during the lirst few seconds of its "drop," that the resistance of the air can be disregarded. The drop of a ball "is as the squares of the times," which is concisely expressed in the formula—

 $h = \frac{1}{2} g t^2$

in which h represents the drop; $g=the\ gravity=82.19$ feet, Greenwich standard; and t=time in seconds.

A great deal of "bosh" has been lately printed about the time required for gravity to overcome inertia. As this formula is based upon careful experiments, in which this element of inertia entered, it of course includes that infinitessimal intervals of time.

inme required for gravity to overcome merita. As this formula is based upon careful experiments, in which this element of inertia entered, it of course includes that infinitessimal interval of time.

But for the resistance of the air, a ball propelled from the ritle in a horizontal direction, would pass over equal spaces in equal times, and its curves, in that case, would be a parabola, and the ordinates, for instance, at 50 and 150 yards of table, would be equal. But the atmospheric resistance acting upon the ball, and constantly decreasing its velocity, changes all this, and the descending branch of its flight is considerably more curved than the ascending branch, the ordinates at 50 yards (see No. 1—ordinate 9.70) and at 150 yards (see No. 1—ordinate 9.70) and at 150 yards (see No. 1—ordinate 11.25) being very unequal.

Experiments pretty thoroughly show that with the same calibre and length of barrel, "as long as proportional weights of powder and ball are preserved, the initial velocities are practically the same." This appears to hold good, even with different calibres, where the calibre and length of bore are so proportioned as to thoroughly utilize the powder and ball; and to hold approximately, even with the heaviest ordnance, a proportion of \$\frac{2}{7}\$ powder in the .45 calibre, producing an initial velocity of about 2,000 f. s., and the same powder proportion, in the largest rifle camion, with the 700 lb. ball, producing a like velocity.

Mr. T. S. Van Dyke has written a very readable and most instructive book on the art of hunting deer, "The Still Hunter," which shows him to be a master in that art. He has, however, embodied in that book and in certain communications to the sporting papers, certain opinions and news in projectile science at variance, in my opinion, with the well-developed laws heretofore alluded to, and which I propose to point out. He says: "The line of flight of a ball or 'trajectory,' as it is generally called, may be very near predicted, a prior, or without experiment, by ine

'trajectory,' as it is generally called, may be very near predicted, a priori, or without experiment, by inevitable deduction from a few of the principles of natural philosophy." Whoever attempts to trace the flight of a ball in this mauner, will surely come to grief, as the author has naturally done. The science of projectiles is an exact science, and its laws have been gradually developed by the most careful and exhaustive experiments for the past one hundred years, and the results worked out into a practical form by the higher mathematics. The formulæ, embodying the elements controlling the flight of the rifle ball, contain certain elements representing the resistance of the air and the action of gravity, which are called constants, and those can alone be determined by careful experiments. Without fixing a mathematical value to these constants, these formulæ are entirely useless in fixing this curve; and reasoning a priori would be expending thought in vain, as far as any practical results are concerned.

The law governing the action of gravity has long been authoritatively known; that governing the resistance of the air was not so easily determined. As early as 1742 Robins, and during 1783-91, Hutton experimented for this law with the ballistic pendulum. In 1839 and 1840 MM. Piobert, Morin, and Didion, under authority of the French government, made similar experiments with an improved ballistic pendulum, and the results of the two setts of experiments are said to have agreed very closely.

During the years 1865-1870, however, the most important and elaborate experiments were made by Professor Francis Bashforth (heretofore alluded to), by means of his electric chronograph and a succession of screens placed at 50 yards intervals. Extended experiments were made by Professor Francis Bashforth (beretofore alluded to), by means of his electric chronograph, enabled him to affix correct values to the atmospheric resistance for ogival-headed and kindred forms of projectiles, for all velocities from 900 f. s. to 1,70

yards and 200 yards of balls from those rifles developing the flattest curves during these trials. By way of comparison and for future reference, is given the drop Mr. Van Dyke claims for his .65 calibre, spherical ball, as will hereafter appear, as well as the curve calculated for same ball. These rifles all used as large, or larger, powder proportions than the .65 calibre, and all, except one, used conical balls. And yet he believes and informs us farther along that his .65 calibre, spherical ball, with about the same initial velocity "has no perceptible drop up to 120 yards," the most rapid of these having a drop of 6½ inches at 100 yards:

	Calibre.	Initial Velocity.	Drop 50 vards.	Drop 100 yards.	Drop 200 yands.	
500.	solid	1810	1.49	6.54	82.00	
500,	hollow	1796	1.56	6.97	35.17	
577,	spherical	1950	1.36	7.64	49.0	
	hollow		1.56	6.83	34,07	
	hollow		1.50	6.56		
	spherical			1.00	20.00	
65,	calculated	1815	1.64	8.12	47.52	
			1.9	2		

.65, calculated...... 1815 1.64 8.12 47.52 A study of the experiments with their results of those who have gone before us, is sure to save one a world of doubt and tribulation, into which one is sure to drift if he attempts to arrive at practical results by "reasoning a priori," with no such facts as a base.

Mr. Van Dyke's first error is in stating the resistance of the air to vary as the calibre (diameter), instead of as determined.

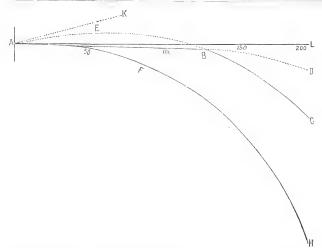

of the air to vary as the calibre (diameter), instead of as $\frac{d^2}{W}$. His next false position is as to the action of gravity "in the first interval of time, after leaving the bore." My understanding of his first position is that his .65 calibre rile, with 150 grains of powder, will drive a $437\frac{1}{2}$ grains spherical ball so rapidly that it will not drop up to 50 yards. A discussion has arisen, but it is my understanding, his position is the same, for in Chapter XXII of "Still Hunter," we find: "So high a speed may be given to the ball, that during the first small fraction of a second after the ball leaves the muzzle, in which there is no dornward motion (italies mine) it may be driven as far as eighty (80) yards, before its full is noticeable, even to the most careful inspection," meaning of course before its "drop" can be measured on a target, as it is impossible to trace the ball with the eye. Again, a little farther on, we find: "On the other hand, 150 grains behind the ounce round ball, C * * * * will drive the ball square through a two inch bull's-eye at 100 yards, will have no perceptible fall even at 120 yards; at 160 yards will not drop more than 6 or 8 inches, and at 200 yards, little more than 18 or 20 inches." The evident meaning of this being, that up to 100 yards the drop will not exceed (1) one inch, and slightly more at 120 yards. This is claiming more than the letter causing the discussion. This is claiming more than the letter causing the dis-

yards. This is claiming more than the letter causing the discussion.

The theory of the instantaneous effect of gravity on the ball as it leaves the muzzle is too well established at this day to bear discussion, and if discussed at all, can only be classed with such questions as the following, that periodically consume space in the Fonest and Stream—"Do deer bury their horns ?" and "Is the spike buck a sept rate species of the cervidæ." All the arguments are on one side.

My object in alluding to it at all, is to suggest to the author that he may be arguing from false premises. The only correct way of measuring the drop of the ball, for small intervals of time, is either by an electric chronograph, the most certain, or next, by means of carefully arranged paper screens, each of which methods require the greatest care. My inference, however, is that Mr. Van Dyke formed his opinion by sighting the rifle for 25 yards very carefully, then loading with exactly the same charge, and with the same sight shooting at the 50 or 100 yard target, the ball hitting so near the point aimed at, that he considered there was no drop to the ball. A moment's reflection will show how erroneous deductions from such premises may be. In the first place, it would be almost a miracle to obtain exactly the same velocity from two different charges, however carefully weighted. In the second place, it is almost impossible to hold the same, or to sight the same, in two consecutive shots. An error of (.01 inch) one-bundredth of an inch in either would make an tions from such premises may be. In the first place, it would be almost a miracle to obtain exactly the same velocity from two different charges, however carefully weighed. In the second place, it is almost impossible to hold the same, in the sight the same, in two consecutive shots. An error of (.01 inch) one-hundredth of an inch in either, would make an error for 50 yards of about \(\frac{1}{2}_{\text{inch}}\) inch, with a 28-inch barrel (24-inch between front and rear sight). I have experimented in this manner a great deal to obtain trajectory curves, and always found it very unsatisfactory and resulting merely in rude approximations. This is the reason why the suggestion is made that false deductions may be made from erroneous premises; from very unreliable experiment especially, as he speaks in same chapter of his want of facilities "for making correct measurements." I am convinced this is the case in this instance, for it is evident to my mind from what follows that the author is entirely "at sea," as to what trajectory curve his ounce ball does make. Take the claim made in quotation before given, that 150 grains powder will "drive the ounce spherical ball square through a 2-inch bull's-eye at 100 yards, will have no perceptible fall even at 120 yards," etc., etc., and taking the most favorable view of it for his theory, (that the drop is (1 inch) one inch for the first 100 yards, and we figure out an average relocity for that range of 4,150 feet per second, the fine required for passing that distance being (.0719 second), say seventy-two thousandths of a second. This will require an initial velocity of about 4,500 feet per second. The impossibility of accomplishing such a feat with a powder proportion of 1 to 2.91 will be the more apparent when it is stated that the highest velocity attained with the small bores is 2,150 feet per second, with powder proportions of 1 to 1.75.

Any ball with such a fearful velocity as to fall only one inch in the first, 100 yards, would almost pass over equal spaces in eq

150 grains, this initial velocity should be over the mark, especially as a much stronger powder was used than American powder. Below is the curve, showing drop of ball at each 25 yards interval, and then the curve arranged for a point blank of 200 yards:

.65 cal., 437½ grain ball. Initial velocity, 1,815 f. s. Barometer. 30.00 inches.

r testing it. Herewith is a diagram drawn to scale, showing more par

for testing it.

Herewith is a diagram drawn to scale, showing more particularly the different curves above described.

A B C is the curve, as chalked out by the author. A B D the curve as its initial velocity would indicate. A E B C is the curve "suggested" as having been made by the ball, with A K the line of bore, prolonged A F H the calculated curve. It will be seen that the calculated curve does not differ a great deal from the "suggested" curve, the latter dropping 40 to 45 inches and the former 47 inches. A little higher elevation than sea level and a more careful statement of the curve, as claimed, would probably bring them very closely together. Af any rate, this looks to me as a solution of the difficulty, in regard to the author's supposing this particular hullet holds up very near level to 120 yards, the ball really rising 2½ inches at 50 yards.

But Mr. Van Dyke, as well as others, may very naturally suggested doubts as to the correctness of the calculated curve. My reply is, that taking his own figures, his clain to a curve straight up to a certain distance, has been proven an impossibility, and a suggestion is made which will prove my calculated curve a near approximation to the true one, and at the same time offers a correct solution to the difficulty. The calculated curve as based on experiments, and to show how close a calculated curve can agree with an actual curve, obtained through screens, I have taken curve No. 9, of the tables given in Forkest AND Stream of Sept. 1, found out by means of its known ordinates its initial velocity and thence calculated the curve. The two are given together and comparison is readily made. is readily made.

Range in yards... 25 50 75 100 125 150 175 200
Achael curve of No.9 4.74 8.65 10.61 11.30 10.64 8.75 5.08 0
Calculated curve... 4.42 7.88 10.20 11.25 10.90 9.16 5.76
Difference... — .32 — .17 — .31 — .05 + .26 + .41 + .49

Again, in same chapter, in comparing the curves made by the three balls A B and C, all of 487½ grains weight, and of .65, .55 and .44 calibre, respectively, and propelled by 100 grains of powder, he starts out with the assumption that the .65 calibre spherical ball will have the highest initial velocity, though all having the same propulsive force. On the supposition that each ball is thrown from barrels of length suitable to utilize fully the 100 grains of powder, it is clear to my mind, and agreeable to experiments, that they will all start with the same velocity. The .44 cal., with co-efficient of resistance of 3.09, will gain on the other two at every instant, and reach the 100 yard point in .217 second, and the 200 yard point in .463 second. The .55 cal. ball is next, with a constant gain on the spherical ball, with co-efficient of resistance of 4.84, reaching the 100 yard point in .226 second, and the 200 yard point in .498 second; and the .65 cal., with co-efficient of resistance of 6.75, passing the 100 yard point in .247 second, reaches the 200 yard point in .581 second. The drop at the 200 yard point of these balls being 41.76 inches, 47.99 inches, and 65, 66 inches, respectively. Initial velocity of each assumed at 1,480 f. s. pressure of air, 30.00 inches of mercury. If I understand the principles which these examples are intended to illustrate, they are equally as erroneous as the illustrations. Several more comparisons are made in the same chapter between the .44 conical and .65 spherical ball, mostly to the disadvantage of the smaller bore.

If my figures above given are correct, of which I have no doubt, the .44 cal. ounce ball, with 100 grains powder, though starting with a velocity 335 feet less than the .65 spherical ball of sams weight, will reach the 200 yard point in less time, .496 — .465 — .031 second, and have a flutter trajectory. This will be the less wondered at, when in addition to the greater atmospheric resistance from the difference of calibres, the relative resistance from the d

STINKING RIVER, Wyoming, Nov. 11, 1881.

I observe in your last number a notice that "an article from 'P.' on the 'Trajectory Curves of Sporting Rifles' will be published in our next issue," Feb. 16. I am highly pleased at this. His articles, always abounding in solid facts, are invaluable contributions to your excellent paper. "P." is not one of those who write from mere guess work, but he states the facts as he has actually proven them to be. He also writes without partiality for any one rifle, but brings each in to receive the reward it is entitled to after the impartial experiments he has made with them all. This is as it should be, and I bespeak for his article a happy reception. In "P." we see combined the essential qualities of a skillful sportsman, an educated theorist, and an impartial experimenter with the rifle. He is a good authority, for he thoroughly understands his subject, and in this respect has never been surpassed by any one who has contributed to your columns. I say this, not to flatter him, but in behalf of the science of rifle shooting, and of the facts he sets forth for the information of others.

New Rochelle, N. Y. information of others. NEW ROCHELLE, N. Y.

Halifax, N. S., Feb. 10.—The annual meeting of the Game and Inland Fishery Protection Society, of this city, was held on the 7th inst. The report of the year's work showed that the Society had been very active, succeeding in convicting many offenders against the game laws. Officers elected for the ensuing year: President, Robert Morrow (reelected); Vice-Presidents, Lieut, Col. Clerke and E. G. Stayner; Secretary-Treasurer, A. E. Harrington (reelected); Council; M. B. Daly, Peter Jack, Andrew King, C. R. Barry, Capt. Cooke, R. M. Fusiliers; Capt. Eden, ist Yorkshire Regiment; Hon. L. G. Power, Capt. Boughey, Lieut. Wrottesley, R.E.; Capt. Lane, R.M.F.; Oswald Pryor and C. S. Harrington.

Long Island.—During the last warm spell redheads and broadbills came into the bay at Good Ground, L. I., and several of the old gumners prophesy good shooting this spring as soon as the bay opens. It is said that Lane will run two rigs of live decoys this spring besides three batteries for duck

Proposed Wisconsin Deer Law.—The following bill has been introduced into the Wisconsin Legislature. It has been prepared by earnest and experienced men, and ought to become a law: "Section 1. No person shall at any time take, catch, kill or destroy any deer for any purpose, except for consumption thereof as food, within this State. Section 2. No person, company or corporation shall take, catch, kill or destroy any deer, or have in possession any part of the carcass of the same for consumption as food, within this State, except during the months of October and November in each year. Section 3. No person, company or corporation shall expose for sale or have in possession, except alive, at any time, any deer, or any part of the carcass of the same, with the intention of sending or transporting or having the same sent or transported beyond the limits of this State. Section 4. Every violation of any provision of this act shall be a misdemeanor and shall be punished by a fine of fifty dollars, and any person so offending shall, on conviction and in default of payment of such fine, be committed to the county jail until such time, not exceeding thirty days, as such fine shall be paid."

Chicago, Feb. 6, 1882.—The "Sportsman's Club," of this city, has just completed its new club house and boat house on its grounds at Thayer's Landing, Indiana. Thayer's Landing is on the Kankakee River, seventy miles from Chicago, and is reached by the Chicago, New Albany and Louisville Railroad. The shooting on the club's grounds is first-class and is unequaled in this part of the country. The duck, goose, snipe, chicken, quail and ruffed grouse shooting is superb. I bagged seventy-two ducks and one goose there last November. The following are among the members of the Sportsman's Club: W. W. Foss, H. B. Foss, C. A. Orvis, F. H. Elmer, R. A. Turtle, John J. Flanders, Frank Barnard, Ed. S. Douglas, Harry Orvis, Jim Shean and Charles Reitz.—Tex-Bore.

Wolves Abundant.—Chippewa Falls. Wis.-Wolves Abundant.—Chippewa Falls, Wis.—If any of your readers are short of wolves it might be well for them to come up this way. An old woodsman who had just returned from the woods tells me the "varmints" are wonderfully plenty, and made music around his camp every night. He found more than one place where they had captured and eaten a deer. One of the men at a logging camp lately shot a deer and followed it less than a mile, but when the unimal fell he found only some of its larger bones. The wolves had got in abead of him. A case, perhaps, of retributive justice, for the deer was killed out of season, a thing which, I presume, occurs frequently in the vicinity of our logging camps.—Badder. camps.—Badger.

WENONAH, N. J., Feb. 7, 1882.—We have just had our first considerable snow storm of the season. Up to within a few days' many birds which usually leave us in the winter have remained here. To-day, and for several days past, the song thrush has been with us. I do not before remember seeing them till May. One covey of five or six qualis only is all that has been seen in this vicinity for more than a year past. It is hoped that the Legislature will pass a law prohibiting their destruction for at least three years.—M. P. P.

The Police "Take in" a Fox.—Dover, N. H., Jan. 29, 1882.—Last Thursday a novel fox chase took place near here, and wound up in nearly the centre of our city. In early morning Mr. Edward Barilett, of Great Falls, started two full-grown foxes on Goodwin's Hill, some two miles from here, and, after running two or three hours, the foxes made direct for our city and came down one of our main streets, passing a number of persons and teams, and took shelter in a stable belonging to Mr. John B. Hall, where one was captured by two police officers, the other escaping. The one captured was afterwards killed, and the owner of the dogs running was notified he could have the skin by applying at police station No. 1 of this city. The Dover Rod and Gun Club held its annual supper last week; and a most enjoyable affair it was, too.—W. A. G.

Charleston, Illinois, Feb. 9, 1882.—I believe winter has broken. On the 3d meadow larks were here and singing. On the 7th wild pigeons were flying in all directions; ducks and geese flying north.

INQUISITIVE VISITOR (to captain of life saving station, quitur): "I should think you might shoot lots of porpoises

loquium; "I should think you might shout fore of purposes here, Captain."

Captain (who does not hear quite well, and imagines that the remark referred to foxes): "Well, so we might, but then we haven't got any dogs here, and they squat in the grass so that it's mighty hard to see them."

Curtain falls to chorus of laughing surfmen.

CURE FOR GOUT.—We commend the following to our gouty readers: Senator Voorhees says: "I have cured myself of rheumatic gout by a simple remedy—taking lemon juice in warm water twice or three times per day. Consequently, I am able to do what I have not done for years—walk from my lodging to the Capitol and back, a matter of four miles every day, and outstrip the young fellows who go with me."

The Scientific American, formerly our near neighbor, is now issued from its new office, No. 261 Broadway, on the opposite side of the City Hall Park from our own office. The journal maintains its high position of ability and usefulness.

PUBLISHERS' DEPARTMENT.

E. G. Koenic is advertising a Flobert parlor rifle for \$5, also a full line of guns, pistols, fishing-tackle, etc. His address is 875 Broad street, Newark, N. J.

RUBBER Goods are always in demand for the field. The old firm of Hodgman & Co. was one of the first to make a specialty of sportsmen's rubber goods, and in this brauch of the trade cannot be surpassed by any manufacturers in the world.

LONG ISLAND FIRST in the word.

LONG ISLAND FIRST the Experiment of the menhaden fishery on the Long Island coast for the year 1881; Menhaden rendered, 151,000,000; gallons of oil manufactured, 650,000; tons of scrap, 13,616; tons of edible fish marketed, 770. The men who rake claims in the waters of East Hampton sent to market in the season 11,000 bushels of clams.

Sea and Biver Hishing.

"I was much more surprised when I learned that the first chemist of his time was a professed angler, and that he thinks that if he were obliged to renounce fishing or philosophy, that he should find the struggle of his choice pretty severe."—(so. TOKKON'S JOURNAL, Vol.

ANGLING.

TO A FELLOW CRAFTSMAN.

BESIDE the gentle stream,
In morning's earliest beam,
How sweet to stray—
To hear the blithe birds sing, As, gaily, on the wing They greet the day!

To see the flow rets peep, As from a blissful sleen At rosy morn:
And shake their slender stems
Free from the dewy gens
The night hath worn!

To breathe the bracing bree: Bearing from budding trees Perfumes most rare; To feel ourselves to be With all in sympathy,
And free from care!

What pleasure there to stand, With pliant rod in hand. Upon the brink—
And see the subtle hook
Within the rippling brook Slowly down-sink

The rod, the line the reel-O what a glorious feel When floats the fly Upon the water's whirl Where 'neath the eddying purl The trout doth lie

Or, when the graceful float Rides like a fairy boat Upon the tide-Until it warning gives,
And impulse quick receives
Beneath to 'bide!

Ah, then, my friend, to "strike," What joy to it is like When fish is fast? To see the glint and gleam Of trout, or perch, or bream, Their struggles past!

My friend and angler dear These joys, for many a year, We oft have proved; And may the future tend Our willing feet to wend To sport beloved!

SILKWORM GUT.

SILKWORM GUT.

RECENT article in our columns on the manufacture and strength of gut, from our correspendent, Samuel Allcock, of Redditch, England, was reprinted in the Fishing Gazette. A correspondent of that paper thus takes issue with Mr. Allcock and gives his own views as to the treatment of that delicate portion of the angler's tackle. He says:

It is a bold act for a man to differ with the dictum of a member of so eminent a firm as that of Messrs. Allcock & Co., of Redditch; but the detail of the treatment of silkworm gut, as given in the American Forest and Streem, in your issue of the 14th inst., as emanating from that gentleman, is in many respects so totally opposed to what I have been assured are the proper preparations for this product, that I dare not suffer the statement altogether to pass without challenge. Mr. Allcock says he has been in Murcia, Spain, superintending its manufacture, and has discovered two causes which make gut brittle, and has instructed the managers there to see all the native producers of gut and impress upon them the importance of keeping the gut out of the sun.

Are we to conclude that Mr. Allcock has only now, after "thirty-five years' experience," discovered that the sun has been the cause of the complaint at present so general respecting the inferiority of this product? I will grant, for the nonce, that the sun may be one of the causes of the present deterioration; but, if so, we have been in error from the first application of this most useful production, as the sun has not ceased to shine, nor has it diminished the power of its rays. Then how does this tally with the positive knowledge that at one time gut was of the best; no complaints were heard of its strength and endurance, and it is now charged with abuses directly opposite to those which contributed so greatly to the excellence of the material? We admit that the gut is worse now than heretofore, but we do not admit that the sun has anything to do with it. In case, however, this indictment against the grand luminar

are detrimental; but how does this agree with the following, if we are to take the process as that indersed by Mr. Alleock? The manufacture of gut is very simple. The gut from the worms is bought from the small country people who breed the worms in their houses. The first process in making is to put the gut in a furnace with water, a little soda and soap; after boiling a short time the outer skin comes off it. It is put in yellow and comes out white after it is put in the bleaching-oven.

For our own part we are inclined to believe, subject to correction, that the furnace, the boiling and the baking, the

put in yellow and comes out white after it is put in the bleaching-oven.

For our own part we are inclined to believe, subject to correction, that the furnace, the boiling and the baking, the bleaching, the soap and soda, have more to do with the recent deterioration of gut than the poor shandered sun and atmosphere, Mr. Allcock speaks of the moisture being taken out by the sun. I presume he means it solidifies the gun, the most vital portion of the gut that holds together the many threads of silk which form the strand. But, surely, soap and soda, boiling and bleaching, etc., is most likely to extract both moisture and gum than any of the old processes from which we got the best material.

We have in England tried the following receipt with silk-worms bred by ourselves. Steep silkworms, when just ready to spin, in strong vinegar for twelve hours in warm weather, or two or three in cold; then take them out, break them in the middle, stretch them out as far as possible on a board furnished with slits or pegs to hold them, and dry them in the sun. The worms may be known to be going to spin by refusing food and by having a fine silken thread hanging from their mouths.

The coll foilway that we have head have been when the arm.

mouths.

The only failures that we have had, have been when the sun has not been sufficiently hot; but even then by artificial heat we have produced average samples of gut. We should add that after it is dry we wipe it with olive or sweet oil and put it away in Russia or wash leather.

CHUB FISHING.

IN a late number of your journal, "P. A. B." asks: "Could some of your friends give some points concerning chub

IN a late number of your journal, "P. A. B." asks: "Could some of your friends give some points concerning chub fishing?"

If "P. A. B." is willing to accept my definition of the noun "chub," I think I can give him the desired information. In the South, the land of my nativity, we know the chub as a short, thick fish, with a mouth exceedingly large in proportion to body, dark on the back, shading to gray on the side, and white under the belly. This fish is found in all, or nearly all, the ponds and lakes in the Carolinas, Georgia, and, I believe, in all the other Southern States. They are frequently taken weighing from 4 to 12lbs. Anglers who make a specialty of chub-fishing use almost exclusively live bait—a small silvery-white fish, to be found wherever chubs abound—they are locally denominated "roaches."

Into the back of the roach the hook is inserted, usually under the dorsal in, the bottle-stopper (used as a float) is pulled up the line about \$H. 6in. from the hook, and the whole cast into the pond out among the lily-pod and watercresses. The roach swimming around attracts the attention of the chub. When a chub makes up his mind to dine on a roach he does not wait to say grace, but goes for that roach with a vim—the man at the end of the rod usually knows when this takes place, as the chub is a wicked biter, and, laving such an enormous mouth, swallows everything down at a gulp. The chub is by no means as game as the trout or black biass, but for a minute or two the novice thinks he has caught a whate, or at least an alligator.

While on a visit to Augusta, Ga, in April, 1880. I saw at Barriott & Land's drug store, on Broad street, four clubs, aggregating 36lbs. in weight. They were caught in the mill pond which supplies power for the cotton factory at Langley, S. C., situate on the S. C. R. R., about nine miles north of Augusta, and about midway between that city and Aiken, a winter resort for invalids from the North. These fish were intended for the banquet given in honor of a party of Cincinnati busine

Baltimore, Md. [It is unfortunate that our fishes' names are so mixed that it is necessary to know a man's locality to determine what fish he means by a certain name. "Ches. A. Peake" evidently refers to the black bass, which is perversely called "chub" in parts of the South. "P. A. B." meant the small brook fish with soft fins, the *Semotilius*, a fish called "dace" in some parts of the country, and which sometimes reaches a pound in weight. This is the only true "chub," and the one that "W. J. H." refers to below.]

In answer to the wish of a correspondent, "P. A. B.," in your last number, I will endeavor to say a few words about the club. To capture this fish, as an artist, use a rod about twelve feet long and very limber; between a light bass and a fly rod, with a plain wooden reel 4½ inches in diameter, a silk twist line about the calibre of sewing thread, a cork float long and thin, that will carry four or five shot the size of peas, the hook to hang twelve or fifteen inches lower than the last shot. The bait for early spring fishing is the residuum of tallow inclhers' vaus which you can get from any drysalters, but hard enough to fix the barb well in him. Keep your rod well up, and keep a strain of about a pound on your line. If you get over his first rush he is yours after a few plunges.

One thing is very essential which I have omitted, never, when fishing along way down stream, allow your line above the float to lag or rest on the water, and keep your line moderately taut, so that the shot does not travel before the bait. If you should not get a bite in a dozen swims try somewhere clse, for you may be sure there are none there.

W. J. H.

FISHING WITH CORMORANTS.—Professor Ward, in a letter to the Rochester Democrat and Chronicle, thus writes of the way in which the Chinese eatch fish with commorants: "As we ascend the river we pass many hundred fishing boats which are floating down with the tide, fishing as they go, and which will return with it in the same way this evening. A few of these are Chinese, and they are using here the strange plan of their own country of cormorant fishing. On a large bamboo running several yards out over the bow of their hoat, sit usually two cormorants like great black geese, only more sharply and with thinner bodies. They watch the water keenly as the boat floats along, and now one now the other of them rises quickly, gives a flopping sort of a

dive, disappears beneath the water and in a moment or two emerges with a fish in his beak. Before he has time even to eat this, "John," draws him in promptly by a fine, strong cord which he has before made fast to his leg, takes the fish away and sets him back on the bamboo, when he waddles along to the further end and takes station to repeat this thankless labor. When the day's work is over the master, regulas his faithful fishing communicate with the the master regales his faithful fishing companions with the offal."

"WHAT IS A TEN-POUNDER?"

WE publish the following extract from a private letter from

W E publish the following extract from a private letter from our valued correspondent, "S. C. C.," who has given us so much good information about Southern coast fishes. He wants to know what fish Captain Dampier called a "tenpounder," and at the same time gives us some interesting local names for the "crab cater," He writes:

The extracts from Captain Dampier's log-book which you gave in Forest And Stream, Jan. 26, interested me much. With the exception of size, his description of our tarpon is excellent; but I have never seen one on the East Florica coast as small as 25 pounds. Of that size they could be taken with rod and reel. Perhaps, like the sheepshead, the tarpon spawns in Southern waters, and going North in summer, grows larger on the way, by reason of plentiful food.

The fish which the Captain calls "snooks," I have taken at Indian River Inlet, East Florida, where it also goes by the name of sergeant-fish, on account of the stripe along the side, resembling that upon the trousers of a non-commissioned officer; also called cobia and crab-eater. Cavallies, mullets, barracouts, sting-rays we also know, but what is a tenpounder?

[We do not know the ten-pounder, at least not by that name.

partacouts, stug-rays we also know, but what is a terpounder?

S. C. C.

[We do not know the ten-pounder, at least not by that name. The fish called "snooks," "sargent," "cobia" and "crabeater," is the Elacate canadus, Linn., Gill., and the latter in his list of fishes of the east coast of North America gives only one common name, that of crabeater. It is the Elacate canada, of Holbrook: "Letthyology of South Carolina," p. 95. It is easily recognized by the descriptive stripe running from its eye to the tail, from which the name "sargent" comes. Gunther gives its range as: "Indian seas, Tropical parts of the Atlantic, Atlantic shores of the United States." Gill gives it as: "Cape Cod to West Indies." It does not appear in "Goode's Fishes of Bermuda."]

TENNESSEE FISH NOTES.

Tennessee fish notes.

To-morrow Squire Knight will entertain a select company from among the amateur anglers of Nashville, a his farm near the city. His object is principally to show them his two fish ponds, and to try to organize a company for the purpose of increasing his present facilities for cultivating game fishes on a large scale. From what I learn, the supply of clear, cold spring water is unlimited, superb sites for other ponds, and all within easy access of our market. It is to be desired that the enterprise will meet with encouragement, as it assures our citizens a fair supply of delicious and healthy food, and a place of resort to those of our townsmen who have not the time to make prolonged fishing excursions. Should the company be organized as proposed by the Squire, it will partake more of the character of a club, and he is specially desirous of procuring a large number of stocktakers in order to make the place one of attraction.

Pond-building and fishculture have become very popular in this State of late years. A goodly number of farmers have secured stocks of German earp, but many others are experimenting on our local game tish. If they neet with fair success, it will not be many years before Tennessee will be abundantly supplied with all the varieties of fish which will thrive here.

Since the floods in the Cumberland have subsided, quanti-

here.

Since the floods in the Cumberland have subsided, quantities of buffalo, cat and drum are being taken on trol lines, but amateur angling is at an end until spring. Several new clubs have been organized this winter, and the old reliables, the F. A. C. and Cumberland, have assumed new vigor and will do good work when they take again to the tented field.

SNAPPER FISHING IN FLORIDA.—A Jacksonville correspondent of the Savannah Ners says: "Mr. Hamilton Disston, President of the Florida Land Improvement Company, with a party of friends from Philadelphia, is now in the city. A day or two since a few of these gentlemen took the yacht Mischief and steered for the snapper banks. They were fortunate in finding the fishing grounds without difficulty and captured thirty-six of the beauties in an hour and a half, the aggregate weight amounting to seven hundred pounds. The sons of the City of Brotherly Love were bewildered with their success and astonished at the size and abundance of the inhabitants of our waters. The fish are caught at a depth of from sixteen to twenty fathoms, and when the lead shows a bottom of coral and shell cast anchor and you can be sure of a heavy bag." a heavy bag.

LARGE STRIPED BASS.—Philadelphia, Feb. 8,—Please give us a list of some of the heaviest striped bass on record, caught with rod and reel. Our veracity is doubted when we say fifty pounds. What is the difference between the rock bass caught in the Delaware and sold in our markets under that name, and the large striped bass caught elsewhere Y—Constant Reader.

STANT READER.

[We have published accounts of striped bass caught at Montauk this summer, some of which weighed seventy pounds. Mr. A. B. Dunlap took one of sixty-two pounds at Pasque Island some years ago; and Mr. Frank O. Herring took one two years ago, at the same place, which weighed sixty pounds. This fish is called "rock" and "rocklish," south and west of New York, but it is the same fish.]

BIG BLACK BASS.—This week Mr. Blackford received a black bass from Georgia, which weighed ten and a half pounds. It was sent to the Smithsonian Institution and will be preserved in the shape of a plaster cast. We did not see it, but no doubt it was of the big-mouth species.

BIG WESTERN TROUT.—The Socramento, Cal., Record-Union of Feb. 1, contains the following: "Last week R. T. Bennet, of Excelsior, caught in the Sausal, Sonoma county, a trout weighing thirteen pounds, and Al. Turner another weighing nine pounds."

FISH SPECIMENS WANTED .- Prof. Baird is anxious to procure specimens of fish called hagfish, sucker and slimefish (Myxine glutinosa), and any of our salt-water fishermen who may capture them will confer a favor by sending him a few.

Hishculture.

THE AMERICAN FISHCULTURAL ASSOCIATION

THE AMERICAN FISHCULTURAL ASSOCIATION A MEETING of the executive committee of the association A was held at the office of FORES AND STREAM on Tuesday the 14th inst., to determine the time and place of the next annual meeting, and such other matters as might come before it. The following were present: Mr. Barnet Phillips, Secretary; Mr. E. G. Blackford, Treasurer; Mr. Fred. Mather, Chairman of Executive Committee, and Mr. James Benkard and Mr. John E. Morgan. A card was received from Mr. James Annih, of the committee, stating that his choice of dates would be March 30 and 31. After some discussion it was decided to hold it on Monday and Tuesday, April 3 and 4. Mr. Phillips favored the old place in Fulton Market. Mr. Mather suggested the Cooper Institute, or some other place up town. Mr. Blackford thought that it should be held in Boston one year. It was too late to consider the latter proposition this year, and a motion by Mr. Phillips that it be held in the rooms of the Fish Mongers' Association, Fulton Market, was carried.

ons of the Fish alongers absorbed fried.

fr. Blackford then offered the following:

lesolved: That the chairman of the executive committee the subject of a future place of necting before the associon before the adjournment of the next annual meeting, and the also bring before the meeting the question of institutions.

that he also bring before the meeting the question of institution life memberships.

Mr. Phillips then reported that while in Washington he saw Prof. 6. Brown Goode and Dr. Tarleton H. Bean, and that both promised papers. In Philadelphia he met Prof. John A. Ryder, who has been following up the experiments of Dr. Brooks on the development of the oyster, and who promised a paper on the history and embryology of that mollusk. Mr. Benkard partly promised a paper to be written by Mr. Redmond on trout culture by the South Side Club, and Mr. Mather thought that he might write one on some subject now unsuggested. Adjourned.

REPORT OF MASSACHUSETTS COMMISSION.

Mather thought that he might write one on some subject now unsuggested. Adjourned.

REPORT OF MASSACHUSETTS COMMISSION.

THE Commissioners on Inland Fisheries of the State of Massachusetts have just issued their sixteenth annual report for the year ending Sep. 30, 1881, which is not as voluminous as some of their previous ones. It opens with an account of what has been done in the matter of fishways, and we learn that surveys and plans for ways over the dams on the Ipswich River were made and forwarded to its owners hast Aurenst. A petition for a way over the dam owned by John S. Brayton, Swansea, was reported unfavorably, because there had been no migratory fish in the river for years, and the selectmen of the town would not agree to re-stock the stream. Other petitions were also declined. Of the Holyoke fishway they say: "In order to protect what little interest Connecticut has left us in this river, several persons have been employed at different times to look after the Holyoke fishway." It seems that complaints were made that certain persons, among them a former superintendent, were taking fish from the fishway and selling them. Detectives found that one night fifteen hundred ampreys were so taken and sent to Connecticut. A report of the lish passing the fishway at Lawrence, from April 22 to Nov. 1, shows the following species: Suckers, alewives, lampreys, black bass, chubs, shad, salmon and eels. The number of salmon seen in the daily inspections was 72, by much the largest number yet recorded. These fish nearly all came in one school at the end of June, when 30 of the entire number were seen in two days, no autumn run being seen. Four shad were seen in the way at different times.

Massachusetts' share of spawn from the Bucksport, establishment was 220,000. Of this number 50,000 were received at the State hatching house, Winchester, from which 410,000 six were obtained, and deposited in the lead waters of the Nashua River. The balance, 170,000, were forwarded to Plymouth, N. H. This, will the portion due t

The sixty thousand eggs mentioned in my last report, obtained from the salmon takon at the hatching-house on the Pemigewasset River, were hatched with a loss of eight per cent.

In December, 1880, and January, 1881, I received 449,500 Atlantic salmon eggs from Bucksport, Mc. These were hatched with a loss of 7,533. During the month of May 30,000 young salmon were put into the Contoccook River at Hillsborough. The remainder of both lots, something over 29,000, were put into the Pemigewasset River, from one to three miles above Livermore Falls. This year twently-five salmon have been caught at the hatchery, varying in weight from eight to twenty-five opinions. The nets were set June 3; the first salmon was caught June 20; the last Sept. 26. Twelve were females, and from them we have secured a hundred and twenty-five thousan'l eggs, as follows: Oct. 18, from 2 fish, 42,000. Oct. 23, from 3 fish, 53,000; Oct. 30, from 4 fish, 48,000; total, 123,000. The past summer, like that of 1880, has been a very dry season, and the river has been low the greater part of the time, which in part accounts for my not taking more or less stopped at Manchester, N. H. After the urgent appeal in 1804, from New Hampshire, charging Massachusetts with depriving her of migratory fish by unpassable dams at Lawrence and Lowell, it was hardly to be expected that any obstacle would be allowed in that State to retard the work now being 20 successfully carried out. It appears that the owners at Manchester have been constructing new mills, and disposing of additional water power, which accounts for the passage of salmon.

There is an impression among some of the mill-owners, that the owners at Manchester have been constructing new mills, and disposing of additional water power, which accounts for the water being below the crest of the dam at a time when most now they are the superson of the fish which may have been constructing hew mills, and charges fish which may have been created by the erection of these forms of the passage of salmon.

They

NEW JERSEY'S MENHADEN FISHERIES.

NEW JERSEY'S MENHADEN FISHERIES.

IN the Senate an important communication was read from United States Senator Sewell in reference to the menhaden fishing on the Jersey coast. Both houses, it is expected, will take rigorous action to prevent a continuance of that kind of fishing. The letter of Senator Sewell reads as follows:

I have had for some time under consideration the mather of our fishing interest along the Jersey coast, and had about concluded to introduce a bill in Congress prohibiting the curther destruction of our fish product by parties from other States. In a recent conversation, however, with Professor Baird, of the Smithsonian Institute, who is the recognized authority upon the subject, I learned a fact of which I was previously not aware—namely, that in the treaty with England upon the fishery question, the citizens of this country are privileged to fish anywhere in Canadian waters. The treaty, being reciprocal, grants the same courtesy to the people of Canada to fish anywhere along our coasts. It is, therefore, impossible to enact a law of the character I intended. It would give the Canadians a monopoly of the fisheries along our coast and would likewise enable the parties engaged in the destruction and damage of our fishing interests by the capture of menhaden for oil and fertilizing purposes to take out Canadian registers.

The State of Mainc, through its Legislature, considered the

tion and damage of our Issuing innerests by the capacitation menhaden for oil and fertilizing purposes to take out Canadian registers.

The State of Maine, through its Lecislature, considered the same question for some time, and finally arrived at the conclusion to pass an act prolibiting the catching of fish along her shores with purse nets or other contrivances, and the result has been that, in driving away the different companies engaged in that business—principally from Connecticut and Rhode Island—and in freeing their coast from their operations, there has been an immense increase of this class of fishing along our shores within the past few years.

I would therefore recommend the State to take action similar to that of Maine, and not await the action of the national government, which cannot be successfully invoked in view of the treaty I have referred to. The evil is a crying one and must be suppressed by the best means at hand. The growing oppular interest in the shore line of our State and its magnificent summer resorts has really brought the question up as one of the principal industries in New Jersey, from which we receive a revenue equal, if not in excess, of that from our manufacturing interests. The protection of fish for the use and anusement of a population of 250,000 during the summer months and still increasing is of so much importance that it behooves the State to give it the consideration it deserves.

The letter was referred to a committee composed of the

The letter was referred to a committee composed of Senators from the seaboard counties.

TRENTON, N. J.

AUSTRALIAN FISHCULTURE.—The Zoological Society in New South Wales, who have successfully introduced trout and perch into that part of Australia, have renewed their efforts to introduce salmon, and have applied for and received from the United States Fish Commission two boxes containing 40,000 ova. These, after great care and trouble being taken with them, have been safely deposited in hatching boxes at Bowenfels.

FISHCULTURE IN NEW JERSEY.—At the hatchery FISHOULTURE IN NEW JERSEY.—At the natenery of Mrs. J. H. Slack, at Bloomsbury, N. J., there are now 50,000 eggs of the California salmon ready to distribute in the streams of the State. Prof. Baird has also forwarded to this hatchery 95,000 eggs of the Atlantic salmon, Salmo salar, for the Delaware river, and 15,000 eggs of the land-locked salmon for the lakes in the interior part of the State.

OYSTER LAW OF NEW JERSEY.—A bill has just passed the Legislature of New Jersey, by a vote of 12 to 7, which for-pids all non-residents from gathering, planting or being inter-ested in oysters planted in this State, under a penalty of fine or imprisonment, the former not to be less than \$1,000 and the latter not less than a year.

SCENT.

THAT the nose of the dog is a most wonderful organ no one at all conversant with the performances of hunting dogs will for a moment doubt. How marvelous the power that enables the pointer or setter to accurately follow the intricate windings of the trail that was traced by the wandering bird perhaps hours before. How wonderful his ability to follow the footsteps of his master, even through a crowd, upon the pavements where all seent, seemingly, must be obliterated by countless other footsteps. How perplexing the fact that he can unerringly follow the track of our horse, driven at speed over the cobble stones or dusty road, and surely find us, although many teams have crossed and recrossed our path. Often have we puzzled our brain in endeavoring to solve the mystery of this wonderful power, but in vain; and long ago, like Dundreary, we resolved that "this was a thing that no fellow could find out." We once saw a brace of dogs road the trail of a grouse athwart the effliwium from the carcass of a dead horse, which the wind blow directly in their nostrils, and the heavily laden air reminded us—by contrast—of the "spice-laden odors of Araby the blest," with never a doubt nor fault they followed the bird and came to a staunch point within twenty yards of the odorous mass. We could scarcely believe the evidence of our eyes nor place any confidence in the sense of the dogs until, with bated breath, we rushed in and flushed the bird. We then and there foreswore all future attempts to elucidate the unfathomable mystery surrounding the subject. scarcely believe the evidence of our eyes nor place any confidence in the sense of the dogs until, with bated breath, we rushed in and flushed the bird. We then and there foreshove all future attempts to elucidate the unfathomable mystery surrounding the subject. Besides the sense of smell there is still another sense that pertains to the nose of our four-flooted friend that appears to be well defined and in constant use. We refer to the habit which he has of touching with the end of his nose any object that he may he in doubt about. We have often noticed, especially when in a crowd, that when our dog lost us for a moment he would upon his returnationed assured by our voice and the evidence of his sight and smell—retain his inquisitive look, and would not appear to be perfectly satisfied of our identity until he had touched our hand or some part of our person with his nose. When he meets a companion, or discovers something that he does not quite understand, nothing but actual contact with his nose will satisfy his corrosity. We are well convinced that most dogs who have been hunted much on different kinds of game can readily distinguish the difference between them, and are never at fault as to the particular kind of bird before them. We have owned several dogs that would almost unerringly indicate by their action just what was in the wind, and we have many times changed our shells for something more appropriate to the occasion to the manifest improvement of the bag.

LAVERACK PEDIGRES.

IN our issue of Feb. 2, we published the letter of Mr, Llewellin and "Perplexity," together with the comments of "Justice," who appears to be more zealeus than correct, at least so far as the color of the get of Pride of the Border is concerned, for it is well known that several of them show the liver color, although this is by no means conclusive avidence that the color comes from a recent cross with the Edmond Castle strain.

The following letter from Mr, J. R. Robinson in relation to the matter explains itself and completely refutes the second charge of Mr. Llewellin, and so far as we can see, the other charges depend mainly upon this, thus leaving Mr. Llewellin a very precarious foothold to stand upon before the committee of the Kennel Club. Mr. Robinson writes:

"I beg to protest againt Mr. P. Llewellin drawing inferences from letters written by me when he puts a totally different construction on my remarks to what they really meant. I have never imagined for a moment that my late friend E. Laverack crossed his setters, as he told me not once, but repeatedly, just as Mr. Llewellin acknowledges he told him, that, although he crossed for experiment, he never found it succeed, and consequently he had never kept any of the results. What he did say about Pride of the Border was this: 'He has thrown back in color to the Edmond Castle breed,' which has lain dormant in his sort for thirty years. If will swear, or take any affidavit the committee of the Kennel Club may require, that Mr. Laverack stated thirty years, If will swear, or take any affidavit the committee of the Kennel Club may require, that Mr. Laverack stated thirty years, which letters in my possessions will prove. Some may be surprised at such an occurrence; but such results are well known among breeders of various stock, as well as to medical men. As an instance, in foxhound kennels, within recent years a black and tan, of the regular markings of the old talbot, has a bias tand per men well and the proper strains of the would at

Mr. Herzberg also has a word to say upon the subject, and nakes one or two points which are well taken. His letter is

as follows:

Editor Forest and Stream:
A little knowledge of dogs, particularly where that little knowledge is supplemented by boundless prejudice, is certainly a most dangerous thing to the man who uses that knowledge for the editication of men with no ambition to have a breed of setters called after them.

This thought is brought out by the recent so-called protest of Mr. R. L. Purcell Llewellin, which recently appeared in the English sporting papers and which was extensively copied in this country.

English sporting papers and which was extensively copied in this country.

Before showing how limited is Mr. Llewellin's knowledge of the subject he assumes to enlighten the world about, permit me to thank him for having come out over his own signature, even though that signature indorses glaring errors and publishes to the world the ingratitude of its owner to a dead friend.

Last year Mr. Buckle, Mr. Llewellin's kennelman, under the nom de plume of "Breeder" undertook to edify us as to the merits of his master's dogs and the defects of all others; his efforts at English grammar and stud book lore showed he was quite as well posted as his employer, who we must now believe inspired him. But though Mr. Llewellin is quite as competent and fully as bitter as his servant, it is a pleasure to have a principal to deal with and to know that the man's ambition to have his name attach to a breed of dogs shows totally to the world just what kind of a man he is.

To answer fully the misstatements of Mr. Llewellin would take more space than I could ask for in one issue of your excellent journal.

To answer fully the misstatements of Mr. Llewellin would take more space than I could ask for in one issue of your excellent journal.

The one great point made by the protestor is in the closing paragraph of his remarkable document, and reads as follows: "To a witness I am prepared to call to whom Mr. Laverack stated that Pride of the Border's color (liver and white), till then unknown in the breed, actually was due to his crossing with the Edmond Castle Breed." Mr. Buckle did not revise this sentence of his master, or we are sure it would be structurally more smooth if equally more ungrammatical, but it is not our purpose to teach Mr. Llewellin to write decent English but to get him to tell the truth or to acknowledge that his misstatements are the result of ignorance, not prejudice. I might say here that Mr. Laverack—whom Mr. Llewellin, now that the former cannot answer back from the grave, attempts to suirch—certainly knew more about dogs than about mea, else he would never have dedicated his excellent work "The Setter" to such a "friend" as Mr. Llewellin has proven himself to be demortius mil nisi bonum.

But the "liver and white" is the point at issue. In the "Konnel Club Calendar and Stud Book," vol. 11, under number 200, the following entry appears:

But the "liver and white" is the point at issue. In the "Kennel Club Calendar and Stud Book," vol. II, under number 4200, the following entry appears:
"Carlowitz—R. Ll. Purcell Llewellin's, Willesby Hall, Ashby de la Louch, breeder, owner, whelped 1873. Pedigree: by Pilkington's Dasa (No. 1342, vol. L) out of Llewellin's Countess (No. 1485, vol. L) Chief performance, Bedford, first prize."
When all the other entries have the colors given, why did not Mr. Llewellin give the colors in this case?
The presumption is that he had something to concead, and this bit of subterfuge becomes painfully evident when it is known that Carlowitz is a liver and white dog, as Mr. James H. Goodsell, of New York city, the present owner, will gladly show to his visitors. Cau Mr. Llewellin tell us how it is that the sire of Carlowitz, Filkington's Dash, and his (Llewellin's) Countess, both blue beltons, descended from lir. Laverack's Old Bine Dash and tho! III., could produce a liver and white dog? Does he mean to tell us that all his own Laverack dogs have had an outcross to account for the color? That is the only inference that can be drawn from his wild stutement, and it will yet return to plague the originator, for he has in his recklessness fouled his own nest.

If this color is the result of an outcross then Mr. Llewellin must have known it since 1873, but during all these years he has kept silence as to the defect—if such is to be—tin his own dogs.

We must believe that Mr. Llewellin knew or did not know

has kept suence as to the detect—I such is to be—in his own dogs.

We must believe that Mr. Llewellin knew or did not know of the outeross that produced the liver and white Carlowitz; if he knew then he has willfully deceived the public. If he did not know, where then did he get the recent information that leads him and his unknown witness to find an outeross in the case of Pride of the Border! But a man who traduces the cade would not hesitate for his own petty ends to misrepresent his own stock, and if he has not done so, it is in order for him to explain.

BROGLYN, Feb. 8, 1882.

THE SIMCOE DOG AND POULTRY SHOW.

[FROM OUR OWN CORRESPONDENT.]

[PROM OUR OWN CORRESPONDENT.]

THE Norfolk Poultry and Dog Association held their first combination show at Simcoc, in the Drill shed, on February 6, 7 and 8. As we were particularly interested in the dog show we will pass over the poulty, of which there was a very fine collection for a local exhibition. The president, Mr. Freeman, and the secretary, Mr. A. W. Smith, did everything in their power to make the show a success, and were ably backed up by a good working committee, and have every reason to be gratified that their exertions were appreciated by the public and that their show was a decided success, both as an exhibition and financially. Since is one of the oldest towns in the Western Peninsula, but until a very few years ago it was without railway communication, but now it has two, and a third in contemplation. We may expect to hear of its being one of the most prosperous, as it is situated in the very midst of a magnificent farming country.

The Drill shed, which is situated in about the centre of the town and is admirably adapted for such an exhibition, being very large, well lighted and ventilated; and the floor being of dry sand there was no dampness about it. The dogs were konneled along the western side, and the eastern side was devoted to poultry.

The dors were not benched but nlaced on the cround. with

dry sand there was no dampness about it. The dogs were kenneled along the western side, and the eastern side was devoted to poultry.

The dogs were not benched but placed on the ground, with high divisions between each, which was a mistake, as it is not easy to see them when so low; and besides it is not good for them to lie on the ground at this season of the year. With this exception, and that sufficient care was not taken in having the classes placed in their catalogued order, everything was in very good shape.

The judging was done in a large open space in the middle of the building, and Dr. I. G. Niven, London, Ont., officiated as judge for all the classes and did quite as well as he usually does.

the building, and Dr. I. G. Niven, London, Ont., officiated spidge for all the classes and did quite as well as he usually does.

The first class, English setters, had a good entry of eleven. Of these the bitch Liddersdale was rightly placed first. She is a black, white and tan, and is very taking in appearance, and was well shown. Blythe, placed second, is rather large, but he best of the lot. Jefferson Davis we fancied for second place, but age and being quite lame put him back, and he had to be contented with h. c. Irish setter had no entries. Gordon setters had one good one in Jack. (Grouse-Moll III.) This is a fine Gordon and shows hinself remarkably well, and does credit to his sire. Water spaniels and cocker spaniels were not good, and the first prize was withheld in each case. In this class we saw Dr. Niven's beautiful little black cocker spaniels who was placed on exhibition and attracted an admiring crowd; she was shown in good condition. Foxhounds and beagles had some good extries, particularly Dan. O'Shea's Roxey, Forester and Music, and Col. Mabie's Count and Jeff. Collies had five entries and all very good. The Doctor took a very long time to decide between Laddie and Lassie for first place, but finally the dog got the blue card; and here we may say that in this class where dogs and bitches were shown together it s. hard to give a sound judgment, as the dog has the advantage always of a better coat and frill than a bitch, and that is particularly where Laddie was supportor to Lassie, who is a very stout bitch and was shown in beautiful condition, as were all Mr. Rothera's entries. Mr. Rothera had lost two very fine puppies, Collins taking the special for hest Collie pup exhibited. Fox-terriers were a poor Inixture. In St. Bernards Friam was justly placed first. He is one of the best proportioned dogs of the breed we have seen, and is very large, in fact, we considered him the best dog in the show, His condition was something worthy of comment. The following are

THE AWARDS.

English setters.—1. T. G. Davey's Liddersdale; 2. G. W. Well's Blythe; h. c., Blythe Woolnough's Tray; h. c., C. C. Rapeljo's Tory. Gordon setters.—1. J. Lorne Campbell's Jack; 2. Same owner's

Gordon setters.—J. J. Lorne Compensation (Gypsy. Water spaniejs.—I. David Durward's Sport. Cocher spaniels.—I. D. T. Rogero's Bronto. Forthsunds.—I. Dan O'Shea's Roxey; 2. Same owner's Forester. Greyhounds.—I. Dr. Stanton's Bepty. J. Madigin's Fan; C. R. Hox, Gerilors.—I. John Matthew's Gip; 2. J. Madigin's Fan; C. R. Black and tan terriors.—2. D. Durward's Con; h. c., T. J. Doah's Chris. Black and tan terriers.—2. D. Du wans of Song in Grip.

Merriers.—1. G. Bruce Jackson's Victory; 2. Dr. Stanton's Ruby.
Scotch terriers.—1. Dan O'Shea's Lady; 2. Same owner's Billy.
Collies.—1. N. Glazebrook's Laddie; 2. F. W. Rothera's Blassie.
St. Bernard.—F. W. Rothera's Pfraim; 2. A. McKelchaols's Major.
Newfoundlands.—1. F. W. Sinden's Nero.
Beagles.—1. Dan O'Shea's Music; 2. Col. Mabie's Count; h. c., same
owner's Jeff.

Lull does.—1. John Madigen's Crib.

owner's Joff.
Bull dogs.—1 John Madigen's Crib.
Bull dogs.—1 John Madigen's Crib.
Miscellaneous.—1. F. W. Rothera's Poutiff; 2. Dan O'Shea's Tom boy.
Beclal prizes.—Best setter, divided by J. L. Campbell's Jack and T.
G. Davey's Lidderstale. Best collie puppy, F. W. Rotherson's Colin.
Best spaniel, D. T. Roger's exhibit. Best miscellaneous, F. W.
Rothera's Poutiff.

NEW YORK BENCH SHOW.

NEW YORK BENCH SHOW.

We publish below a list of the classes for the Westminster Kennel Club's Bench Show, to be held April 18, 19, 20 and 21:

PREMIUM LIST.

There are 105 classes, as follows:

1. Champion mastiffs, dogs. 2, Same, bitches. 3. Mastiffs, dogs. 4. Same, bitches, 5. Pupples, either sex. 6. Champion 1, 192-194, dogs. 4. Same, bitches. 19. Champion 5. Same, bitches. 9. Same, bitches. 19. Champion Simooth-coated St. Bernards, dogs. 1, Same, bitches. 12. Smooth-coated St. Bernards, dogs. 1, Same, bitches. 12. Smooth-coated St. Bernards, dogs. 1, Same, bitches. 12. Smooth-coated St. Bernards, dogs. 14. St. Bernard pupples, either sex.

ax. 15. Berghunds, dogs. 16. Same, bitches. 17. Newfoundlands, dogs. 18. Same, bitches. 19. Same, puppies,

either sex. 21. Greyhounds, dogs, 22.

20. Diethers.

33. Deerhounds, either sex.

24. Champion pointer dogs, over 55lbs. 25. Champion bitches, over 50lbs. 26. Pointers, dogs over 53lbs. 27. Bitches, over 50lbs. 28. Champion pointers, dogs under 55lbs. 29. Bitches, under 50lbs. 30. Pointers, dogs under 55lbs. 31. Bitches under 50lbs. 32. Pupples, dogs, 33; pupples, dogs, 33; pupples, dogs, 33; pupples, dogs, 33; pupples, dogs, 34; pupples, 34; pupples, dogs, 34; pupples, 34; puppl

dogs under 55lbs. 31. Bitches under 2010s. De Appellon pies, bitches.

THE YELLOW DOG AHEAD.

THE YELLOW DOG AHEAD.

In reviewing the many happy days spent with dog and gun the by-past season in the field, none afforded me more real amusement than a day spent in pursuit of ruffed grouse and quall in the company of an old friend, with whom I have shot a few days each season for many successive years. In obedience to his kind invitation, a tedious drive brought me to his house near noon late in December, accompanied by a brace of my best setters. Hospitality is a rule of his house, and after partaking of a substantial hinch we were ready for the field. In answer to his inquiry whether he had better take his pup along, I replied that if he was sure of its good behavior I had no objections. On being assured he was all right he was unchained from his kennel, and looked a weed little fellow, lemon and white in color, about a year old, a cross between the Irish and English stetler, and had not quite the appearance of a bench show winner in for had not object to back in the puppy being off to onside had not man brace of ruffed grouss flussed and were brought to bear. The other bitch and the puppy being off to onside had not me to show himself, but in getting into the large field beyond the cover he was cast off and given his head. How deceptive appearances arc; for never in all me expectence with patter and setter was is so much astonished a setter in a saw that worthless looking creature at one transfersed and have the heavy bound, with haunches of stern whipping his hocks at every bound, with haunches of stern whipping his hocks at every bound, with haunches of stern whipping his hocks at every bound, with haunches of some to half the worth and the puppy length of the stern whipping his hocks at every bound, with haunches of some to happed the south of the most likely place to game to half the with its performance that I remained back and allowed his owner to go up alone to his pattern whipping his hocks at every bound, with haunches of many half and had beautfully point (in real sector style) a large covey o

OUR LONDON LETTER.

OUR LONDON LETTER.

IT is a rare thing for us to have such an open winter as the present one has, so far, been. Coursing has gone on uninterruptedly, and the work of the trainer has not for a day been interiered with. Horses, too, over most coursing grounds, have been running strong, and if the weather holds out as it is some rattling trials are looked forward to over the Altear flats when the blue ribbon of the leash is contested for next month. At present an Irish nomination heads the betting. Alec Halliday is so much favored that his owner, Mr. Alexander's nomination, is quoted at 1,000 to 30—and steadily backed at that. The Waterloo Cup is, however, a very open affair this year, and it will want a dog with plenty of bottom, as well as speed, and a good killer, to win, for Flatman, Earl Sefton's keeper, has never had a finer lot of strong running hares.

Mr. Swinburne will sell off his kennel of greyhounds at Lucas', Liverpool, during the Waterloo Cup week, a good chance for any one forming a kennel.

Mr. Swinburne will sell off his kennel of greyhounds at Lucas', Liverpool, during the Waterloo Cup week, a good chance for any one forming a kennel.

As a proof of the number of dog shows in this country and their popularity I may mention that the Kennel Chronicle has registered the winners at no less than 320 shows held during the two years 1880 and 1881.

The great difference in the standard for judging dachshunds between that just set up by our newly formed English Dachshund Club and that of the German Dachshund Club has brought forth a protest from the president of the latter in form of a letter, which, with copies of the two standards I inclose for publication, should you think the matter of sufficient importance.

close for publication, should you think the matter of sufficient importance.

The Kennel Gazette states that £190 was offered and refused for Mrs. Lindsay's pug dog Tum Tum II., and that the sum of £250 was offered and refused for Miss Jaquet's Tum Tum, and that in both cases the would-be purchasers were Americans, I should be sorry to hurt the feelings of these pug buyers or friends, but I find it mighty hard to be silent; still, perhaps the statement of the fact, showing its naked folly and extravagance is enough.

the statement of the fact, showing its naked folly and extravagance, is enough.

Tum Tum was a charming little dog and came to a sad end, being run over by a heavy wagon and killed. Tum Tum II. is also a good pig, and bids fair to take old Scotey's place as champion of the champions.

The entries for the eighth Field Trial Derby numbers sixty pointers and seventy-five setters, and it has been arranged for trials to take place in the last week of April over the grounds of Mr. H. R. Parqubarson, Tarront Gunville, Blandford, Dorsett, when the property of the state of the property of the property of the state of the property
et. London, England, Jan. 20.

MANGE CURE.—CHATTANOGGA, TENN.—Editor Forest and Stream: I notice that you are frequently asked for a mange remedy. Last summer and fall, my pointer had a very stuborn case, which resisted sulphur and lard and other similar ointments, which I had used successfully in former cases, and as an experiment I used a dilution of carbolic acid (one part of acid and eight parts of water), with which I thoroughly bathed the affected parts twice a day (having water at hand with which to wash it off, did it burn too severely), and in a few days the sores were healed. Have used it with marked success on hounds since.—Jay CEE.

PITTSBURGH DOG SHOW.—PITTSBURGH, PA., Feb. 6, 1882.—I am glad to inform you that the managers have secured the old City Hall for their show, a capital good place, well ventilated and plenty of light, and as it will only be devoted to the use of the dogs, all exhibitors can rest assured that their dogs will receive plenty of room and good care. The entries positively close on the 25th inst.—Chas. Lincoln, Supt.

EASTERN FIELD TRIALS CLUB.

EASTERN FIELD TRIALS CLUB.

A T a meeting of the Board of Governors of the Eastern Field Trials Club, on Thursday, Feb. 9, Vice-President Mr. Jas. H. Goodsell in the chair, the report of the committee pronouncing the treasurer's accounts correct was accepted. The committee appointed for the purpose reported as follows:

"The committee appointed for the purpose reported as follows:

"The committee appointed for the purpose reported as follows:

"The committee appointed for the purpose reported as follows:

"The committee appointed for the purpose reported as follows:

"The committee appointed for the purpose reported as follows:

"The committee appointed for annual field trials properly conducted, and under proper suspices, it is absolutely necessary that the question of ways and means should be disposed of permunently, by the adoption of a policy which shall provide for the collection every year in advance, of a sum sufficient to guarantee all the expenses which it may be necessary to incur, for leasing suitable grounds and stocking the same, for prizes, and in general for carrying out the purposes of the club, upon a broad and liberal basis, and in such a manner that a membership in the club may be endowed with privilezes which any gentleman may be proud to possess.

"We would therefore recommend that a special committee of three be appointed by the chairman of this meeting with instructions to report as soon as practicable, the best plan for securing the permanent establishment of the club upon an improved and more effective foundation, whether the same shall be secured by increased membership fees or otherwise, and that the report of the said committee be considered at a special meeting of the club, to be held immediately upon the expiration of the sixty days from and atter Jan. 12, during which time delinquent members are allowed to discharge their arrears of dues."

The report was unanimously adopted, and Messrs. Costar, Hall and Hamilton were appointed such committee, Messrs. boner, Godefroy and Leach wer

DOGS AND SHEEP.—The following letter has been sent to the chairman of the committee on agriculture by the president of the Massachusetts Society for the Prevention of Cruelty to Animals; "Boston, Feb. 4, 1882. Dear Sir: I nm not thied that legislation is sought for the increased protection of sheep, which I am informed means more severe laws against dogs. I would most respectfully ask in behalf of the Massachusetts Society for the Prevention of Cruelty to Animals, the privilege of addressing your committee on that subject. I shall hope to satisfy your committee, first, that shepherd dogs move employed in Europe, Asia and Africa and many parts of our own country, are the best protection for sheep; second, that bells attached to several sheep of each flock have been found, in England and elsewhere, ample protection; third, that in sheep raising and other districts dogs of inost species are exceedingly valuable in protecting poultry from various other animals; and, fourth, that dogs of nearly all species render great service to the people of this commonwealth, in ways too numerous to be specified in this letter. Very respectfully, George T. Angell, President of the Massachusetts Society for the Prevention of Cruelty to Animals."

for the Prevention of Cruelty to Animals."

"RAILWAY JACK," the dog which has become famous as a "free-pass" traveler on some of the English railways, has come to grief. The London Sporting Life of late date says: "Hitherto Jack has wandered all over England—has been seen at Glasgow, Dundee, Bristol, and London, also Paris, etc., without getting a scratch, always returning to his home at Lewes Station. 'Jack' was last seen at Lewes about a fortnight since, being then decked with ribbons, having been a welcome guest at a wedding party at Berwick. At Norwood Junction on Thursday night last he was crossing the metals, missed his footing when attempting to jump on to the platform, fell, and a passing train completely crushed his near fore foot, also fracturing the arm-bone. He was sent to the veterinary infirmary of Mr. R. Stock, Lewes, who, to save the animal's life, determined on amputation, which he subsequently performed, taking the leg off near the elbow, Mr. J. G. Braden, surgeon, keeping 'Jack' under the influence of chloroform during the operation. Numerous indeed have been, and still are, the inquries as to 'Jack's progress. We are pleased to state that he is doing as well as possible, receiving the most unremitting attention from his surgeons."

THE PELON DOG.—The Mexicans call him pelon, the Americans refer to him as the no-hair dog, while the stranger from the North who sees him for the first time calls him a castinon dog, for that is what he looks like at first glance; Although not particularly intelligent, the no-hair dog is susceptible of a high polish, for his hairless hide shines in the sun as if it had been recently touched up with stove polish. His body is about the size and somewhat of the shape of a water-melon—that is one of those small watermelons that are about the size of a pelon dog. He differs, however, from the melon in that his tail is adorned with a tuff of blond hair, which is never the case with the watermelon. He wears a tuft of hair—another tuft, of course, not the same one at all—on his head, which gives him a very striking appearance. The pelon dog is found in Austin, in San Antonio and in tamales, the latter being a Mexican dish, the ingredients of which are as uncertain as those of hash.—Texas Siftings.

ANOTHER SKEWER.—A letter from Indianapolis, Ind., signed by "S. H. M." in edition Feb. 2, has attracted my attention as being very similar to the case of a bitch which some years ago I presented to Mr. Henry McNeil, of Philadelphia. I called on Mr. McNeil some months after and found she had grown to be a beautiful animal. On examining her I discovered directly below the last or next to the last short rib on her left side a swelling, which appeared to give her some pain on pressure. Manipulation, accompanied by an apparent pain, made it known to me that the now discharging sore contained something of a solid nature, which I at first took to be a piece of fractured rib; when withdrawn it proved to be a butcher's wooden skewer used for trussing meat. I didn't measure it, but should say it was eight inches in length. No bad results followed, and the wound soon healed.—C. S. W.

CANINE NAMES.—A few days ago a local item told of a Third Ward boy who named his dog Peruvian, in the hope that its bark would be good for the ague, which brings to mind the fellow in Detroit, who calls his dog Non Sequitur, because it does not follow. This is altogether too classical for the Fourth Ward boy, who has dubbed his bull-pup the "World," because it wags as it will. A friend of the smart youth, on hearing it, remarked that that was far-fetched, for while the world might way on, who ever heard of any other part but the tail of the dog wagging. "What!" replied the precoclous Californian, "didn't yer never hear of a dog wagon?" The man came up invacidately and brought the item in.—Sacramento Record-Union. And a New York young lady will name her dog Misery because he loves company.

TRAINING vs. BREAKING.—There has been such a demand for the numbers of FOREST AND STREAM containing these articles that the supply is nearly exhaustacl and we can furnish no more. The treatise will soon be issued in book form, of which due notice will be given.

MR. WALN'S FOXHOUNDS.—I am sorry to write you of the death of the entire pack of Mr. Ed. Waln's imported foxhounds by distemper. The disease in its most malignant form attacked the dogs, and one by one they succumbed to it, the last hound having been destroyed only a few days ago. Accepting the opinion of Mr. Schrieber, of Philadelaphia, to whom the animals were shown the day of their landing, they were in a most miscrable condition, having suffered greatly during their long voyage to this country. Much was expected by cross-country riders from this pack of nineteen in number, and the Germantown Hare and Hound Club promised themselves many good hunts with them. The writer has heard not a few sportsmen give it as their opinion that English foxhounds imported to this country would not prove as good as our own dogs in following the fox in our wooded sections, and the greater part of the United States where red foxes are numted is much more wooded than Great Britain. "English dogs would prove too fleet; they start and could not be ridden after." Again, "Our dogs, owing to the fact that they are seldom seen in a chase, have naturally more tongue and are solden seen in a chase, have naturally more tongue and are spoken of as having less voice. The second generation of English stock, no matter how well the importation worked at home, would be infinitely superior to the new-comers." Mr. Waln has the sympathy of all true lovers of fox-hunting, for his importation would doubtless have been a great benefit to breeders and sportsmen.—Home.

COCKER SPANIEL CLUB.—Editor Forest and Stream; 1 have the pleasure to announce that Mr. J. H. Goodsell has given us a donation of \$10 to add to the cocker club prize list for the New York show. The club prizes now amount to \$25, which will be distributed as follows; \$10 to the best cocker dog; \$10 to the best cocker bitch; \$5 to the best puppy, and Mr. Goodsell's \$10 will be awarded to the best of the three winners. These prizes are open to the Cocker Club members only, and gentlemen desirous of competing for them should join at one. The amnual dues are \$2, and this sum will entitle members to compete for the special of \$10 at Pittsburgh in addition to the above.—Jas. W. Watson, Sec'y.

453 W. 43d st., New York.

BLACK SPANIEL LOST.—Mr. Chas. Dey, of Elmira. N. Y., has lost his black spaniel dog. He disappeared last August, he weighs about 32lbs.; his coat is long and slightly wavy, ears long and well feathered; legs also feathered. He is a compact and strongly-built dog. Information that will lead to his recovery will be suitably rewarded.

LORD PERCY.—Mr. Percy C. Ohl, of Plainfield, N. J., has had the misfortune to lose by death his celebrated black and tan setter dog, Lord Percy, from pneumonia. Mr. Ohl recently refused 81,200 for him. He was a grandson of Sir Edward Laverack's Mystery, also of the Duke of Gordon's Die.

PITTSBURGH DOG SHOW.—Mr. Geo. C. Storling, of this city, offers as a special prize at the Pittsburgh Show a lemonade set of thirteen pieces, suitably engraved, for the best Llewellin sewer dog puppy under twelve months old.

A prize of \$30 will be given best kennel of five St. Bernards; pair game medallions to best hish setter, bench and field trial record to be considered.

KENNEL NOTES.

KENNEL NOTES.

NAMES CLAIMED.

Wash and Net II. By Judge J. M. Kinney, Staunton, Va., for liver and white pointers—dog and blich—whelped Sept. 6, 1881, by Don Royal (Sulper-Royal Countes) out of owner's Tabby (——Nyt).

Brief and Branchle. By W. H. and F. Ashburner, Philadelphia, for Brief and Branchle. By W. H. and F. Ashburner, Philadelphia, for Brief and Branchle. By W. H. and F. Ashburner, Philadelphia, for white, black and tan beagle blich, whelped Aug. 21, 1881, by Flute (Rattler—True) out of Quees (Victor—Lucy).

Rose Blanch. By Mr Justin Van, Newark, N. J., for black cocker spaniel blich puppy, three months old, by Reap out of Wick's Blanch. Doctor Cyde. By Mr. N. Palimer, Baltimore, Md., for liver and white pointer dog, whelped June 20, 1880 (native North Carolina stock).

white pointer dog, whelped June 20, 1880 (native North Carolina stock).

Polly Wog. By Mr. W. H. Colcord, St. Joseph, Mo., for dark liver Irish water spaniel bitch, whelped Nov. I. 1881, by imported Dan O'Conner out of imported Irish Nell.

Smart. By Mr. J. Byson Marston, North Andover, Mass., for Gordon setter dog, whelped Aug. 10, 1881, by imported Rowland out of Gypsey (Tom—Bess).

BRED.

Mollie B.—Snipe. Mr. H. C. Bronsdon's (Boston, Mass.) imported red Irish setter bitch Mollie B. to owner's Snipe, Feb. 9.

Bette—Snipe. Mr. James S. Wiberts (Manch Chunk, Pa., liver and white cocker spanie) hitch Belle to Mr. Johnson's liver cocker Snipe, Feb. 10.

Feb. 10.

Carlie. Mr. Manassab Sniph.

Feb. 10.

Jill—Curlie. Mr. Manasseh Smith's (Woodford, Me.) liver English curly retriever Jill to owner's curly retriever Curlie. Feb. 13.

Flirt J.J. Panater. Mr. Thomas J. Goodwin's (Portsmouth, N. H.) hengle bitch Flirt H. (Flirt—Juber) to owner's Ranter (Rally—Louise),

J. Brey—Ranter. Mr. Thomas J. Goodwin's (Portsmouth, N. H.) de bitch Gipsey (Major—Vesta) to owner's Ranter (Rally—Louise),

Feb. 5.

Loo—Lock. Mr. J. S. Crane's (Lake Village, N. H.) Gordon setter bitch Loo (Drake—Bess) to Mr. J. F. Johns' (Haverhill, Mass.) Lock (Bailey's Tom—Pansy).

Nellte Grey—Prince of Orange. Mr. John Davidson's English setter bitch Nelle Grey (Afton—Nellie) to his imported Prince of Orange, Feb. 3.

Feb. 6. Hourish—Elcho. Mr. Edward O. Ladd's (Everett, Mass.) red Irish setter bitch Flourish (Berkley—Ruby) to Dr. Wm. Jarvis' champion Elcho, Feb. 7. Queen Bess—Grouse. Mr. Thompson's (Foxboro, Mass.) setter bitch Queen Bess—Grouse, Feb. 7. Rhue—Arlington. Mr. Thomas Adoock's (Providence, R. I.) red Irish setter bitch Rhue (Elcho—Alcock's Juno) to Mr. C. Fred. Crawford's (Pawtucket, R. I.) Arlington (Pratt's Dan—Hobart's Ruby), Feb. 8.

SALES.

Roger. English setter dog (Rob Iny—Belle) by Mr. Anthony Higgins, Wilmington, Del., to Mr. J. Clarence White, Philadelphia, Pa. Rouelmd-Gipsey whelp. Gordon setter dog, whelped Aug. 10, 1881, by Mr. S. B. Bray's imported Rowland out of owner's Gipsey (Tom—Bess) by Mr. G. W. Edwards, North Andover, Mass., to Dr. I. B. Bolton, Newburyport, Mass. Doctor Cloyde. Liver and white pointer dog, whelped June 2, 1880, by Mr. William Asken, Kinston, N. C., to Mr. N. Palmer, Baltimore, Macketser, Black spaniel dog puppy (Benedict—Rhea Il.) by the Hornell Spaniel Club, Horucilsville, N. Y., to Mr. Burr Hollis of the same place.

THE GREAT BILLIARD MATCH AT PARIS.—The result of the great international match at Paris between Maurice Vignaux, champion of France, and George P. Slosson, champion of America, is very gratifying to the numerous patrons of the noble game in this country. Slosson, as every one knows who takes an interest in this gentlemanly species of recreation, is a young American who has several times essayed to wrest the title of champion of the world from Vignaux, who has worm it so long, but, until this last memorable contest, was always defeated. In the recent game, however, which proved to be the greatest on record as regards high averages and runs, his victory was complete. The match was 1,000 points, three ball carrons, for a stake of 10,000 rs, under what is called the champion rules. It was played, as all provious great matches of recent date, in France, on a Collender 5x10 standard table of the world. The runs and averages were higher than those attained in any game ever before played, and attest the great superiority of the Collender tables.

Vachting and Canoeing.

THE KEY TO FAIR MEASUREMENT.

Chapter the First.

- 1. Yacht designing implies the fashioning of mass.
- The resulting form is model.
 The pass dealt with limits the qualities of every kind attainable a the model.
- 4. The mass employed supplies the possibilities for the embodiment of qualities in the model.
- Equal masses afford equal opportunities for the attainment of
- qualities.

 6. Unequal masses do not.

 7. Hence logical conclusions as to the value of form can only be drawn from comparative tests of the same mass put into different shapes. Or from different masses reduced to equality in respect to mass by a proper allowance from the larger to the smaller.
- 8. A given mass is entirely without specified form.
 9. Taxing mass is therefore not taking the particular shape which it as assumed in a certain model, but the amount contained in the profession of the columns of the columns.
- model and that only.

 10. Equal facilities in mass granted for the production qualities, it is manifestly inequable to assess differences in the forms chosen. No just cause for an assessment exists
- cause for an assessment exists.

 11. To tax such differences, as for example, differences in length, in beam, in depth, in any two or in any three of them, or in any features whatsoever of the model, is an exhibition of prejudice against certain peculiarities of form.
- 12. No fair rule of measurement should exhibit prejudice against or
- favor for any form at all.

 13. Rules having bulk as their prime foundation comply with the above in every respect.
- nove in every respect. 14. No evasion of bulk rules is possible except at an actual reduction in the possible capacities attainable, corresponding to the reduction in the possible capacity of the freedom of the free

- Chapter the Second.

 A. Taxing the model in any directions or for any of the peculiarities in the distribution of its mass is saddling the talent displayed in giving it shape with an unjustifiable weight.
- It is giving a bonus to an equal mass seeking by special shape to
- D. It's giving a norms to an equal mass seeking by special shape to evade the directions or peculiarities taxed.

 C. All measurement rules inflicting penalties upon shape must end in the provalence of a protocled type the least affected by the rule, all others being legislated to the wall.

 D. Free modeling becomes impossible under a rule taxing shape in
- any manner.
- any manner.

 E. An evasion of rules taxing shape is possible without an actual reduction in the mass and the qualities obtainable therefrom, thus discriminating against a model in which for good reason no such evasion has been sought by an uncalled for and unjust exaction of "time." As examples the efforts witnessed in the fleet to overreach one another by the stunting of length and expansion in beam. Or the squeezing of beam and a stretching of depth. Or the striveling of displacement and the bloating of body above water, according to the direction or feature most heavily levied upon; the mass being nevertheless made to do duty in places the least affected by the propensities of the rule in force.
- of the rule in force.

 F. No rules taxing shape can comply with the axioms set forth in Chapter the First. They are therefore faulty in conseption and as a sequence unfair in their application as well as misleading in their effect upon the estimate of value attaching to various forms.

MEASUREMENT.

MEASUREMENT.

Editor Forest and Stream:

In your issue of February 2, I notice a letter from Com. John Hyslop can be a seen and the see

against the bulk rule, that it taxes freeboard, would apply equally well to his own plan, or to any other, including the depth.

Com. Hyslop's strongest argument seems to me to be the fact that a tentonner can carry her ballast in a more advantageous position than a larger bont. But it is an undoubted fact that the fentonner will come about in half as much time as the thirty or forty-ton vessel. If we are to tax the small boats for one quality inherent in her size, why not tax are the small boats for one quality inherent in her size, why not tax are the small boats for one quality inherent in her size, why not tax are proposition to tax ballast as to its position angest themselves.

Any proposition to tax ballast as to its position of such a rule, unless a heavy tax is laid on beam also, and this would certainly not be fair to existing boats. Such a rule would produce narrow, shallow boats valuable principally as coffins. That outside ballast makes a vessel short-lived, may be true, and I may go further and assume that it makes a representation of the stronger principally as coffins. That outside ballast makes a vessel short-lived, may be true, and I may go further and assume that it makes a representation of the short lived in the short lived, any be true, and I may go further and assume that it makes a representation of the short lived in
MEASUREMENT.

WEASUREMENT.

WE had announced our intention to refrain from a further consideration of the measurement question, believing the matter had already received its full share of attention in Forest and Stream. The appearance of a letter in our columns from such a well-known expert as Commodore John Hyslop is our excuse for formulating in Fesh fashion the principles which should govern the inception of modification the principles which should govern the inception of modification and the state of the principles which should be such as the principles of the principles which should be such as the principles which should govern the inception of modification and the state of the principles which should be such as the principles of the principles which should be such as the principles of the should be such as the should be such as the principles of the should be such as the should b

SAIL MAKING.

Editor Payest and Stream.

For the benefit of any of your readers who may be building criters this season; I will give my rules for cutting, eigening, and handling the sails. Will commence with the most important, he say the sails. Will commence with the most important, he say the sails. Will commence with the most important, he say the sails. Will commence with the most important, he say the sails. Will commence with the most important, he say the sails. Will commence he mast one-third the length from stem, in this case 12ft., cut stay-sail one-sixth longer on foot than distance from stem-head to mast, which would be for this boat 2ft., making the sail lift, on the foot; the hoist of sail may vary according to stability of boat, or owner's the sail of the sail of the sail that the sail that the foot of the sail on the cutting floor, allow for a single hem of three inches, lap for lift and same for leach, but allow enough margin at the foot to make a hem of same width that shall be at least four-ply (four hickness of carvas). After the several cloths are stitched together and a single row of stitching is run around the edge, put on the bolt trope, beginning on the foot of the sail, two feet back of the tack, his still the properties of the sail that sail be at least four-play that it is the sail that the sail t

AMERICAN CANOE ASSOCIATION.

AMERICAN CANOE ASSOCIATION.

THE first printed p unpilet of the A. C. A. has been published and samples sont to all members. Additional copies can be promised for samples sont to all members. Additional copies can be promised slingerlands, N. Y. At a meeting of the American Canoe Association, held in the wigwarm at the Canoe Islands, Lake George, Warren Co., New York, in August, 1881, Article 8, on publications, of the constitution, was abolished, and N. H. Bishop, secretary, was instructed to publish an "Association Book" in the following December for distribution among members—duplicate copies to be sold to applicants at cost.

The solution was alternative to the solution of canoes, saffing rules, etc.," to send a copy of the results of its work, after its adoption by the association, (the voting to be done through the post office) to the secretary, who would incorporate the same in the Association Book, with a list of officers, inembers and canoes of the American Canoe Association, as well as such information as might be deemed necessary.

Association, as well as such information as night be dectued necessary.

As the duties of this committee are onerous, time has not been allowed for the completion of the difficult task assigned it; consequently the secretary can publish only such material as has been furnished him. The list of cances has not been filled out by the members, and in many instances the private signals have not been sent in. Members who have not performed these duties will please correspond with the newly-elected secretary. Dr. Charles A. Nedle, of Slinger-lands, albany Co., A. Y. Dr. Neide will publish the new constitution as a temporary guide until a large membership could be secured, can be obtained from Dr. Nedde.

Until the new constitution is adopted, the following articles from the old one will be of service:

Akricke J. NAME AND OBJECT.—This association shall be called The American Canoe Association, and its object shall be the promotion of

ART. 2. CAPOES.—A cannos, to be placed on the association list and to be entered for races, must be a boat sharp at both ends and not nore than thirty-six inches in width on deck. She may be propelled by sails or paddle, or both; but she must be capable of being efficiently propelled by a double-bladed paddle.

Aler, 3. MERGERSHIP.—AD a deceded by a three-diffus voice of the association who has been aleeted by a three-diffus voice of the directors,

or has become a member of a branch club, and who has thereupon paid his initiation fee and annual dues for the ensuing year; but only cance owners shall vote at association meetings or be eligible for office.

office.

ART. 7. INTITATION PERS AND DUES.—The initiation fee shall be one dollar, and the animal dues shall be one dollar, payable in advance to the secretary or treasure.

ART. 9. CLUI SIGNAL.—The association signal shall be a pointed burgee, filters inches long and ten wide, of red, with a longitudinal stripe of white two inches wide, on which shall be displayed in red the letters A. C. A.

All funds should be sent to the secretary in a registered letter, or by rostal money order.

ART. 9. CLTD. SIGNAL.—The association signal shall be a pointed burgce, lifteen inches long and ten wide, or red, with a longitudinal stripe of white two inches wide, on which shall be displayed in red. the letters A. C. Ab. so sunt to the secretary in a registered letter, or by postal maney order.

Ladles may become honorary members by action of the Board of Directors. All persons of respectable character, of any age, who possess a true love of nature and camp life, and who are in earnest sympathy with the brotherhood of cruising canceists, whether owners of cances or not, are eligible to membership.

Among canceists there are no professionals; only amateurs are admitted to the brotherhood. When cances are used for the purpose of with professionals and denied membership.

Lake George is thirty-four miles long and from one to four miles wide, with wild mountainous shores. From the south the lake is reached from Albany by the Rensselser & Saratoga R. R., which will be completed to Caldwell, the southern end, by June, 1883. Cances and camp letts earl be consigned to Lewis & Co. Express, Caldwell, Lake George, Warren county, N. Y., to be held until the owner's cartillar of the complete of the compl

A NEW YACHT CLUB.

Editor Forest and Stream:
On Dec. 1, 1881, soveral gentlemen, representing about half a dozen yachts, organized the New Haven Yacht Club, the first ever formed

On Dec. 1, 1831, soveral gentlemen, representing store and variety, organized the New Haven Yacht Club, the first ever formed here.

They now number nearly sixty members, and have enrolled twelve cabin sloops, from 26ft, to 50ft, in length, and one steam launch. Have handsomely furnished club rooms in the Yade National Bank Building, and expect to open the season with a club 150 strong, representing thirty yachts. Their club book is in the hands of the printers, and a bill to incorporate the club is before the Legislature now in sessing the company of the season with a club 150 strong, representing their yachts. Their club book is in the hands of the printers, and a bill to incorporate the club is before the Legislature now in sessing the company of the season with a club is the season when the present officers are as follows:

The present officers are as follows:

H. D. Billard, Commodore; Jas. G. Beecher, Vice-Commodore; Geo. E. Dudley, Fleet Captain; Frank P. Tyler, Sceretary; Albert W. Adams, Treasurer: Mercill White, Measurer. Trustees—E. S. Perry, F. H. Baldwin, L. A. Elliott, Jr., C. R. Waterhouse, Jr., J. Macauley, Regutta Committee—H. W. Vail, Edw. B. Lee, W. W. Price, C. W. Rawson.

ST. AUGUSTINE YACHT CLUB.—The following officers have been elected for the season: Commodore, A. V. H. Le Roy: Vice-Commodore, E. V. (Clark; Secretary and Trosaure; Albert Tracy: Ressurer Herbert Gardner; Fleet Surgoon, Dr. J. H. Patzki, U. S. A. House Committee—H. P. Annuidovan, James M. Davis, George Booth, Regatta Committee—H. D. L. Willoughby, Carroll Livingston, J. D. C. Hoskins, U. S. A. Colonel Tracy was re-elected a trustee for the ensuing three years.

AMERICA CUP.—In consequence of a clerical error in the documents sent us, the following clause was omitted from the new deed of gift published last week: "Vessels intending to compete for this Cup must proceed under sail on their own bottoms to the port where the contest is to take place."

CORSAIR.—Mr. C. J. Osborn has sold the steamer Corsair to Mr. J. Pierrepont Morgan, of New York. The Corsair is 185ft. over all, 185ft. load line, 20tf. ein, bean, 14tf. deep, 10tf. 5in, draft. Eagines, 4f and 3fm. diameter; stroke, 24in.

24in. diameter; stroke, 24in.

YAWLS.—The yawl rig is destined to become a favorite among cruisers. Air. Chaphames is rigging three of his Nonparells that way, and Lennox, of South Brooklyn, is building a yawl for cruising 24 over all, 24K, lond line, 10K, beam, with a cubin 11K, long and 4ft. 6in. over all, 24K, lond line, 10K, beam of the control
same builder will also start another and larger yawl.

QUAKER CITY VACHT CLUB.—Elitor Forest and Stream: Our
club held its anniversary Feb. 8, at the club house on Windmill Island,
opposite Pilanticiphia. The election of officers resulted as follows:
Commodore, Robert S, Austin (Coquette); Vice-Commodore, Benj. F.
Murphy Gladhon S. Thomas); Rear Commodore, Thomas B. Carpenter
(Thomas J. Pratt); President, William Post (Post); Secretary, Charles
S, Salian; Assistant Secretary, William S. Hoffman; Treasurer, Robert Baird (Stella); Measurer, John C. Vanderslice (Coquette). Trustees.—Charles S. Austin, William L. Boggs, R. P. Thompson and
Charles B. Magee. Regatta Committee—John McCormick, William
J. Thorman, A. F. Bancorft, Lawrence Coleman and Robert Biddle,
Jr., A supper was then served to over forty members.
WANDEERE,—Mr. E. D. Morgan is bound to the southward in

WANDERER.—Mr. E. D. Morgan is bound to the southward in the schooner Wandeter, 197 tons. She has had her yards sent ishore and new spars have been stepped for the usual forc and af-

DAUNTLESS is bound for the Labrador coast next season. It is sea cruising of this sort which will make sailors of our yachtsmen and teach them how little we really know of the sport in America as yet. We should like to see our flects attempt a fortnight's cruise to Bernuda nextyear for a change upon the stale Sound diriting. What a

world of new things such a voyage would disclose to those who have never been off somuling, and how the traps would be discondited. There is no reason why yachts of forty or fifty feet should not make the trip every summer. Cutters from ten tons up could do so without danger or discomfort, yet what a plight our sloops would be in, even the largest of friem, should they be put to real work such as thorough yachtsmen would most enjoy.

SENSIBLE—The New York Y. C. will resolve to abolish the band master's uniform which has so long occupied pages in the club book, but nover was relished on shipboard. The Seawahhaka Y. C. has already substituted rubber buttons and abolished the stripes on the sleeve. Others may follows uit. If freeworks and fandangos could only be sent the same way and sailing be made the object of club, and fandingos could only be sent the same way and sailing be made the object of club.

AMERICA CUT—The Carnatians done like the limitations set upon the chart of the Cup in the new elevel of gift. Small blame to them; but let them carry their goains and energy to the coast and descend upon us from Adantic's rocky shores. The schooner Alarm, 10 tons, of Buffalo, will come ont with double head next year, running how-sprit and jib set flying cutter fashion. We expect to build a thirty foot keel cutter here in Buffalo, of which more nuon—Cut-pres.

TWO-TONNERS.—To many inquirers we answer that we cannot furnish working drawings of the two-ton design published last February. Possibly Mr. W. P. stevens, West New Brighton, Staten Island, can upply the demand, as he laid the load down in his loft and faired her up.

Itself working many reserves the second of the property of the control of the property of the control of the property of the p

was not touched.

YAWLS.—We have in type some interesting accounts of experiments with the yawl rig on the schooner White Cap and other yachts in Boston, which are delayed till next issue. The rig was found a perfect success, and is likely to become very general among cruisers.

A BID FOR THE COURSE,—Editor Forest and Stream: We would hereby invite the National Association of Amateur Oarsmen to hold their national regatta for 1889 on Greenwood Lake, X, Y. We can give them the finest straightaway four mile course that can be found.

—W. O. McDOWELL, Secretary.

MODERN IDEAS.—Keel sloop Fiona, Mr. I. Gray, Dorehester Y. C., omes out next season with 4,000lbs, iron on keel. She is 23ft, 6in, over

all.

MURIEL—This cutter, recently sold by Mr. E. D. Morgau, was not sold much below her cost, as reported. She brought a high figure—nearly what she cost to build. Only a year ago \$500 more than original cost was offeced but refused. She is now in her fourth year. As a more site showed good speed upon occasions, though there was a more step showed good speed upon occasions, though there was a more step showed good speed upon occasions, though there was a more she should like to see her tried in the modern type, being of light displacement, which, without much beam, is always a doubtful experiment.

heent.

LENA.—This sloop, built by Woods Brost, of East Boston, in 1878, has become the property of Mr. Henry C. West, who has been instrumental in organizing the new Corintinian Y. C., of Brooklyn. She will receive a ton of iron outside, new spars and sails and a full cruising outfit. Lena is 4fft, over all.

WINNIE—There are all populys to it. (West told you are "This work.)

receive a ton of iron outside, new spars and salls and a full cruising outfit. Lena is 4ft, over all.

WINNIE.—They are all coming to it. "We told you so." This schooner of Lynn is receiving 3,000lbs. iron on the keel.

AN EXCEPTION.—Not long ago keel yachts were so scarce they were phenomenal. Now you must hunt long to find a centreboard building in the East. Joshua Brown, of Saleu, has one of those peculiar things in frame. She will be 35ft. long and attract much attention from having a board in her. The world moves.

CUTTERS.—Besides the numerous fleet building from home designs, a private letter from G. L. Watson, of Glasgow, says that he has three under way for American customers and expects more orders. Altogether he has eleven new yachts on his board including a smart schooner \$3ft. load line, 15ft. beam and a 700 ton steamer.

FUNNY.—A contemporary evolves the following: "The subject of a

schoener Sit. load line, 15it, beam and a 700 ton steamer.

FUNNY.—A contemporary evolves the following: "The subject of a rule of time allowance is not, as some suppose, a rule which will encourage the building of the best model, but it is the rule which will produce the largest entry of yachts on race days." Well, after that we may expect almost anything, dubious grammar thrown in:

SAN FRANCISCO TOO.—Schoener Cen. O'Conner is harded out, receiving four tons of lead, le-a-d, not iron, on the keel. American yachts, especially beamy ones, are so cheap, you know. Require only gas and cobble stones for ballast. Somehow all hands are bringing up on outside lead, just where Forest AND STREAM started when the war on traps was opened.

DRYING OUTL—Editor. Forest and Streams I have been executive.

In traps was opened.

DRYING OUT.—Editor Forest *and Stream: I have been considering the advisability of putting my yacht on the ways for a month or ot ole their dry out, she being at present water soaked and heavy, alany of my friends advise me against such a course. Are there any bjections to such a plany—C. [We think it would be a decided benefit to allow the yacht to dry, eee that she is protected from the sun and dries slowly and evenly, lean out blige, recalk as wanted, and smooth up with a plane. She till have now life. Allow the air to reach all parts inside as well as ut.]

out.]
NEW TWO-TONNER.—A Brooklyn gentleman is getting out the
lines for a half-decked keel yacht, 20ft, load line, something on the
ltchen boat plan. Such boats would flourish in our waters and be
better adapted for short cruising than the catboat traps or the sand
bag abominations were it not for the length rules and the baneful
habit of shifting ballast.

bag abominations were it not for the length rules and the baneful habt of shifting ballast.

MORE BALLAST ON KEEL.—Editor Forced and Stream: Your sail plan furnished last year has given me great satisfaction. I shall put 1990bs, more iron on the keel of my boat this year, atthough she is only 23ft, long, 7ft, beam and 3ft, 9in draft—not quite a Madge, perhaps, but neither a skinning dish. She takes 5.3 9ibs. of ballast.—ROYAL NOVA SGOTIA YACHIT SQUADEON.—Officers for 1882: Commodore, His Excellency the Marquis of Lorne, K. T. P. C., etc., etc., the commodore, W. A. Chauney, Esq., Elent, P. W. O., etc., etc., for the commodore, W. A. Chauney, Esq., Elent, P. W. O., etc., etc., for the commodore, St. Shoppis Secretary, F. C. Sunichrast, Esq., Treasurer, W. Heddew, Esq., Committee of Management—J. E. Butler, Eone sloop; C. Carter, Lieut, R. E.; A. E. Jones, Dapline sloop; S. C. Whife, Kestrel yawi; A. C. Edwards. Sailing Committee—G. S. A. Handcock, Lient, P. W. O. Regt, Petrel cutter; A. Alison; F. S. West; W. H. Troop; D. G. Prinsep, Lieut, R. A.; Jas, Fraser. Measurers—J. E. Butler, G. H. Luke.

Luke.

PENNSYLVANIA YACHT CLUB—billior Forest and Stream: The annual mosting of the Pennsylvania Yuchi Chub of Philadelphia was held on 7th inst, and the following were elected officer for the season 1882: Commodore, Oscar F. Kern; Vice-Commodore, Da. Barber; Rear Commodor, Chas. Meyner: Secretary, Win, Hardhard, Statistics, Statistics, Commodore, Chas. Meyner: Secretary, Win, Hardhard, Statistics, Charles Wood; Treasurer, Gen. W. Bosler, Measurers—Samuel Brown, John Thompson, Peter Augustine. Trustees—O. F. Kern, S. Brown, G. W. Bosler, J. Vandegrift, Geo. Chadderton.

Riftes—Limited to ten pounds in weight; iminimum pull of trigger, three pounds; 22-100 cal. Teams may furnish their own rifles and ammunition, or use those at the gallery, as they may desire. Number of Shots—Ten by each competitor. Sighting shots—Two shots will be allowed each competitor. Position—Oil-hand, Targets—200-yard targets, according to the regulations of the N. practice allowed on the day of the maich. Entrance Fee—Five dollars to be paid at the office of the FOREST AND STREAM. No. 39 Park Row, N. Y. The match to be governed by the rules of the N. R. A. relating to team.

The above tournament will be shot during the month of March and will be in many respects similar to the contest carried on during the winter of 1879 under the direction of this paper. The intention is to have the records made, and there ought to be at least a dozen team of the contenting of the price of the contenting some particles allowed to the contest carried on during the winter of 1879 under the direction of this paper. The intention is to have the records made, and there ought to be at least a dozen team of contenting the stream of the contest carried on during the winter of 1879 under the direction of this paper. The intention is to have the records made, and there ought to be at least a dozen team of the contenting the team captains to fix upon a suitable gallery in which to have the records made, and there ought to be at least a dozen team, of the match, and a number of other clubs are engaged in preparing teams. The date of closing entries has not yet been decided upon, but will probably be within a fortnight, in order to enable the preliminary meeting of the entrance and the shooting to

PISTOL SHOOTING.

BOSTON, Mass.

Editor Forest and Stream:

In my opinion a good shot with any weapon will be annazed at the proficiency that may be acquired by a little practice, in the use of any revolver of good make. In the first place one should choose a revolver with a barrel at least six inches in length, to secure accuracy in the flight of the ball; then the sights both froat and rear should be arranged so as to suit the shooter, but both should be open sights, easy and quick to the eye. The trigger should be set so that the foreflinger will discharge the weapon easily without drawing the muzzle from the line horseback exercises.

With such a weapon one will be surprised at what can be done. I

of sight, and yet firm enough as to be perfectly safe for outdoor a horseback exercises.

With such a weapon one will be surprised at what can be done subjoin herewith a few of the shots that I made in 1883 while a comissioner in Virginia, taken from a record that I then kept, a although I feel that I could not do as well now, not having practifor many years, still I have the faith that I could do well—the sa

faith that swimmers have who have not been in the water for years, i.e., that they can still swim. The shooting that I am about to refer to was made with successful with a the power on the provice and sugard deadly qualities of this little weapon properly and the still lingers in my memory. The successful was sugarded to the successful was the product shot enumerated you will find a remarkable one, but the ground was preed by myself and the shot witnessed by two students of Lexington College. Lexington, Va., Jan., 1893. Shot from the roof of a house a ben, where she had flown, through the neck, distance estimated at 36 varis.

ds.
Feb., 1868. Broke nine pipe bowls out of twelve at twolve paces.
April, 1868. Shot a dove from horseback through the neck; 37

3. April, 1898. Shot a dove from horseback through the neck; 37 ands, paced.
4. Shot a robin from horseback through the head from a rail feace; tyarks, paced.
5. Millboro, shot a robin's brains out at 10 yards.
6. May. Warm Springs road. Shot a dove from the wagon, through le side; 33 yards, paced.
7. Muddy Creek. Shot five water-snakes, all at first shot, except ne. Two coiled up on stones on further side of the creek, were out-two; distance about 21 yards.
8. May. Road toward Lexington. Shot a blueblir from the wagon the side; distance 16 yards.
9. May. Land's Creek. Shot a squirred through the heart and foreggidistance 39 yards.
10. July 25. Shot eight trout in the water (they would not bite) in m shots.

10. July 25. Shot eight troot in the man, the state that the shots.

11. Aug. 18. Shot a ruffed grouse on the wing, in the mountains while troot fishing, fushing him the second time, being prepared, and killing him with a snap shot.

Sept. 12. Shot for my wife in the Adirondacks a ruffed grouse stiring, at 3) yawls. (to there and do likewise.

TO

The Forest and Stram is the best paper in the United States, in the departments of which it makes specialties. It is emphatically a high-toned gentlemen's paper, and as such circulates from Maline to California. — Havre de Grace (Md.) Republican, Feb. 10.

Feb. 10.

The well-known and excellent sporting journal, Forest and Stream, whose title explains fully its character, has just entered upon the second to th

Forest AND STREAM celebrated the first number of the eighteenth volume by appearing in a fine new dress. Typographically, it is now perfection, and it will be doubly welcome to all sporting men, who look upon it as the representative sporting journal. Success to it now and for all time.—Buffalo Sunday Times.

The last number, February 2, commenced the eighteenth volume of that popular sportsman's journal, Forser And Steram. Its success in the past is a good presage of the future. It aims to be a sportsman's, not a sporting paper, and will be a valuable reference to chose who are fond of hunting or fishing.—Dalton (N. Y.) Exa. Feb.

CON-

The Forest and Stream, the journal par excel-lence of the rod and gun, comes to us this week in an entirely new dress, at the same time beginning its eighteenth year. Its style and spirit is all that the most fastidious sportsman can desire. We wish for it continued success.—Greensburg (Penn.) Press, Feb. 7.

The Forest and Stream has just entered upon its eighteenth volume. This journal is the best of its kind published in the country and has a growing circulation from year to year. The style and spirit is very satisfactory to the multitude of its readers.—Scheenus (N. Y.) Monttor, Feb. 11.

TIN-

On the 2d inst. the FORIST AND STREAM of New York entered upon its eighteenth volume, and celebrated the event is under the product of the control of the control of the little state. The little state is the control of the luntaman and naturalist. In fact there is much to interest the whole family. Those who love to read of the woods, camping out, fishing, hunting etc., will always find delight in its columns.—Ashtabula Sentinel, Jefferson, O., Feb. 8.

FOREST AND STREAM appears in an entire new dress, bright and beautiful, and presents quite an improved appearance. Such enterprise, on the part of the editors, is worthy of all commendation.—Lycoming Chronicle, Williamsporf, Fa., Féb. 10.

UED

Notwithstanding the close call the Forest and Stream received last week in the New York fire, and the serious interruption of business, that journal comes to hand this week as interesting and sprightly as ever, which speaks well for the enterprise of the publishers. On February 2, this most popular sporting journal of the world entered upon its eighteenth volume, which occasion was celeptated by a new dress throughout. The "Sportsman Tourist" and the subscription price. It also contains departments on shooting, sea and river fishing, fishculture, the kennel, yachting, canoeing, rifle and trap shooting, which are every week full of interesting and instructive matter.—Wellsville (N. Y.) Reporter, Feb. 8.

This excellent sportsman's journal came to us last week in an entire new dress and is the very picture of typographical neatness. It is no doubt the most reliable paper of the kind published, and is held in such high estimation by the sportsmen of the United States, that no one who desires reliable information and interesting reading matter pertaining to the rod and gun can afford to be without it.—Wauseon (O.) Expositor, Feb. 9.

Expositor, Feb. 9.

The Forest and Stream, one of the very best sporting papers of the present day, has just entered upon its eighteenth volume, and comes to us ciothed in an entire new dress, ooking as neat as a new bonnet. It concludes all ooking as neat as a new bonnet. It concludes all of the best of the class always allable, coming the best of the class always allable, configuration authors who fully understand the needs of sportsmen, and practical in the science themselves. No sportsman should be without its regular weekly visits.—Castilian, Castile, N. Y. Feb. 10.

OUR

The Forest and Stream last week entered upon its eighteenth volume. The proprietors celebrated the occasion with a new dress of type throughout. This publication is the best of its kind in this country, and its style and spirit commends it to all sportsmen. "By the skin of its teeth "it escapped the recent fire in New York which destroyed buildings around it, and burned out so many valuable papers.—Xenia (O.) Republican, Feb. 7.

The Represe viv. Server, it is the state of the property of

The Forest and Stream is the great American sportsmen's newspaper. It recently donned a new dress of type which makes it doubly enjoyable. All there is worth knowing about fishing, hunting yachting, canceing, shooting, trapping, dishculture, the care of dogs, horses, game, fish, guns and other matters of interest to sportsmen, may be found in its ample pages.—Bay City (Mich.) Tribune, Feb. 8.

ANSWERS TO CORRESPONDENTS.

OUR FOREIGN MATCH.

If the details for the proposed international match are not fixed upon in a very few weeks, we may conclude that there will be no meeting of English and American marksmen at Wimbledon this year, and that the most favorable opportunity that has ever presented itself for a real live match has been thrown away. The flow of talk has set in, and every would-be manager and actual mis-manager has been airing his opinions through the press. We have had prognostications by the score, and all sorts of owl sense by the column, but all the time the American managers were insisting upon what was, at least, an entirely irrelevant point, and what may yet be shown to be an impossibility. To demand that a team shall come to these shores in 1883 is an impertinence, and when that demand is backed up by the assertion that unless it is granted it will be impossible to raise an American team for the present year, there is a distortion of fact and a prevarication unworthy of those who resort to it. As a matter of truth it will be entirely possible to raise a team for the present year and to fight a contest at Wimbledon with very good chances of success. We have not, to be sure, a large body of military shooters who are familiar with the use of military breech-loaders at the long ranges. We have not the weapons for that practice. But what of that? We know precisely what is needed, and a few weeks would supply our men with the long range, small bore barrel, mounted on a military stock, which seems to fill the "M. B. L. class" at Wimbledon, and which one of the proposed conditions requires the rifles to fall under. The permitted manipulation of the open sights by detachable wind gauges and otherwise will permit the finest gradations to be observed in dealing with the wind and light, and it would not be long before men who are naturally good holders and have a perfect eyesight, could be trained into a team where each man could help his fellows, and where each succeeding shot should have the benefit of the experience of all the preceding shots. There are no insurmountable obstacles to our producing a body of twelve men with a perfect team system to help them, and while the British team would have the slight advantage of familiarity with the ground, this would be nullified by the each-man-for-himself style of shoot-

issue of a match. If we win, the victory will have a commercial value in establishing more firmly the claim of American armorers of being the best fire-arm makers in the world. It will add another to the long and nearly complete list of American sporting victories abroad, and it will enable us to rest at home until some of our open matches at Creedmoor and other ranges have been filled by British riflemen. A defeat would remain such but a short time, for we mistake very much if our American pluck will not lead to an immediate wiping out of the bad record. It will not suffice to go off with a grand hurrah and expect to win the match with a rush. On the other side will be found men who are great sticklers on small issues, and the team to go over must be prepared for some irritations from this cause. Everything must be looked calmly in the face, and the most extreme chances against us calculated. At present there is nothing which can be made use of as a guide. What records we have are not available, since they are so few as not to be worth anything in making up an estimate. The shifting of the target divisions on the Wimbledon range has confused the records of the practice there in large measure, but there are the scores of the Queen's cup contest by which the nascent American team could gauge their powers as against the English marksmen. The match would bring out the fact that the finest military shooting at Wimbledon is really done by small-bore marksmen. Sir Henry Halford is a member of the volunteer force, and with him may be named a great many other riflemen known to us principally as long-range men. There are prizes innumerable on the many English ranges open to volunteers only, while there are very few for civilian shooters who care only for long-range work. The tendency therefore has been to encourage the joining of the volunteer force on the part of those fond of shooting, and consequently there are not more than a dozen good shots in the kingdom who may not enter into the contest for place on the team to meet the Americans.

PROTECTION OF LARGE GAME.

S OME weeks since we published an appeal for the protection of large game in the West, and urged the importance of some measure being taken to prevent the extinction of our larger mammals in the only section of the country where they still abound. The necessity of prompt and efficient steps by the Legislatures of the various States and Territories was insisted on.

It is satisfactory to learn that speedy action has been taken on this most important matter by the House of Representatives of Wyoming Territory, and it is hoped and believed that the bill which has been introduced will meet with no opposition in the Council of the Legislative Assembly of the Territory. The Legislature have gone to work in the right way to stop the slaughter which has been going on for so many years, and a provision has been inserted in the bill against the traffic in the green hides of all game animals. No hides in the hair or untanned state can be dealt in, nor can they be transported by common carriers or others. This provision strikes at the root of the matter, and if it can only be enforced will have the very best effect, and will prevent much of the destruction that now takes place. The prime factor in the rapid extermination of the large game of the Territories has been the lack of enactments to restrict the bloody hand of the skin hunter, who kills only for the hides and pelts. Thousands of our most superb game animals are annually slaughtered for these alone, and tons of wholesome and excellent food left to rot on the ground, or to furnish

food for the coyotes, the ravens and the magpies.

In the bill referred to, which passed the House of Representatives February 16, provision is made also against the shipment of game out of the Territory. Killing is permitted only to an amount sufficient for home consumption for food. The making of large bags is discouraged, by limiting the number of grouse and other birds to be killed, to the number of twenty-five. Ducks, geese and other migratory birds are all protected, as are also rabbits and squirrels.

Small game is still further protected by the passage of an act providing for the payment of a bounty to persons killing mountain lions, bear, wolves, covotes and lynx, as well as hawks, eagles and other rapacious birds. taken together would seem to furnish protection to game against the depredations of man as well as beast.

ing which marks the effort of a team over there.

To make assurance doubly sure, however, the sportsmen of the prospect of success is sufficiently bright to encourage the Territory are organizing a Game and Fish Protection the sending of a team over, and if the managers of our Association, and when this is in shape we trust that we may To make assurance doubly sure, however, the sportsmen of

hear of good work done by it. It is likely that a license act will be brought forward by this association as a separate measure

We hope to see some such provision acted on, and trust that it will limit the number of heads of game to be killed in any given time. Nor should any part of the animals killed be wasted.

We have been urging the importance of this matter for years, and it is satisfactory to see some practical results from our labors.

As long ago as 1876 we called attention to the subject in language which will bear repetition here.

Good hunting is at present scarcely to be found east of the Missouri River. West of that stream, however, there is a wide extent of territory, in many parts of which large game of all descriptions may still be found in considerable abundance by those who are sufficiently acquainted with the country to know where to look for it. There remain on the plains and in the mountains seven species of ruminants that are sufficiently abundant to make it well worth while that the different State and Territoral Governments should attempt before it is too late to protect their game by severe laws-buffalo, elk, white-tailed deer, mule deer, antelope, mountain sheep moose are still to be found in considerable numbers in various portions of the trans-Missouri States and Territories, but owing to a savage and indiscriminating warfare which has been inaugurated against them within the past few years their numbers are decreasing more rapidly than ever before.

Most of us remember the good service done some years ago by Gen. Hazen in bringing before the public the facts in regard to the wanton destruction of buffalo along the line of the Smoky Hill Road in Kansas and Colorado. The discussion at that time resulted in the adoption of some measures to protect the buffalo, though it is to be hoped that ere long still more stringent laws may be enacted and enforced. But we have just now to speak of a country distant from the railroads, out of the way of the average tourist, and far from the haunts even of the gentlemen sportsmen; we refer to the territory lying between the Missouri River and the main divide of the Rocky Mountains north of the Union Pacific Railroad. It is in this region that the most abundant supplies of wild game are to be found, and it is here that these animals are slaughtered for their hides alone by the professional hunter.

Buffalo, elk, mule deer and antelope suffer most, and in the order in which they are here mentioned. They are de-stroyed without regard to season; the hides only are taken and the meat left to feed the wolves, or to rot when the spring opens. We know directly of thirty-four cow elk killed out of a band of forty, about the middle of April, 1875, by one man. The snows were deep, and the butcher followed the poor animals until all but six were slain. Each of these animals, if allowed to live, would have produced a calf in a little over a month after the time of its slaughter. Here then were sixty-eight elk killed by one man in a day and a half. It is estimated from reliable information that in the winter of 1874-5, during the deep snows, over three thousand elk were killed for their hides in the valley of the Yellowstone between the mouth of Trail Creek and the Hot Springs. For the Territories of Wyoming and Montana the destruction must have been twenty times as great.

The prices paid for elk hides were at that time sufficiently

renumerative to pay good wages to an ordinary hunter, when game was as plenty as in those days it used to be. Buffalo killing paid, too, and could be done by any butcher. For, as many of us know by experience, a man without any pretensions to being a skillful hunter can slaughter a dozen or two buffalo in a day wherever they are numerous. Mule deer and antelope are more difficult to kill, but in these days of breechloading rifles a fair shot can kill several out of a band before the rest can get out of reach. It is a melancholy sight to see as we have in a morning's march, half a dozen fresh doe antelope carcasses stripped of their skins, with the milk still trickling from their udders; and it is sad to think that in addition two little kids must starve for each of these.

Mountain sheep and moose do not suffer to any considerable extent from these skin hunters. They are too wary to be successfully pursued by these men, many of whom are vagabonds of the most worthless description. There are some good hunters and good fellows among them; men who would gladly relinquish the business could it be wholly stopped, but who think and say that if the game is to be exterminated they must make the most of it while it lasts. Taken as a whole, however, they are a miserable set, and many of them do not kill more than enough to keep themselves in provisions and ammunition from month to month. If all

were as good hunters as Yellowstone Kelly there would now be scarcely an elk or an antelope left in Montana.

Skin hunting in Montana was not carried on to any very great extent until about ten years ago. In the article from which we have already quoted we said: In 1872 or '73 a firm of Fort Benton traders, who have since achieved an unenvi able notoriety by selling arms and amunition to the hostile Sioux, conceived the idea of fitting out parties to kill game for the hides, and the result was so successful that the trade in wild hides has been increasing ever since,

What now can be done to remedy this state of affairs? Stringent laws should be enacted, and not only enacted but enforced. Game should not be killed except for food, and then only during the autumn. In other words, no more game should be killed than the hunter can use, and indiscriminate hunting at any and all seasons should be prevented. But we know that legislative bodies move slowly, and that knots in red tape are as difficult to untie as that of Gordius of old. In the meantime much, very much, may be done by the officers of the army who are stationed on the frontier. The skin hunters, who, of course violate the laws of all the territories which have game laws, may be warned off, arrested, or so annoyed that they will in future sedulously avoid the vicinity of posts where they have received such treatment."

We shall have more to say on this subject at a later day. It is satisfactory to see that the Territory of Wyoming appreciates the importance of game protection and takes such an advanced position on this matter. It shows that her citizens are intelligent, far above the average of men, and the older States which are still lagging behind, may well be ashamed to see themselves so far outstripped in this honorable race.

SPITTING ON THE BAIT.

HE small boy in the country and the lounger on the city docks, both of whom fish with hand lines, regard it as a point of fishing etiquette to moisten the bait, be it clam or worm, with saliva, before imparting that rotary motion to the sinker which hurls the line by centrifugal force into the far waters, where the big fish are supposed to lie. The custom seems also to be part of the ethics of other anglers who are not included in the above classes; and the student of ethnology may be interested to know whence the practice comes. have long felt that it was a subject worthy of careful research, as are all things which relate to the customs of mankind in different parts of the earth.

Whether the youthful Egyptian, who has played "hookey from his district school and gone fishing among the rushes on the banks of the Nile for the electrical catfish, Malapterus electricus, spits on his bait; or whether the juvenile Hindostance roaming over the marshy land between Bahar and Patna looking for the climbing perch, that curious member of the family of Labyrinthiform Pharyngeals, the Anaba scandens, in the tree tops, throws aloft a bait moistened in this manner, we do not know. The manuscripts found in the crypts of the pyramids are silent upon this subject, but Commander Gorringe, whose opinion is certainly entitled to respect, thinks that a figure on the Central Park obelisk, whilom yelept Cleopatra's Needle, might be interpreted as a boy in the act of expectoration upon something which might be a fishbait. The writings of the great Jampooter are also silent as to the custom in India. In his learned fourteenth treatise on the Saml Whang Hi Muck Muck, Meen Fun, the Chinese philosopher, distinctly alludes to the custom among the fishers of lake Tong-ling Lou, in the Hoo-nan district, but gives no clue to its origin.

There can be little doubt that the Esquimaux incantation of spitting upon the water before beginning to fish, and uttering the magic words: "Soax soax oonagah soax," is practically an offering to the same divinity of fishes; an invitation to the king of the fishes to come and be caught. The Patagonian custom of kissing the bait, and the Icolandic usance of blowing upon it, are no doubt all related forms of the same super-

Schweinwurst, the celebrated admiral of the Swiss navy, while sailing his fleet up the Matterhorn, records the following facts: Being sceptical in regard to the virtues of expectoration upon the vlands offered to fishes, or at least wishing to test the matter in a true scientific spirit, he ordered his men to cast their lines from each side of the *spund*, one side to spit upon the bait and the other to cast without spitting, and set accountants to record the result. With evident pleasure he chronicles that there was no difference in the results attained, and to him must be accorded the first truly scientific investigations in this line. He surely es tablished the fact that upon one occasion, at least, the nonspitters were as successful as the spitters. Of course those who favor spitting upon the bait may quote the well-worn adage that "one swallow don't make a summer," but they lack statistics to prove that spitting on the bait is of real advantage, for they cannot cite a case where it has been brought to a test and decided in their favor, as in the case of Schweinwurst, whose precedent is followed to-day by every sailor in the navy of Switzerland, none of whom now spits upon his bait.

In all matters of this kind Forest and Stream is entirely unprejudiced and will present all sides of a question, no matter whether it agrees with any preconceived views of its own or not; its principle being the only true scientific one, a desire for truth. Hence, we give place to the following by an early English writer who quotes John Smith,

the preserver of Pocahontas. He says: "There be certayn persons who when they fish do spit upon their bayte in hope of propitiating the fishes and thereby causing them to byte more freely, not knowing that the originator of this custom used the word 'spytte' in the sause of runnynge through, as we spit a fowle before the fire. 'Spytte yr worme ypon yr hooke,' wrytes John Smith from Virginia, and this I thynke me means to ympale him ypon it."

Smith's definition of spitting a worm is very good, as far as the English language goes, and we might be inclined to accept it if it were not for the facts which our studies have uncarthed, as given above, which show that the custom obtains where the English language is unknown, and consequently his deductions are at fault. We have shown that the custom, while slightly differing in widely separated parts of our earth, has its origin in an antiquity so remote that the only hope of tracing it to its source lies in the discovery of manuscripts more ancient than we now possess, or in a more careful reading of the Runic legends.

KEEP UP THE FIGHT.

T is not to be gainsayed, but it is greatly to be regretted, that the things not wanted will come in and grow and thrive in spite of all "lord of creation" can bring against them, and the forces of nature which sap the life of the useful plant seem to foster the noxious weed. When the clover and herd's-grass are burned to death with drouth, the weeds flourish. Wild wormwood and pigweed flaunt their grim banners when "the ranks of spiky maize" have rolled up theirs, and daisy and succory blossom while the good grass dies. Who ever saw a sick burdock, or a nettle that had been trampled to death?

And it is the same with animals as with plants. The crows hold their own against the warfare of all mankind, while the ranks of the wild ducks year by year grow thinner, and the tick only pleasantly scratches the back of the owl, as tough alive as he proverbially is "biled," while he kills the If migratory quail would but increase as the pestilent English sparrows have, what glorious days for the sportsman! If mosquito "wigglers" would only grow to be fish, what glorious nibbles instead of such cursed bites! If herd's grass and clover would but hold their own against daisy and St. John'swort, how would the husbandman rejoice! the farmer keeps up the fight, though it often seems a losing one, and out of the warfare wrests tribute from the soil. Shall the sportsman surrender to the forces which oppose him, and lay aside the rod and gun? Life is possible and even endurable without a bird to shoot or a fish to catch, but for some of us it would be vastly less enjoyable under such conditions. Stand fast, then, all ye of the goodly fraternity. Uphold the laws for fish and game protection, do missionary work among the masses, and, above all things, set a good example to those whose eyes are upon you, who look to you for their lessons, and will justify their misdeeds by

FRANCIS HOLMES SELDEN .- We are deeply pained to learn of the death of Frank H. Selden, who died at his home in Moodus, Conn., Feb. 2. Mr. Selden was assistant editor of the Connecticut Valley Advertiser, and was a well-known contributor to many other journals, among them the Forest AND STREAM. He was gifted with literary abilities of a high order, which, united with a kindly nature that won the regard and affection of his associates, promised for him a life of growing honor and influence. The community in which such a man dwells is directly benefited by his upright life; and so must we count his death a public loss.

Transplanting Quail.-We should be much pleased to hear from clubs and individuals who have received live quail from the South or West to be used for stocking purpose comparison of experience cannot fail to be of service in respect to further efforts in this direction. We have had several discouraging reports of large lots of quail, of which most have perished. It is desirable to know the percentage of success attending these most laudable efforts to replenish the supply of game birds.

EASY READING LESSONS-III.

FOR THE LITTLE READERS OF THE FOREST AND STREAM.

Hark! What is That? Is it the Roar of the Sea on the Rockbound Coast, or the Rumbling of Thunder? No, it is a Sports man. Is the Sportsman a Lion or a Bull that he Roars and Bellows! The Sportsman is not a Lion nor a Bull. The Sportsman Bellows because He is Mad. Why is the Sportsman Mad? The Sportsman is Mad because His Dog is Wild. Why is the Dog Wild? The Dog is Wild because He has had no Work. Is it the Dog's Fault that He has had no Work? No, It is the Sportsman's Fault. He has kept the poor Dog on Chain for Three Months, and now He expects Him to work Close and Steadily. Is the Dog Deaf that the Sportsman Bellows so Loud? No, the Dog is not Deaf, but the Sportsman has Taught Him to Mind only when he is Bellowed at. Will not the Dog Mind if He is spoken to in a low Tone? Yes, the Dog will mind if He is spoken to in a Low Tone. But the Sportsman Likes to Exercise his Lungs, when He is out Shooting. He Thinks it makes the Birds Lie better. What does the Sportsman say? The Sportsman sometimes Says Things that Good Children Should not Hear. When You Are older You will Know what He Says,

The Sportsman Courist.

A MEMORY.

REMEMBER thou, dear friend, that winter night, when down the lake came keenly the crisp sparkle- The long beams of the icy moon that sparkle. Dazzling the sight?

Rememberest thou, dear friend, that lonely skate, When from the northern woods the gaunt wolves' howling When the swift air bore shuddering their howling.

Demoniac with hate?

JOHN PRESTON TRUE

"SKILLETS"-A CAMP SKETCH.

"SKILLETS"—A CAMP SKETCH.

He was always a mystery to us—a conundrum that we were perpetually trying to guess, but were finally forced to "give up." Where he came from, none knew, and his destination was equally veiled in obscurity. Personal history he had none; to all interrogatorics as to where he was born, where he had lived, where he was going, he had the same vaguely placed answer—"Dunno." Many were the guesses indulged in as to his nationality. Diabet, that great touchstone of nativity, failed us here, for he used in his talk the idioms of all localities. John insisted he was a pike from Missouri; Ignotus, that he was plainly a Yankee; the Rhymer leaned to the opinion that he was either a "Nawth Ca'liny" Tar Heel or a Jersey Sand-Hiller, while Didaskalos stoutly maintained that the West Riding of York, or the fens of Lincolnshire had given him birth. Help from him, on these and similar disputed points, we got none; against his granitic "Dunno." our flood of questioning brake in vain.

He came to us in the gray of the dawning, but whether sprung from the sage brush, dropped from the morning star, or like his great ancestor, Adam, a direct product of the soil, no one knew. He was there, by the camp-fire, when we turned out one morning, and to John's bluff query, "Hullo where the — did you come from?" responded screnely, "Out yander," with a vague sweep of his arm toward the Northern and Eastern horizons. That was all of his history we ever learned—so far as we were concerned he was literally "a man without a past." After breakfast he took so naturally, and even kindly, to the washing up of the dishes, that when to John's puery, "Well, what are you going to do with yourself?" he calmly replied, "Stay with you uns a while, freekon"—no one said him nay. Asked what his name was, he hesitated, "reckoned he didn't have none," and when pressed as to what people called him, only answered, "Most anything they durn pleased."

Ignotus cirristened him Dunno, from the charactee of most of his replies; John, more practic

Rhymer named him the Gentle Gazelle, from the air of thind meekness which he always wore, while Didaskalos always insisted on addressing him as Three-spot, "because," he said. "he beats the deuce."

All these appellations, however, proved merely sporadic, and were finally merged into "Skillets," which was tacity adopted, partly from his daily toil, but chiefly from the plaintive wall with which we soon became familiar, of—"They haint nobody seen my skillet, haint they?" referring to his one piece of personal property, a dilapidated trying-pan, to which he clung with the fond devotion of a timdoo to his idol. Battered and worn, part of the handle gone, and the bottom bulged out in a dozen different places, it held a place in his affections from which the finest nickle-plated "Charter Oak" or "Kitchen Queen" could not have ousted it.

There was indeed a wild legend to the effect that John, waking one night, and hearing a nurmur of voices outside the tent, was led to investigate, and found this cherished piece of culinary apparatus propped up against a pinor tree, and before it "Skillets," grovelling on the ground, and muttering some unintelligible prayer to his greasy fetish. This report, however, could never be localized, and probably originated in some jesting remark, which grew by successive accretions, as it passed through the lins of verious imaginative members of the party.

Simple and guideles, childlike and bland, he was the only at-all-times-and-under-all-circumstances thoroughly good-natured person I ever met. Nothing had power to ruffic the calm screnity of his temper, When Huz, our vicious little Spanish mule, lashed out one night and shot him, as from a catapult, head-forenost into the fire, while Swipes, our bult-terrier, roused from a dream of fierce conflict with prowling coyotes, scized him by the leg, and worried him as he would a rat, his only remark, as he scrambled to his feet, and brushed the ashes and coals off with one hand, while he caressed his lacerated leg with the other, was, "Orat th Saxon, of Didaskanoss more classic college onjurgations, or of Shanipaw's polyglot of mingled Navajo, Mexican and trapperesque Billingsgate. (By the way, commend me to the Mexican for a wealth of imprecatory language that would have delighted the heart of the toughest Sergeant of "our army in Pianders." John says that they can call a man a blanked fool in fifty-one different ways, and then have a few

army in Finaders." John says that they can call a man a blanked fool in fifty-one different ways, and then have a few left as a reserve in case of need.)

As to Skillet's personal appearance, it could not be truthfully said to be prepossessing. His age might have been anywhere from twenty to fifty. Tall and gaunt, his spindling body was topped by a bullet head, crowned with a few wisps of tan-colored hair, while a fringe of sandy whiskers encircled a freekled, putty-hued face. Long arms, reaching nearly to his knees, ended in hands much the size and color of a ham of bacon. Splay-footed and knock-kneed, his gait was a cross between the shambling trot of an over-fed cow and the lumpy waddle of a duck. His ugliness was so extreme that it actually verged on the picturesque. He seemed a compromise between Cahban and Crusoe's man Friday. Like them, he might have lived all his life on a desert island, for his ignorance of the commonest things was plenomenal. He didn't know the difference between a halter and a hanestring, and once when, in his zeal to be useful, he volunteered to saddle Rob, it was said that much enduring animal appeared at the camp-fre wearing his bridle where, the crupper ought to be. In fact, that was the chief fault we found with him—his insane desire to be helpful in matters where his ignorance only complicated the difficulty. He would have offered to help John drive up the horses, or have volunieered to assist Jove in governing the Universe, with as imperturbable good nature and as cheerful an alacrity in the one case as in the other, And yet he

could not fairly be called a boaster. His offers of help seemed to come rather from an overplus of good nature and a desire to please than from a vain confidence in his own powers. In fact, like some authors, he seemed to mistake inclination for ability, and to recognize no difference between the wish to do and the power to perform.

His chief delight in life seemed to be to do that which every one clse shunned, and he fairly revelled in camp drudgery. The more and the dirtier the dishes to be washed, the happier he. What a wary trout is to the angler, or a bottle of rure old wine to the bon vivant, was a greasy old pot to Skillets. (In justice to outselves, I must say that we very seldom balked him in his wild career of pleasure, but generously left him unmolested in his unbridled pursuit of luxury).

Within certain lines of limitation, Skillets was no mean cook.

balked him in his wild career of pleasure, but generously left him unmolested in his unbridled pursuit of luxury).

Within certain lines of limitation, Skillets was no mean cook.

The finer achievements of bread flapjacks, noodles, or crullers were, indeed, beyond his reach, but he could broil a venison steak, fry potatoes, or toast bacon, equal to Soyer or Blot. He had a wild theory, however, that coffee and tea were improved by mixing, and many a nauseous dose we swallowed in consequence. Once, in a moment of misbegotten enthusiasm, he essayed a pot of head cheese, but a misuse of ginger, where pepper was meant, and too great a zeal in the matter of curry powder, rather marred the general symmetry of the composition. It was not wasted, however, as he heroically morified the flesh by eating the last scrap, though evidently sympalizing with the feelings of the chap who "coul eat croy, but didn't hanker after it."

Like all truly great men, he disdained the trivialities of the toilet, and thought once a year often enough for hair-combing and general ablution.

He regarded with contemptuous pity, the care which Didaskalos bestowed upon his teeth and finger nails, and wondered "wu'n thunder a grown man wanted ter waste his time in sech triflin' ways ex them air." Stockings he contemned; "plains socks," anglicé, a cotton cloth wrapped around the foot, were aristocratic enough for him.

He had no moek delicacy, and was always ready to enlighten our ignorance from his own stores of knowledge. With that true mod-sity, however, which leads all great wits to father their best bon mots upon others, he always referred to a certain "Dooley" as his authority, and his mildly deprecatory cough, and apologetic murmur of "Dooley wuz a tellin' me," would have disarmed the severest critic. Whether this Doole, was a real historic personage, or only a mythus, like the Greek chorus, or the modern "They say," was a question never satisfactorily settled. We leaned, however, to the opinion that he was a creation of Skillets' own magnan

phosed into a "he-grizzly," and the foxes into "ki-yotes," Delilah was "one of them yar Spanish moharries," and "old man Filly-Stine's cara grandy," took the place of the Temple of Gaza.

Of anything in the shape of wit or humor he had absolutely no appreciation, and the sharpest retore glanced off his pachydermatous hide, like the bolts of the Merrimae from the iron shell of the Honitor. The most wildly extravagant numers' yarns were received by him with an unquestioning faith that in this age of general skepticism was truly sublime. In him the nil webuirari had reached its highest point of development, and stories of bears that would weigh 5,000lbs., and rifles that would kill at a point blank of two miles, met from him with a ready eredence that would have shamed a five year old child.

Only once did his faith seem to be shaken, and that was when Didaskalos, who had tracked the white bear to his polar home, spoke of the long arctic night, and of the sun invisible for months; then, indeed, he staggered for a moment, but soon recovered his mental equilibrium, and, on the authority of Dooley, proceeded to crush Didaskalos with an account of some tropical country where the sun never shone, and all the light was furnished by a lugge "dimun mounting," which lit the country for leagues around.

Singular to relate, he had no bad habits—neither chewed, smoked, drank, nor swore, and, if he lied, it was totally without malice prepense. How far he believed his own stories, we could never decide. For all that his impassive countenance revealed, he might have been a cynic playing upon the credulity of a lot of fools whom he secretly despised, or a poet, to whom the creations of his own fancy had all the semblance of reality, or a grown-up child, whose mind had not yet awakened to any realizing sense of the difference between the True and the False.

He disappeared from among us as mysteriously as he came. Left one day in charge of the camp while the rest of us were out hunting, he was missing when we returned, nor, so far

superinduced by a reflex automatic movement of the primordial ganglionic nerve-centres, consequent upon a peristaltic hyperemia of the peripheral nucleoli of Corticelli's vasella oblongata. As we none of us felt inclined to dispute so plain a proposition, we all agreed that such was undoubtedly the case.

Peace be with thy wandering footsteps, O Skillets, wherever thou dost roam! Not unforgotten shalt thou be, thou queer compound of picturesque ugliness and shambling awkardness, of asinine stupidity and bovine meekness, of humble confidence and statuseque unveracity, of childlike faith and agnostic skepticism! If living, may thy lines fall in pleasant places—if dead—

Green be the turf above thee.

Green be the furf above thee Friend of my hunting days!
Who met with none to love thee,
And fewer still to praise,

П. Р. U.

REMINISCENCÉS OF CAMP LIFE.

Some book are lies frae and to and some book are less trace and to ead,
And some great lies were nover penned.
E'en ministers, they has been kenned
in holy rapture.
A rousing whid, at times to vend
And neil't wi' Scripture.
But this that I am gaun to fell,

Which some time on a hunt befel, Is just as true as—whisky'l sell, (or some other articles)

But this that I am gaun to fell.

Which some time on a hunt befel.

Is just as true as—whisky I sell, (or some other articles).

IN a former communication I related an incident, connected with the distance I had killed a large buck, and the dubitative remark of my old friend, Kinchen K., when he saw the number of shot holes in the body, so soon as he had finished the act of decorfication. I did not tell how willingly Jim Marshall, a "newey" in the venatorial art, had taken held of one end of the pole when the deer was carried to the road, and how reluctantly he bare it upon his shoulder before he had struggled with the load many yards, and the elegant attitudes which he presented as he proceeded on his fortuous way. But during the same hunt the aforesaid Jeems afforded his companions no little amusement by his peculiar, and to them original, methods of securing his game. On the o.ca. sion to which I refer, he had been stationed at the corner of an old field which borders upon the highway. Another "stander" was placed a few hundred yards off, who soon saw a doe and two fawns run from the head of a branch and stop on the hill beyond the easy range of his gun. The broadside was, however, too tempting for resistance, and, elevating his gan about a foot above the shoulders, he discharged one barvel in the forlorn hope that one shot might take effect. All the deer bounded off, though the doe showed some little signs that she had been hit. Their flight was in the line of Jeems, and soon both barrels of his gan were heard in rapid succession, and shortly thereafter his triumphant voice in repeated yells. On our way to him we followed the track of the deer, and soon discovered blood. When we reached him his hat was off, his face flushed with excitement, his hands bloody, and he was sitting down on the carcass of one of the fawns in a state of physical exhaustion. Where his gun was he did not know, but supposed it was somewhere on the field of battle. He told us he had killed one and badly wounded another, but whether th

mildly suggested to him that among hunters the muzzle was regarded as the only legitimate end of the gun for use, and the breech was intended to be applied solely to the shoulder of the sportsman; but a greenhorn, as he was, was probably suffering from the disease called the "buck ager," and was excusable for the application of the most effective part of his weapon, whatever that might be. He was advised that in the future a mere bludgeou would answer his purposes equally well with a gua, and if, unfortunately, it should break while he was pommeling a deer he could cut another without expense. Since then our deer hunters call the stock of a gun Jeems Marshall's weepon.

It is almost useless to say that he shot only at one of the deer, and even the wounded doe escaped.

We also often had with us another character, whom we called Mud, from a faint resemblance of the appellation to his real name. He was lucky in getting shots, but extremely unlucky in getting meat. One day it was my misfortune to place the standers. Mud, well knowing that I was acquainted with the runs, begged that I put him on a good stand, for he was very anxious to kill a deer. I agreed to do so, and accordingly located him where I thought he would be apt to get a chance; and after this took my position about one hundred and twenty-five yards off. It was open pine land. Not many minutes passed before I heard the dogs in full cry, and then saw four deer heading toward Mud. They passed about twenty yards from him, and were harmlessly saluted by both barrels. When I went up and asked what was the matter, he very slowly and with measured words told me that he was never cooler in his life, had exact aim on each one of the deer he had shot at, and could not account for the miss, except that his gun was worthless. He trembled even while he was never cooler in his life, had exact aim on each one of the deer he had shot at, and could not account for the miss, except that his gun was morthless. He trembled even while he was never cooler in his life, had

. Well, I didn't see but two.

"No, surely not," said 1, "but there were four and not two."

"Well, I didn't see but two."

It was no wonder that such vision failed to do anything. After that we generally managed to place Mud where no deer had been known to run, but somehow or other, they seemed to know where there was no danger, and he shot a good deal, never disappointing their expectation but once, when by the purest accident one happened to kill a fawn. It is but just to say that of very late years he has greatly improved, and would be an excellent hunter, except that he is never ready when others are—the last to get up in the morning, the last to wash his face and eat his breakfast. With these drawbacks, he is a capital fellow, though somewhat unfortunate in the structure and delicacy of his olfactory organs.

On one occasion (it was only hast year), Teccel, Mud and I went up to Cleveland county to take a bird hunt. We had been assured by the proprietor of a white sulphur spring that game was abundant, and we could get ample accommodations, in all respects, at his house. In the latter respect we got everything we could desire and at a nominal charge. Birds, however, were not very numerous though in the three days we dovoted to it we got nearly one hundred and lifty, and had a pleasant time generally. Teccel and I occupied one room with two beds, while Mud was put in an adjoining one, which opened into ours. We used sulphur water for our morning after T, and I had been up for some time, and dressed, fully ready for breakfast, Mud was still in bed. We "hollered" at him repeatedly before he waked, and as he got out, he commenced snorting his displeasure at not only being unseasonably aroused from his downy couch, but at "a mean and low-lived trick which had been up for some time, and dressed, fully ready for breakfast, Mud was still in bed. We "hollered" at him repeatedly before he waked, and as he got out, he commenced snorting his displeasure at not only being unseasonably aroused from his downy couch, but at "a mean and low-lived trick

hobody has done anything to you—but it is your nature to complain—what are you fussing about?" "You know what you did," said Mud, "and it was mean—you burnt matches you did," said Mud, "and it was mean—you burnt matches in my room, and nobody but you would lave served mesuch a sorry trick," As he made the last remark, he dipped his hands in the basin, leaned his face over, and brought a double-handful of the odorous water up to his nose. He suddenly stopped, turned round and said, "T., I beg your pardon—it was this stinking water that I smelt." And we enjoyed the confession

as sorry trick. As he made the has remain, he depression hands in the basin, leaned his face over, and brought a double-handful of the odorous water up to his nose. He suddenly stopped, turned round and said, "T., I beg your pardon—it was this stinking water that I smelt." And we enjoyed the confession.

In many of our hunting excursious we had the pleasant companiouship of a gentleman named Hare. He was an eager sportsman, but often so excitable that he scarcely know where he shot, whether his gun was pointing at the ground or at the treetops, but would always aver that his aim was perfect. On a certain day Hare was placed near the head of a branch while the drivers hunted it and some bordering thickets—a capital lying ground for deer. Another stander occupied a position about one hundred yards to his right. It so happened that the deer which were started (two does) attempted to pass out on the extreme right of the line, but winding some one of the hunters, made a tack and ran not far from the nearest neighbor of Hare. Coming unexpectedly, he fired one barrel only, when they got out of sight, going directly for Hare. The warning was given him, and pretty soon both barrels of his gun were heard and then the lusty halloo which generally followed a successful shot. When we got to him he was wild with excitement, declaring that he had killed one and badly wounded the other. Surectony, one of them lay there stretched upon the ground. The person who made the shot just before Hare fired, at the left side, while H. shot at the right, believing that it was probable, at least, that his gun might have done the work, he asked H. where he hit the deer. "In the head, of course," said he, "don't you see the blood running from her mouth and nose?" On examination, as she was lying, no wound was visible, but the "party of the first part," had gone back on the track and fully sixty yards before the deer reached H. "fresh blood gouts met the view," and he returned claiming the game. She was turned over and a shot hole on the left

to the crest of the ridge spoken of, riscator being placed at what was called then, and is now, "the gap of the mountain."

In a short while the music of the dogs was heard. It was evident that the deer would pass beyond the standers. To my surprise, however, I heard Piscator "let off" both of his burrels. As he was only a short distance from me, I went to him, and so soon as he saw me he commenced abusing the gru, and declared that if he had had his own he would have killed two deer, as he had one of the best chances of his life. He stated, however, that he had badly wounded one. I told him that the gru was at least of some value, and he had better let me load it, especially as the dogs were still in full cry after a different deer. He said I might if I chose, but he would as lief have no gun at all. I did load it, and handed it to him. He went on, tracking his wounded deer by the blood. The dogs now approached us rapidly, and very soon I heard Piscator yell, "Look out?" and instantly his gun fired. It was but a few minutes before we heard the deer, and then we prosecuted our search for the wounded one. The place where it fell was soon found, but a deer thief land just been ahead of us, and the "caption and conversion" to his own uses were made. He (the thief) came to us with the "damned spots" of his guilt on his shirt, alleging that he had killed one the day before. But the color betaryed him. We then went to "the gap," and put the dogs on the trail of the one which Piscator said he missed. It was found dead at the foot of the hill, about two hundred yards off. So, with worthless gun, and at the same "stand," and within ten minutes. Piscator had killed three deer—a feat which is rarely achieved. When we went to divide the spoils, the thief of one whole deer actually demanded and got his share of the other two!

A Splendid the same "statement of the Mutual

A Splendrd Showing .- The statement of the Mutual Life Insurance Company of New York, F. S. Winston, President, published elsewhere, shows that the old and reliable company is in a stronger and more flourishing condition than ever before. Its assets amount to \$94,702,937,02, and its surplus, reckoned at New York rate of four and one-half per cent. interest, to over \$12,000,000. We believe that no life insurance company in the world can show figures equal to these. The whole history of the company, in fact, shows that it is managed by careful and conservative, yet shrewd men of business. Mr. Charles H. Raymond, who is so well known to all our readers as a thorough sportsman, and a lover of good dogs, is the general agent of the Mutual Company for New York city, Long Island and Staten Island, and those who are interested in life insurance can find him at 141 Broadway, or by letter at P. O. Box 37, New York city. Life Insurance Company of New York, F. S. Winston, Pre-

AR-KAN-SAW.

AR-KAN-SAW.

THE notes that I have sent you from time to time from this vicinity have resulted in a great many letters of inquiry, reaching me in one way and another from nearly cerey state in the Union. As it is impossible for me to answer these personally in detail, I ask the privilege of answering them generally in Forders and Stream.

As for the inquiries asking information about this as a gine region, I have considered it as the duty of a fellow-sportsman to answer them as fully as in my power by the first mail. But there are but a very small portion of those received. The letters that I cannot answer personally are those referring to the cost of lands, quality of the soil, its productions, health and climate. Lands in the peninsual lying between the mouths of the Arkansas and White tivers, comprising the prairie region of the State of Arkansas, are very cheap. There are in the counties of Arkansas, are very cheap. There are in the counties of Arkansas, are very cheap. The rare in the counties of Arkansas has also in this region a vast amount of lands forfeited to the State for taxes, Agricultural College lands and military lands, among which are the very best agricultural lands in the region, and overflowed and swamp lands. These State lands of all kinds are for sale in any quantity by the State, at prices ranging from fifty cents to one dollar per acre. The State "donates" 160 acres of any of her lands to actual settlers who will make certain specified improvements, or reside on the same. The title given by the State to the "forfeited" lands, i. e., those forfeited to the State for taxes, are necessarily in the form of tax titles, or quit claim deeds. Such a title, when it is good, is the best in the world. But these titles are in some instances not good; therefore, a stranger coming here should be very careful in looking up the title of any land before purchasing. He should also be somewhat careful when buying United States Government lands, for there is a shadow of conflict in the title to a large amou

my life in limins, I am connuctiff that, with proper citiva-tion and enriching of the soil, excellent crops of cotion and corn could be made, and I have also observed the proof that this is a fact here. Now do not ask me, please, why corn will not make a crop here on this fine, rich-looking prairie soil, because I cannot tell. I can only assure you positively soil, because I that it will not.

will not make a crop here on this fine, rich-looking prairie soil, because I cannot tell. I can only assure you positively that it will not.

This is pre-eminently a profitable stock region. There is no region on this continent where stock can be grown with less care for feed and shelter than right here, or where they would be less reduced by a rigorous climate. We have none of the "northers," and very seldom any of the destructive drouths of Texas, New Mexico, Colorado and Kansas. The country is adapted to all kinds of stock growing. Now, don't understand me as meaning the fattening of stock for the butcher, but rather the raising of stock to be sent North to be "corned" for fine beef, although our grass-fed beef is as good as can be produced anywhere.

At the present time nothing can be marketed from here with profit for the want of shipping facilities, except stock and cotton, but as soon as the country is opened up by railroads, two of which are now building through the county, we will have markets for every kind of crops and products, and it will be the early fruit and vegetable garden of the West. Our prairies give a good crop of excellent hay, which will go to New Orleans and the South by tens of thousands of car loads. There will be a market for our magnificent timber and everything else. As a dairy region it is unsurpassed on the continent. At least the country is good enough for me, a central fillnions man, born and raised.

In health it is about the same as the richer portions of the Western States. With the same care, houses and food, I would give this the preference.

Society is yet to be formed. What people there are here are law-shiding, hospitable and welcome strangers. Politics do not cut a prominent figure; the disease is neither chronic nor dangerous. The climate may be said to be one of the very best. The summers are long, of course, but the heat is no greater than at the North. The best half of winter is generally very wet, but the ground never freezes, therefore the work of the farm can go

Work of the farm can go on all winter, except when a raining.

The best routes to come here are: From St. Louis take the St. Louis, Iron Mountain & Southern Railroad to Newport, on White River; thence by White River packets here, or from St. Louis or Cincinnati, boat or rail to Memphis, thence by White River packets here.

I shall leave here in two weeks to settle up my business in Illinois, and return here June 1, permanently. In the meantime my friend Col. Charles II. Bellknap, U. S. Com., St. Charles, twelve miles below here on White River, will with pleasure answer all inquiries (in reason) concerning this region. Col. Bellknap is a resident here for nearly forty years, and knows the whole country.

CROCKETT'S BLUFF, Arkansas Co., Ark.

A Large Ruffed Grouse.—The Conneautville (Pa.) Courier of Dec. 9, 1881, says: "Mr. Geo. W. Brown on Monday shot a pheasant weighing thirty-three ounces. As an ordinary pheasant weighs about twenty ounces, and the heaviest recorded in the sporting journals, is 32½ ounces, Mr. Brown leads the record in the United States.

Matural History.

THE FAUNA OF SPIRIT LAKE.

THE FAUNA OF SPIRIT LAKE.

THIS country has been emphatically a game region, even since your correspondent came here. There wave once buffalo and elk all over these beautiful prairies. The buffalo were scarce, it is true, sixteen years ago, but there were large herds; but now they have passed away and are seen no more. This was a trapper's paradise. Ofter, beaver, mink, badger, fox, wolf and muskrat were here in great plenty; even now these animals are quite abundant in some seasons, except the beaver, of which a very few are caught each year, and of otter none. Foxes are very plenty; also prairie wolves, and annually a few deer are shot. Rabbits (hares properly) are in great plenty, and occasionally a jack rabbit is seen. A few Canada lynxes are here, but they are rare; four have been killed here since I came. The furbearing animals bring quite a revenue yet, and they will continue plenty for a long time yet. There are no squirrels except the red and striped and the gray ground squirrel. Gophers are plenty. There are no poisonous snakes of any kind here, although they are in the country all around us at a distance of from fifteen to fifty miles. There is not a water snake in all those lakes, which is somewhat singular. There are common striped snakes here and one or two other harmless kinds.

are plenty. There are no poisonous suakes of any kind here, although they are in the country all around us at a distance of from fifteen to fifty miles. There is not a water snake in all these lakes, which is somewhat singular. There are common striped snakes here and one or two other harmless kinds. Of birds we have a very large variety, especially aquatic fowl—swans, Canada geese, pelicans, cranes, herons, ducks, such as mallard, widgeon, teal, pintail, spoonbill and wood-duck, which all nest here. Then we have as flight birds the savbill, canvas-back, redhead, bluebill and bronze duck, and many other different kinds; with occasionally a snow goose, and lots of cormorants and loons (great American divers). The great white crane and its congenor, the sandhill crane, both nest here, as well as the loon, cormorant, swan and Canada goose. There are prairie chickens without numbering, a few quail, and waders of all sorts, from the yellowleg down to the peetweet. We have the great blue heron, the plumed or knight heron, the green-legged heron and a smaller variety—the libis, etc.; mud-hens and divers in great quantities; bald eagles, hawks, owls are in plenty, and in, winter the great snowy owl. Of the smaller varieties of birds we have nearly all that you have in the East, and some that you do not, notably the yellow-headed blackbird. During the fall we have in considerable numbers the jack snipe, the curlew of several kinds, the sickle-bill and the sora, some seasons in considerable numbers. This comprises in the main the various varieties of game in this section, and of these most are in goodly numbers.

A number of years ago I caught two white muskrats, real albinos. The fur was of a creamy white, while the nose,

seasons in considerable numbers. This comprises in the main the various varieties of game in this section, and of these most are in goodly numbers.

A number of years ago I caught two white muskrats, real albinos. The fur was of a creamy white, while the nose, tail and feet were pure white, so much so that one could see the pink veins through the skin. We have a species of fox called here by the trappers the "swift." It is only about one half or two-thirds the size of the common fox, and is generally of a lighter color. It is very active and cunning.

A year ago last summer a party of sportsmen were out hunting chickens, when one of the party came on to a deer. He banged away with both barrels with No. 8 shot, and in some unaccountable way broke a hind leg, and then all the party chased that poor deer, headed him this way and that, and finally got him. You ought to have seen that crowd when they came in. They were a proud set. A bag of fifty chickens in a day's shoot is not considered a large one here, and it is a wonder that we have any of these birds left. They are easily shot if a person does not shoot too quick, for at first they fly irregularly, but when about the correct distance for a good shot they settle down to business and fly as "straight as an arrow. Then it is nothing to bring them down.

Mallards nest here in great numbers; so do teal, and I have known boys to bring in dozens of eggs after a day's hunt. Geese nest here in all the sloughs, unless too close to man. They invariably build on muskrat houses. They commence very early. I have found their eggs before the ice was all out of the sloughs, in fact they sometimes freeze. I once saw an old goose on a "rat house." She was watching me as I came nearer (I had a boat). She grew very uneasy and finally left. I ran the boat up to the house, got out and commenced to look for her nest. No nest there, not even the sign of one. I then began to uncover the top of the house, and lo! there were the eggs. How that goose could cover those eggs and have the s

and until one gives up. They are strictly monogamous and in that respect their example might be followed by some other bipeds with profit.

Swan are of a more peacable disposition; they are very retired and quiet, scarcely ever making a noise, and then only when in flight. Their note is somewhat peculiar and very pleasant to the car. They nest in very retired places, and generally at some distance from the shore. The sandhill crane nests here on "rat houses" entirely. I never saw a nest anywhere else. It is generally from two to four rods from the shore of some small lake or slough. The young are spunky little fellows, and will fight anything or anybody, even among themselves. Unless one is very careful they are hard to find, as the old birds are very cunning and will mislead a watcher, unless he is pretty sharp. They are rather good eating, but dry. The white crane is similar in its habits. The great blue heron nests on the highest trees it can find, and if not disturbed, and the trees are sufficient, the herons are gregarious, having a number of nests in the same tree. Their young are rarely seen. They live on fish, frogs, and snakes, and consequently are not fit to eat.

The loon (spotted), nests here, and the man who finds a nest will find what thousands of old trappers and hunters never saw, for the very good reason that they can never find it. The loons deposit their eggs in a slight excavation made in a bog on the very edge of the water and not conceated. The very carelessness of their way causes the hunter to overlook it. Their eggs are very long, very hard and of a very peculiar color. The cormorant builds its nest in trees. The nest is very frail, and if a person stands under it be can see the egg through the interstices. Large numbers of nests are built on one tree, but if trees are not to be had they will build on bushes and even on the ground. Their eggs are somewhat long and quite rough and of a bluish white. These birds, both varicties, live almost exclusively on fish and are not edible. The bran

nest here, neither do the pelicans, although great numbers of the last named are frequently seen performing their beautiful evolutions high in air, or resting on some long point jutting away out into the water. They are easily killed if one can get near enough, for they are very wary, shy, and hard to approach. The baild eagles nest here, around the lakes, but the reckless bunter has about destroyed them, which is a species of vandalism, for no matter what these birds may do elsewhere, they do no harm here, and it is a grand sight to see this noble bird slowly passing across from shore to shore, or expanding his magnificent wings in ærial circumvolations. The fish hawk is seen here but very seldom, and does not make his home here, which is somewhat curious, for one would naturally suppose that this would be just the place for him. I have noticed that around lakes where water snakes were plenty, fish hawks were so also; if there is any reason why, somebody else may explain.

I do not think the canvas back or redhead ducks nest here, although an old trapper once told me he was satisfied they did. They are here in considerable numbers in the fall and I think are increasing, but do not imagine they are as good for the table as they are in the Chesapeake waters. They are fair eating, but that highly prized flavor is wanting. Sometimes quite large bags of these noble ducks are made here. Toward fall ducks begin to come into the lake from the surrounding sloughs, and a mixed set they are, I once crawled upon a lot sunning themselves on a sand bar, and shot nine at one shot, and found I had got seven different kinds.

Of game fish we have in plenty bass, pike (walleye), picknest here, neither do the pelicans, although great numbers of

crawled upon a lot sunning themselves on a sand bar, and shot nine at one shot, and found I had got seven different kinds.

Of game fish we have in plenty bass, pike (walleye), pickerel, eat, perch, rock bass, croppy, etc. Of other kinds we have buffalo and suckers, the first in immense numbers; suckers are rarely if ever seen here except in running time. A catch of from fifty to seventy walleyes in a day is not uncommon, and added to these some pickerel, bass and perch. The bass are very vigorous and afford grand sport, and will weigh from two to five pounds. The pike average say two and a half to three pounds, pickerel larger, cat none less than twenty pounds, and getting scarce at that; gar very plenty and very large, but afford no sport, and are not enten. Most of the fishing is done with the hook, except in winter, when they are taken principally with the spear. We have in the hakes East Okoboji, Gar, West Okoboji, and Spirit, a shore line of some sixty miles; and fishing is good most anywhere, though of course some places are better than others. Besides we have quite a number of other lakes near, in nearly all good fishing, and there are some lakes here that have never been fished, or at least but very little.

In the space of twenty-five square miles there are probably nearly one hundred lakes, all affording excellent sport, both for the gun and rod. The people are very sociable and willing to render information when required. We have hotel accommodations, but they are at present somewhat limited, but great efforts are being made to be ready for the summer. About as good a way as any for tourists, is to bring tents and hammocks and pitch them near the "Lodge," so called here, so that you can get your meals there. There are plenty of nice cool groves all around, where one can tent in comfort and get meals at the house. The waters are very good for bathing, being generally sand bottom, smooth and fine. This country is an undulating prairie, eighteen hundred feet above the Gulf of Mexico; in fact we are on

RED-HEADED WOODPECKERS.

RED-HEADED WOODPECKERS.

A FRIEND writing from Waukesha, Wis., twenty miles from Milwaukee, on the 13th inst., says: "We are having very mild weather now—no snow or rain, and the mercury to-day stands at about 60 degrees; it runs from 40 to 50 degrees daily. We do not know what to make of it, but fear we shall have to pay for it later. The birds have already returned, pigeons, ducks, robins, quali, biubebrids, etc. The rel-headed woodpeckers that were so plenty in the fall laying up acorns, can be seen any day hopping and flying about the trees. Last year at this time the snow was four or five feet deep, and we were almost banked in by it until near the 1st of April, with the thermometer below zero much of the time. This winter has been a very good one for game and we may expect good hunting next fall. There were some squirrels about and they have wintered well and now have plenty of acorns under their noses from the abundant crop of last season. Rabbits and ruffed grouse are as usual plenty, and all game is doing finely. Indeed, everything around reminds me more of spring than of winter."

The residence of the above writer is situated amid a clump of stately old oaks, which abound in acorns annually. In the dead parts of these trees the woodpeckers colonize quite extensively each year. That they store up their food in the acorn season is well known, but I was greatly astonished last fall while for hours I sat in the door of my friend's house and watched the movements of these happy creatures. My astonishment was caused by the great dexterity with which they picked the acorns from the delicate waving branches, and then quickly fiew to some old tree with rough bark and crevices, in which they stowed them away. This operation they continually repeated, and I believe they thus laid up many quarts a day. But there was another thing which puzzled me greatly, nor could I satisfactority account for it. I have often thought of it since, and perhaps some one can enlighten me. I will state the case. There was one odd mal

out to walk, day by day. Who knows? Everything I observed seemed to indicate equal amusement to both birds. I think the old one was preparing its young for its coming

think the old one was preparing its young for its coming flight to the South.

Bince writing the above my attention has been called to a note in Forrest and Strream, p. 47, of Feb. 16, 1883, which says: "In the northern countries of Europe, when the storks, after the breeding season, prepare to migrate southward as winter approaches, they make flights to test the capabilities of the young birds to accomplish the coming journey." This confirms my conclusions, and what an admirable instinct is this, which commands the older birds to prepare the weaklings for their future migration. In this the proof of Divine arrangement is clearly made manifest. H. W. MERRILL.

NEW ROCHELLE, N. Y., Feb. 17.

ENEMIES OF GAME BIRDS.

FISHKILL-ON-THE-HUDSON, Jan. 28, 1882.

Editor Forest and Stream:

Please do not understand me as intending to intimate that the only cause for the decrease of game is the depredations of the hawk, owl, etc., for I am well aware that there are many other reasons why our once well-stocked forests have become so sadly destitute of game, but I only speak from what I have seen. I have been witness to the sparrow-hawk business enough times to know his willingness and intenditing to attack, yet only a young quall but a full forests have become so sadiy destitute or game, but I only speak from what I have seen. I have been witness to the sparrow-hawk business enough times to know his willingness and intrepidity to attack not only a young quail, but a full grown ruffed grouse. This hawk is possessed of the most undaunted courage, and I have seen it attack for an arial conflict so formidable an antagonist as the goshawk. As to the increase of hawks, I only speak of those portions of this and other States in which I have hunted and fished for the past five years. Not only have I noticed the abundance of hawks, but I have often had the question asked me by the resident farmers and sportsmen if I could account for their increased numbers. An old farmer and sportsman said to me not long since: Why shouldn't the hawks be thick? They raise a brood every season. Their nests are built in the tops of the highest forest trees where they are never molested, and they are very seldom interfered with by sportsmen. A large portion of my time for the past fifteen years I have spent in the forests, and have tried by close observation to acquire some knowledge of natural history. From information received from other parts of the country, I have no doubt but the grouse tick has been the cause of much trouble, although I have never seen one on any game but the pinnated grouse, and in fact the vermin I have found on those birds may not be the same as found on the ruffed grouse, as I am not sure of ever having seen one of these ticks.

In your issue of January 12, Mr. W. Holberton quotes from a letter which I wrote him in reference to the falling off of the game about here. The birds which I mentioned in that letter as being found dead in the fields, I can only account for as having been lost from the game bag of some poacher who had caught them in a sare. If some of the so-called sporting papers would take half the interest in the protection of fish and game that the Forest And Strikehald etc.

Concerning the crow's taste for nestlings, a correspondent

I have read with much interest the communications in Forest and Stream in regard to the scarcity of ruffed grouse, and am of the opinion that all his natural enemies have not yet had their share of blame. That miserable and sneaking thief, the crow, I believe, does as much or more mischief in the destruction of young birds of the woods of all kinds than all other causes put together. They are ever watchful, ever on the alert for such tibits during the breeding season, and their addacity and daring are sometimes quite remarkable in the pusuit and obtaining of such food, an instance of which, occurring under my own observation, I will relate. My house is on the bank of a river in a city of 10,000 inhabitants, and I often watch the different birds in their flight up and down the river or upon the land on the opposite shore, half a mile distant. One day last summer at noon, while looking from my east window, I noticed a solitary I have read with much interest the communications shore, half a mile distant. One day last summer at noon, while looking from my east window, I noticed a solitary crow alight in a tree between me and the water. Now, I always make a target of these vermin when I get a chance, and was about to jump back a few steps for my breechloader, when he flew about ten rods to the house of a neighbor and gobbled up in a twinkling the entire brood of young robins occupying a nest in a tree not more than thirty feet from an open window, where my neighbor then sat reading. He witnessed the entire proceeding, and tried by shouts and gestures to frighten the crow away, but in vain. The thief and robber meant business, and, like many of his kind among bipeds, was not to be alarmed or deterred from his purpose N. by ordinary expedients.

ENEMIES OF SNAKES.

N countries where venomous snakes abound the preserva-In countries where venomous snakes abound the preservation of their enemies is a subject which deserves more attention than has yet been given to it. Here in the United States death from snake bites is of very rare occurrence, but in India, where thousands of individuals perish each year from this cause, the subject assumes a vast importance. In America raptorial birds are among the most active enemies which snakes have. The redtail hawk, red-shouldered buzzard and marsh hawk, destroy great numbers of them. All our readers will remember Audubon's superb plate of the swallow-tailed kite feeding on a black snake. Herons kill many snakes, as also do the sandhill and whooping cranes, and we recently recorded the discovery of a good-sized serpent in the crop of a ruffed grouse. Deer are said to be very fond of killing snakes, and swine are equally dangerous to this group. It is said that in many regions of the South where hogs were wild in the woods, snakes are always rare. The following remarks, taken from Good Words, are interesting:

Birds are perhaps the greatest snake-destroyers, especially certain families of them. Even small insectivorous birds will devour a tiny serpent as readily as a worm when they find one, and storks, falcons, pelicans, cranes, and some vultures are always on the lookout for this special delicacy. The secretary bird, Serpendarius reptitiorous, owes its scientific name to this habit; the cassowary and sunbittern are said to entertain a similar partiality; while peacocks are so fond of snakes that they will actually desert the home where they are fed in a district where these reptiles are plentiful. A well-known London banker purchased a small island on the west coast of Scotland some time ago; no attempt at cultivation had been made there, and it was uninhabited save by sea

birds and vipers. That the latter should have swarmed in such abundance in a situation so far north and isolated from the mainland is certainly remarkable; but there they were in force so strong that the banker found his newly acquired territory quite unavailable for the purpose he had intended it—a shooting and fishing station in summer. Acting under advice, he procured six pairs of peafowls and turned them loose on the island, which they very soon eleared of its unwelcome tenants, or at any rate reduced their numbers to such an extent that the remainder could be evicted without much danger or difficulty. Almost any bird will attack a snake of suitable size (of course it is not to be expected that a lark will swallow a boa-constrictor); and it is a curious thing that they eat veno aous or non-venomous species indiscriminately. They app. ar to first disable it by a sharp blow with the beak on the spine, then kill it by successive pecks and shakings which dislocate the vertebræ, and finally transfix the head; then gobble it down. The presence of the venom in the bird's uninjured stomach would do it no harm, but one would have supposed that the sharp fangs or broken bones projecting through the mangled skin in its passage down must sometimes cause excertations of the mucous membrane, and thus provide a means of inoculation, even if the aggressor did not get bitten in the combat. Neither accident, however, has been observed to occur by those who have repeatedly watched the operations.

Pigs are tremendous fellows for snakes, too. They, as well as peacocks, have done good service in ridding entire islands of these dangerous pests; and it is said that Mauritius was cleared of poisonous reptiles by the wild hogs which were imported there in the first instance, and have now spread over the island. A little tame silver fox, belonging to the writer, got hold of a dead whipsnake which was hung up in the shade of the veranda awaiting dissection; it was about eight feet long, but no thicker than an ordinary lead pencil, an

abandoned shortly afterward when it was discovered that he had been in the habit of stealing chickens from his birth. The mongoose is a noted serpenticide, and effects its purpose solely by the sgillity it displays in rushing in and gripping its adversary by the neck while dexterously avoiding the blow, not by any immunity from the consequences of a venomous bite which it has been supposed to enjoy, nor from the antidotal results of eating a herb or root of its own seeking, which the popular preference of mysticism to a commonplace explanation has decided ought to be—and therefore is serbe case. Mongooses have been subjected to the fangs of a serpent and have died with precisely the same unromantic train of symptoms that would manifest themselves in other animals; and have more than once been killed, while under observation, in the course of a fight with a deadly snake, in their wild state and surrounded by the vegetation among which they exist. which they exist.

SPRING NOTES.—Franklin, Milwaukee Co., Wis., Feb. 15, 82.—Large flocks of wild ducks and wild pigeons have een flying in a northwesterly direction over this place for e last two days (Feb. 12 and 13). Robins, meadow larks, great surprise of the inhabitants, the oldest of whom assert positively that those welcome heralds of spring have never heretofore been seen in this region before the 1st of March. It is very wonderful, this exceptionally early visitation.

M. J. E.

M. J. E.

Charleston, Ill., Feb. 14, 1882.

The backbone of winter is undoubtedly broken. We have had fine balmy weather since the 1st inst., except two or three days. The spring birds are here from one or two weeks earlier than last year, singing their cheerful songs. The meadow larks arrived here on the 3d inst., and also wild pigeon were flying in all directions. It is the first time that I have seen them here in the winter. Bluebirds came on the 6th, robins came on the 9th, brant, geese and ducks by the hundreds on the 11th and 12th. Douglas Nichols and John Cartright bagged nine mallard ducks on the 10th inst. W. M. E. Hart and George Hunt killed an owl four feet from tip to tip of wing, with a steel trap fastened to his leg, on the 5th inst.

The common yellow bird or goldfinch can hardly be called migratory this winter, or else they are returning north much earlier than usual. To-day a group of about twenty were found feeding in a weedy pasture, very contentedly. The males were in winter dress, the yellow upon the lower part of the neck showing a decided greenish tint. Shore larks are plentiful in the meadows, and in the woods chickadees and various woodpeckers. Shrikes, which were abundant during the snows of last winter, are now scarce, not one coming to my observation. Last winter I observed them in chase of the English sparrows.

J. QUAY.

RECAPTURE OF THE AUSTRALIAN CRESTED PARROQUET AT SING SING, N. Y.—On July 14, 1880, Rev. A. H. Gesner sent me a parroquet, which a neighbor had killed the day previous. Mr. Robert Ridgway kindly identified it for me, it being the Australian crested parroquet, (Callipsitaeus nove-hollandiae). The specimen, an adult male, was in perfect plumage, not a feather being broken. This in connection with the fact that the feet presented no callosities, would lead us to suppose that the bird had moulted since its escape, and the period of its freedom had been of some length. The bird was in good condition, its crop being distended with grass seeds, in fact, it was killed as it arose from its feeding ground. It had been seen for a week or more before its capture. Mr. Ridgway includes this specimen in the list of captured birds escaped from confinement in his "Nomencapture, Mr. Rugway menues the spectrum in his "captured birds escaped from confinement in his "clature of N. A. Birds," p. 84.—A. K. Fisher, M.D.

WILD TURKEY NOTES—Sardis, Miss.—I notice in your issue of Jan. 19, Mr. W. M. Waite, of Sparkill, N. Y., writing of wild turkeys, speaks of the "moss-head" species, and in your note at the conclusion of his letter you ask others to speak on this question. I have killed both the red-legged and "moss-head." Mr. Waite gives a good description of that shy little bird (little for a turkey.) I have often flushed them when hunting along the edge of Beaver Creek bottom, in Corrall County, Tennessee; but as soon as I would find out I was trying to call a "moss-head," I would at once give up all hopes of success, and hunt for a flock of the larger species, the red-legs. As soon as "moss-heads" were disturbed, they

would make a break for one almost impenetrable swamp running along the creek for about two miles, and varying in width from 800 yards to a mile, and unless I could got some of them cut off from this swamp I never troubled myself about them. Notwithstanding their shyness, I could now and then "get the drop" on one and bag him. While hunting one morning in the spring—"gobbling time"—I killed a young gobbler of the red-legged species that was of a very light gray, almost white, not a single black feather on it. For several years, and, in fact, up to the time of my leaving Tennessee, a very large white gobbler was often seen in the neighborhood of where I killed my gray one. It was very wild, and the hunters in that vicinity claimed that it had a "charmed life." It was familiarly known as the "old white witch turker." would make a break for one almost impenetrable swamp witch turkey.

A CAPTIVE "GREAT HORNED OWL."-Lockport. N. Y. A CAPTIVE "GIBAT HORNED OWL."—Lockport, N. Y., Feb. 15, 1882,—Last week Mr. Aber, a farmer living on the Ridge Road, brought into the city a splendid specimen of the "great horned owl" (Bubo nirginianus). Mr. Aber missed one of his turkeys and finally found its dead body. Concluding that whatever killed it would come for the remainder the next night, he placed a sted trup near it, and the next morning he found his owlship caught by one toe. Mr. Aber sold it to a gentleman for \$4, and the gentleman now has about all he can attend to in procuring as much beefsteak and chicken as "Bubo" requires to appease his appetite.—I. L. D.

REDHEADS IN THE ST. LAWRENCE.—The following is clipped from the *Telegram*: "Three redhead ducks were shot last week in the St. Lawrence below this city, says the Ogdensburg *Journal*. The redheads migrate from the Potomac to Labrador in the spring and return in the fall, stopping in the St. Lawrence bely ways, but it is a very unique. muc to Laterace in the spring and return in the fall, stopping in the St. Lawrence both ways, but it is a very unusual thing for them to remain through the winter." We should be glad to have any of our correspondents tell us whether this species ever, to their knowledge, winters on the St. Lawrence.

Game Bag and Gun.

A DEER HUNT IN OHIO.

"MANY YEARS AGO."

A WAY back in December, 1836, I had been entertaining my friend O. H. P. with some of my recent experi-ences in deer and bear hunting in that then great stratch of unbroken wilderness known as "John Brown's Tract," in

unbroken wilderness known as "John Brown's Tract," in Northern New York.

That night snow fell about six inches deep, and early the next morning my friend came to me with those bright gray eyes of his sparkling with excitement and said: "Uncle Peter (an old hunter) has just told me there are plenty of deer in Avon, especially in and near the great Tamarack Swamp, and that this snow is just right for tracking and still-hunting them."

Avon, especially in and near the great radiatack strain, and that this snow is just right for tracking and still-hunting them."

As both of us were "spilin" for a deer hunt, it was soon settled between us that we would lose no time in getting ready to start the next morning by the early stage going west, for Avon Center, Loraine County, Obio, about twenty-six miles from Cleveland. He met my only objection—that I had not been long enough in Ohio to own a rifle—by informing me that he had suspected as much, and on his way had borrowed of John R. St. John his famous old "Yeager" rifle, carrying a ball rated twenty-seven to the pound, made famous in Christmas and New Year's turkey shoots by the unering marksmanship of its skillful owner. This was enough; at 6 o'clock the next morning we boarded Capt. Sartwell's stage from the steps of the "Old Franklin House," armed and equipped for a deer hunt near Avon's big swamp.

Arriving at Avon Center about 1 o'clock, P. M., we "put up" at the only tavern in the township, known as "Fuller's Tavern." We were lucky; Fuller knew how to keep a hotel; he made it very pleasant for us, and there was that kind of warnth in his house and his heart that made us always want to "come again"

warmth in his house and his heart that made us always want to "come again"

We spent the balance of the afternoon in pumping the oldest inhabitant, learning the lay of the land, the way the roads ran, and the distance from one road to another, until a general posting up process had been achieved and an early bed time had arrived.

eral posting up process had been achieved and an early bed time had arrived.

In the morning we had further proof of Fuller's fitness to keep a hotel, on being called by him to an appetizing breakfast at five o'clock. At daylight we turned into the north woods, about two miles east of the tavern, near the centre of the great swamp, having arranged that P. should strike the swamp about a mile or so away and skirt along its margin easterly until he should strike the track of deer leaving the swamp to feed in the morning in the more open woods, and I should do the same turning westerly. After reaching the margin of the swamp I moved slowly along on my course with the utmost vigilance and caution, looking over every foot of ground before making a step, peering into every thicket, every old treetop, every cover that could shelter the form of a deer, until about a mile and a half had been traversed, when suddenly, off to my left and about twenty rods away, a large, five-pronged buck arose from his bed amid the thick branches and dry leaves of a fallen beech tree. Luckily, I saw him first, and stood as motionless as the big magnolia by my side. He may have heard me, or he may have arisen for his morning repast, as it was but a few minutes after sunrise; but not having seen me, after looking intently in every direction—as a deer only can look—he appeared satisfied, and began to feed on the shrubbery near at

utes after sunrise; but not having seeu me, after looking intently in every direction—as a deer only can look—he appeared satisfied, and began to feed on the shrubbery near at hand.

Then was my opportunity. I sank down slowly on my left knee, leveled "Old Yeager" at his heart and fired! Through the pulf of smoke a lively commotion was visible. Five deer sprang up out of that treetop, and six bounded away with their white flags hoisted—all but one. This one was a buck, and lagging behind the rest a little off their trail, heading toward the swamp, while the other five headed easterly and toward the swamp, while the other five headed easterly and toward the clearings along the stage road. Another ball was quickly rammed to its place over the powder, and I struck off on a lively Indian lope in a diagonal line toward the swamp to head him off, and as we neared each other I was just on the point of putting for him on the run when, to my great delight, he tumbled heels-over-head, a dead deer! I ran up and found him stone dead. The ball had evidently struck his heart. He was a noble, fat fellow, and his five-pronged, sharp and shapely horns were beautiful to see; and right here comes in a paradox in the life of the average sportsman; he pursues his game persistently and almost savagely, like an Indian or a greyhound; but when that agile form, with those

large gentle black eyes, lies prostrate before him, calm and silent in death, all the savage of his nature vanishes, an uncomfortable lump chokes his throat, and if no tear be shed, he turns saide for a moment regretting the fatal accuracy of his aim. Just then the sharp erack of P.'s rifle brought me suddenly to my normal condition, and in less than twenty minutes that splendid buck was dangling from a sapling out of the reach of hogs and wildcats. This is the way it was done:

of the reach of hogs and wildcats. This is the way it was stone:

With my hatchet I cut a gambrel about three feet long and stout enough to hold up the deer, run my scalping kuife through the skin at the gambrel joints, inserted the gambrel, climbed a chosen sapling that my weight could bend down easily, frimmed it, eatting off the top close to a sizable branch over which I hung the gambrel, having first estimated about the right spot and dragged the deer there before bending down the tree. The spring of the small tree would not make a quarter of the deer from the ground, so I then cut four suitable poles with crotches on the end of each, two just long enough to raise the body of the deer from the ground, and the other two of sufficient length to raise the game about four feet from the ground. I then placed the shorter crotches on either side of the sapling close to the gambrel, slanting in opposite directions and at right angles with the tree's body, then by lifting and pushing on one crotch and then the other a few times the deer was easily raised to the proper height for dressing. With the sharp scalping knife and tomahawk I opened him clear through from the hams to the throat, so the blood would escape as the entrails were removed. Then I opened him clear through from the hams to the throat, so the blood would escape as the entrails were removed. Then having fastened a sheet of white paper, or some strips of mooswood bark to a sharpened flag stick, insert it in the flesh of the ham to scare away ravens, crows and owls, then adjust the two long crotches alongside of the two short ones and by the same process raise the deer to the full height desired, but always being careful to leave the two long crotches slauting enough to brace against heavy winds that might otherwise blow them over and let the deer fall.

enough to brace against heavy winds that might otherwise blow them over and let the deer fall.

After blazing a line down to the swamp, and south of the deer so I could find him if the snow tracks should disappear, I took about that kind of a look at the noble fellow hanging there that a proud conqueror is supposed to take at his fallen foe, and started on a lively run in the direction the other five deer had taken. The tracks of the floeing deer were soon struck, and as they had been frightened it would be an hour or two before they would get over the fright enough to begin to feed. I took a smart Indian lope on their trail, and kept it up for over a mile when I came to where they appeared to have suddenly stopped. I instantly suspected cause, and on closely examining the ground I discovered a line of hair on the snow to the west of one of the tracks, and that they had all started off again with enormous bounds, and on following up the trail of the one where the hair was seen I soon found a stream of crimson visible both sides of the track, and the jumps growing shorter and shorter; soon the track of a hunter turned in on this bloody trail, and I guessed at once that my friend P. had turned back from the east, having struck or specific my gun,

astream of crimson visible both sides of the track, and the jumps growing shorter and shorter; soon the track of a hunter turned in on this bloody trail, and I guessed at once that my friend P. had turned back from the east, having struck no signs, had seen these deer after hearing my gun, had stopped throu by bleating, and had made these bloody marks with his winged messenger of death sent squarely through one of them.

Keeping along the trail I soon discovered P. with his coat off "snaking" his deer in the direction the remaining four had taken, southerly. He was stopped by a sharp Indian whoop, which he promptly answered, put on his coat, and whited for me to join him.

"Well, old boy. I see you have one down."

"Yes, a lucky shot, and a nice fat spike-horn. I heard your shot, turned to the west, was watchful and saw them first, hid behind a tree, and when they came within point-blank range stopped them, blazed away and shot this spike-horn. Come, I think we can get one or two more of them. What did you do?"

"I hung up a five-pronged buck and then hastened on in the direction of your shot. But why don't you hang up your deer? you can't hunt and drag both to advantage."

"Tried to, but couldn't hoist him up high enough to clear the hogs, which I should think, from the tracks I have seen, are pretty pleancy in these woods; so I had to drag him in or take my chances of getting a portion of him in sausage only." As that would make his chances of a taste of that deer very remote, I volunteered to help him hang him up safe, and this by our joint efforts was neatly accomplished in less than fifteen minutes. I must here say that this was my friend's first deer, and his knowledge of woodcraft, of course, quite hunck, as previously described, I took the trail of the four deer and I took a parallel line a little way ahead of him, but always keeping him in sight. We "started" them one or twice, hey seeing us first, noiviblastanding all our caution and vigilance to prevent it, running when the deer ran, and walking and

make the driver and passengers very angry. One had presence of mind to call me a d—p—l, but if they madder than I was I feel sorry for them. I knew all time why I didn't shoot. The wounded doe, finding she c not get over the high fence, ran along it to the barny jumped the low bars in front, crossed the road behind stage, went through an open narrow gate leading up to farm house, and made off at a hobbling lope toward the

jumped the low bars in front, crossed the road behind the stage, went through an open narrow gate leading up to the farm house, and made off at a hobbiling lope toward the big south woods.

After warming the gun-barrel before the fire of the farmer and drinking the proffered mug of cider and red-pepper, the ball was easily rammed home and the hunt resumed.

Having followed the wounded doe south and nearly to the South road, frequently starting her up from her crimson bed in the snow, and made several clean misses and no hit, and she leading me further and further from home, I began all sorts of strategy to either kill or turn her back toward the North road. I first tried crawling up and taking her unawares, but although she was weak from loss of blood, had one hind leg broken and making half circles in the snow, and would lie down every few minutes, yet she always took care to lie so as to see me first and be up and off before I could get in shooting range. Failing in that I tried to run her down, but although I could keep her in sight most of the time, she was too fast or I was too slow and fired to accomplish anything. Pretty soon I saw in the distance that peculiar light through the woods indicating a clearing, and I at once left the track, made a wide circle to the left, and struck the clearing first, (the deer having stopped in a trectop for rest and observation, as I afterwards found) skinted along it watching for the deer to come up or to find her track if she had attempted to cross the road. No track was found and no sight of the deer obtained, so it was clear I had headed her off and my chances brightened for a speedy capture. Cautiously zig-zagging my way to overlook all the ground, I moved northerly again, but I failed to get near enough to shoot when she started up from the tree-top, keeping behind it so I could not even make a long-range shot, but luckily, in the direction of home. Again starting on a loping gait I soon brough her in sight, and managed to keep her so most of the time, firing at her

But I did not three Lines Liberty." * *

But I did not turn my gun aside and let her run away.
On the contrary, I hardened my heart, took a good aim at her head, and the sharp report ended her life struggles for-

ever.

So intent had I been in pursuit of the game that I had not observed that the road was but a short distance away; that there were several buildings, and a great crowd of people just back of one of the buildings, which looked like a school-house. I did not know where I was; all was new and strange to me, but I was thankful to be so near some place of rest, for it was growing twilight and I was awful tired, now that the excitement was over.

Cutture a limb with a book at the large and and withing e excitement was over. Cutting a limb with a hook at the large end and withing

the excitement was over.

Cuting a limb with a hook at the large end and withing the smaller end, I hooked it in her under jaw, having slit the skin for that purpose, and dragged her to the road fence. Here, while endeavoring to get the deer over the fence, several people from that group came to my assistance, and to my surprise and delight, among them was my companion P. To my inquiries he explained that Puller's tavern was just across the road; that the gathering was the funeral services of a man that had accidentally been killed near Rocky River by falling from a load of hay and breaking his neck, and that hearing my shot, he had come over to see what it meant, and saw me dragging the deer; that he had been in about an hour and had "pulled" in the fawn he had wounded in the neck of woods, and had finally killed near the hig swamp after a hard chase, and what was better than all, had dressed him and we were to have venison for supper and breakfast.

Thus ended any first day's hunt in Ohio.

Thence on for more than twenty years my friend P, and myself, with other choice spirits joining us occasionally, kept up our annual deer hunts, until the sad hour when he accidentally lost his life on a riilroad smash-up, caused by a broken rail—"the victim of he dividend." But he lived long enough to achieve unrivaled fame as a hunter, and such a remembrance in the hearts of his friends, of his noble, generous, and unselfish character that no lapse of time can ever obliterate.

MY FIRST GOOSE.

ALSO MY LAST GOOSE; IN FACT, ALL MY GOOSE.

ALSO MY LAST GOOSE; IN FACT, ALL MY GOOSE.

IT often happens that a man's experience in some certain direction is all crowded into a very short space of time. So it was with my goose shooting. Season after season I had carried a few shells loaded for geese; but nogoose came within range, until one lucky day at the reservoir in Logan County, Ohio. It was a dull day. As Oscar would say—All natchua was too utterly serenely serene. Not a leaf stirred, and scarcely a duck. In fact the shooting was so poor that all the hoys had gone on an island, where they were killing time by shooting blue herons and "thunder pumpers," interspersed with yells at your humble subscriber, something as follows: "Come in here, you old rat, and taken little something. You can't hit allock of barns, anyway. There isn't a duck within forty miles, and you know it. You don't know enough to come in when it rains," etc., etc. Still the old rat stuck to his boat with a weather eye for the occasional mallard that flew his way—stuck to his boat, which was, fortunately, completely hidden in the best natural blind that he had ever found. Finally, far down over Steinmetz's prairie, was heard the honk! honk't so welcome to the shooter's ear—the sound that causes him to crouch and grip his gun, although he well knows the old gander's voice may be easily heard for a mile or more.

Possibly the boys on the island were a little envious of the position of the old rat, when instead of a "flock of burns," a flock of wild geese numbering probably two hundred were seen bearing down directly toward him and not over thirty yards high. Did the old rat "lay low" and keep quiet! Oh, no, I guess not; if his "tail" had been "in quart cup," it would probably have "rattled." Still the geese "bore onward, straight on, they swerved not a hair." How about the hair on the old rat. Well, probably that swerved, but his old Parker didn't. Still they came onward, two minutes, a mile and a half straight on—calculated, as a first experience, to be slightly exciting. Not a muscl often happens that a man's experience in some certain

A DOVE MEADOW.

HOW many readers of Forest and Stream there may be who see no meaning in the words "a dove meadow," I cannot tell, but I take it for granted that they are not a few. All the later, years of my own life I have spent in the immediate vicinity of two of these happy hunting grounds, and for the greater part of the time in entire and by no means blisted il ignorance of the sport right at hand. I therefore imagine that others may be interested in a sketch descriptive of a field of recreation, which, however charming must ever the sport of
that others may be interested in a sketch descriptive of a field of recreation, which, however charming, must ever partake largely of the character of a bloated monopoly. Every one who has spent any portion of the summer or early fall along the New Jersey coast knows that doves frequent the banks of all tide waters, but there are many regular visitors—yes, many who live along, and upon these waters, do not know that there are spots which are visited during the season by hundreds and thousands of these birds. How many such places there are I do not profess to know, but that there are two is a fact that I have realized through a delightful experience. It has been my privilege for many summers past to seek for health and pleasure, with rod and gun and boat,

"Down by the sea, where, with slow gliding motion, By cedar crowned bluffs and bright pebbled beaches. The Manasquan pours its broad tide to the ocean. Over white sandy bars, through wide meadow reaches."

Many a long day I have watched for the bunches of snipe when the south wind was blowing up the beaches, stalked the blue heron across the meadows, and chased the confiding willet around the clam-flats. Other long days I have floundered through the swamps and sloughs after woodcock.

made me think that I was acquainted with that river, and I knew that there was not a creek nor cove where my centreboard had not ploughed the (nud and) water. And yet these years passed without my gaining the slightest intimation of the existence of the "dove meadow."

One day, however, finding no ducks in the rice beds, I concluded to go ashore and try woodcock. Seeing an acquaintance engaged in gathering sedge along his bottom land, I sauntered that way for a little chat, as I always want to be on good terms with the owner of any property I shoot over. Just ahead of his team I saw three doves on the sod, and calling the farmer's attention to them was told; "Yes, two or three of them birds trade around here every season." I call particular attention to this remark as showing his opinion of the facts of the case, namely that as he always saw a few birds on the meadow they must belong there. I killed two of the doves, and then seated myself under a group of pines to eat my lunch. Soon two doves came to the same spot, and met the same fate. A few moments passed and a bunch of five encircled around the pines with an evident intention to light, but saw me and sheered off. By this time the idea was getting into my head that there were more doves "trading around there" than my native friend had suggested, and I prepared to receive them. Stationing my boy on one side of the grove with lustructions to signal the approach and direction of the birts! Leonocaled myself a little and—wall I inter as prepared to receive them. Stationing my boy on one side of the grove with instructions to signal the approach and direction of the birds, I concealed myself a little and—well I just enjoyed myself. Somebody has described Atlantic City on a summer Sunday as being "a cross betyeen Itades and Hoboken," and I consider shooting on a dove meadow a fair

cross between a pigeon shooting match. Long Island rules, and snipe shooting when the yellow legs are flying against a nor-wester. I am not going to give you my score, but I had birds enough for a monsterpie; nor tell of my poor shooting at times, but there was plenty of that when the frightened birds went hurtling through the tree tops "like lightning." Never mind about that, but the discovery was, that nearly all day long the doves were coming to that spot, singly, and in small bunches, never more than five in a flock.

That was my first day, but not my last. I have never visited that meadow since in the summer or early fall but the doves cume, some days, of course, more than others. There have been days when very few that came escaped, but that fact did not appear to affect the flight of the next day in the least. The birds came from long distances, always appearing in sight from one direction, directly up the river, and, unless albarued, invariably with an intention to light upon the same spot, within gusshot of that group of pines. What they came for I know not. Some say for gravel, others, for salt. If you want my opinion you can have it. Those doves are Jerseymen, from the inland counties. Every family of them have been trained in the good old Jersey habit of "going to salt water" or having a "sea day" during the summer. Not having a team of mules and a carry-all, each family of doves starts on its own hook, and makes its way to the nearest tide water. The sad fate of those who arrive to-day cannot interfere with the caravan that is coming to-morrow. They are bound to come, and I am glad of it. They furnish good report, in the shade, no tramping required; and if anybody thinks that because he can shoot down a dozen dumb dowitchers or bay birds out of a flock of fifty that come to the stools, he would be sure to make a good score on the dove meadow, let him just step over to the Morse Building and ask my friend G—bS—t, Esq., who will give his experience in that direction. But this sketch is long enough, a one office of shark faver, and neither of them available for public purposes, being closely guarded by their owners, not selfishly, but as affording a source of pleasure to their selected friends. When your venerable friend B——e, the stationer, drops into the sanctum, Mr. Editor, you may ask him to tell you how he sat on a camp-stool one day last summer and enjoyed a dove-meadow.

REMINISCENCE OF RANGELEY LAKES.

REMINISCENCE OF RANGELEY LAKES.

THIRTY-NINE years ago the coming month of March, I visited the Rangeley Lakes for the first time. The shores of the Mooselucaugintic and Cupsuctic were then an unbroken wilderness, with the exception of an opening, or small farm, on the west side of the big lake called the Oakes or Haines place; and a family by that name lived there and had quite a clearing. There was beside this not even a bough camp, and no logging or cutting of the grave old forest had been done of any amount. Moose were plenty and could be found near the lake. We went there to fish and hunt moose, camped at the old mill near the outlet of Rangeley Lake. At that time there was a good saw and grist mill standing. The fishing was good. One man could get thirty or forty per day. The fish were not large, from 11b, to 31b, was the average. We did out fishing at the bar (so called) in the narrows between Capsuctic and the big Lake, near the present Oquassac Camp.

One our histing at the bar (so cailed) in the narrows netween Capsuctic and the big Lake, near the present Oquassac Camp.

In a few days the fishing grew monotonous with some of the party, and two of them decided to go moose hunting. We had one dog and borrowed another at the place where we stopped. We had but two guns in the party, so there was no use for the third person. I took the team and carried them to the head of Cupsuctic Lake and stopped there myself to fish until their return at night. There was just crust enough to bear the dogs and make good snow-shocing. I had been busily engaged in fishing with good success perhaps an hour, when I heard sound of the dogs making the woods ring. I stood listening and soon found they were so near that I could hear something crashing along through the thickets and soon a big bull moose burst into view, making directly for me. Didn't my hair rise? I was only a boy then, and of course this was excusable, but if I had been a man, I am inclined to think the effect would have been all the same.

man, I am inclined to think the effect would have been all the same.

A big moose is not the pleasantest looking animal in the world, especially one that is chased and maddened by dogs. Neither is their countenance very reassuring at their best, to a youngster of a dozen years. But I was more scared than hurt. This huge monster had not seen me; and when he did discover me, about a dozen rods away, he was apparently as much as stopping to pass the compliments of the season. I thought at the time that of the two, ends of a moose, the tail end looked the best, as I was situated, without gun or jack knife. I am even inclined to think if I had had a gun I should not have thought to use it until he was out of range. About the time the moose turned for the shore, the dogs came on to the lake and saw the moose and then the race began. It was about nip and tuck. If anything, I thought the dogs a little ahead; I might have been mistaken; and I have not fuirly decided to this day. But as soon as the moose struck the shore where the snow was deep and the crust was sharp, the dogs were much the fastest team, and if they were ahead

fairly decided to this day. But as soon as the moose struck the shore where the snow was deep and the crust was sharp, the dogs were much the fastest team, and if they were ahead they fell back, if behind, forged ahead and began to attack his flanks. At that he fell to and began to fight the dogs and would run no further. Soon I began to gain courage (as I found the dogs were all he cared for) and went up within gunshot of the animal to examine him.

But I won't undertake to describe a maddened bull moose. I cannot do it. "They must be seen to be fully appreciated." The more I looked at the creature, the more my courage came back to me; and didn't I want a gun! I stood there and examined his the points and beauties. He was big, too, fifteen hands bigh, sure. It was nearly an hour before the hunters came up. They had never seen a moose before, and were as much excited as myself. Both had good rifles—and arranged that both should shoot together, at a point just back of the shoulder, I to give the word. They walked up to within twenty yards, took deliberate aim, I gave the word, one! two! three! both rifles cracked simultaneously. We stood a few seconds expecting to see him fall, but two bullets had no effect on him apparently. The men said they would load their guns for fear he might start and get further from the lake before he fell. When the rifles were loaded he showed no signs of giving up, so they concluded they must have missed the heart by a few inches. This time they would make sure work.

deliberate aim. I gave the word. The moose dropped in his track stone dead. Where do you suppose they hit him? We found all four of the bullets went through one hole just under the ear. It must be so, as there was not another hole in the skin. We dragged him on the lake, loaded him on our team and came to ear.

in the skin. We dragged him on the Pass, the skin. We dragged him on the Pass, the skin. Those days are passed. We don't hunt moose in Maine in that way now. Neither do we eaten the trout as we did in those times. I have shortly have never been moose-hunting since. I have visited Rangeley every year since, and have fished her waters with such varying success as falls to the lot of all anglers.

Androscoegin.

HINCKLEY HUNT GROUND MEMORIES.

the lot of all anglers.

HINCKLEY HUNT GROUND MEMORIES.

THE naturalist, Edward, gives the following account of the remarkable intelligence and sympathy of birds. "Loitering along the sands one autumn afternoon, he saw some flocks of the common tern fishing in the sea. As he wished to get a specimen of this bird he watched their movements. Presently one cenne flying toward the shore. Edward raised his gun and fired. The bird, with one wing broken, fell into the water. The report of the gun and the screams of the tern brought all the flock around it. They flew round and round their wounded companion as the tide carried it in toward the shore. Just as Edward was preparing to receive his prize, two of them took hold of the wounded bird, one at each wing, lifted him up from the water and curried him back seaward. When they had gone seven or eight yards, the first two gently dropped their burden, and two others took their place at its wings. In this way it was gradually carried off to a rock at some distance. When Edward approached this rock, the wounded bird was again carried oil in the same manner. The naturalist might easily have secured his prize by another shot, but he could not level his gun at such brave and kindly birds."

When I was a boy, in my 'teens, I lived on a farm in Ohio, and was an inveterate hunter. There was yet in the region an occasional flock of wild turkeys. A ten-acre field, perhaps a mile away and surrounded by heavy virgin forest, was a favorite resort for turkeys, and I occasionally visited it for rifle practice. One day I carefully approached the field and waited in vain for the sight of a turkey. On a very large, tall oak about 100 yards distant in the open field, were perched two of the largest variety of hawks. As it was time for me to go home I thought I would discharge my rifle at one of them, and did so, killing it dead. As it fell to the ground its mate followed it, almost ionching it in the latter half of the descent, and circling around a few feet above it, uttered a peculiar, m

drew their first and only blood on this occasion. The large game was mostly gone from that region when I lived there, nearly forty years ago, but small game was very abundant. I well remember killing thirty black and gray squirrels one forenoon. I have not been there for many years, but a daughter, while visiting there last summer, said the old people of the region told her of my rifle-shooting exploits when a boy. I had killed one's cat, another's dog, one had found his whisky bottle, which he had left on a stump in the harvest field, shattered in pieces, and one very old man remembered how a glancing bullet from my rifle had entered his house, nearly killing, but just missing the whole family; in short, they remembered every mishap and mischievous shot, but had evidently forgotten the backloads of game, and particularly the immense quantities of noxious emerous snot, but had evidently forgotten the backloads game, and particularly the immense quantities of noxic vermin, which I had exterminated. Those, my happidays, are brought vividly back every week as I read of FOREST AND STREAM through No. 16 lenses, already of number "too young."

MILTON P. PEIRCE.

Wenonah, N. J.

HOW TO KILL CROWS.

HOW TO KILL CROWS.

MOST men who know anything about the subject agree that crows should be killed. All persons, at least, who have regard for the preservation of game and song birds, count the crow among the pests which should be exterminated. But how this may be done is a question which roubles some of our correspondents. Here is one way which we have often tried with great success and can recommend. Perhaps others may tell us of equally satisfactory methods of circumventing this most eunning bird.

Our plan is this: Secure a large stuffed owl. Fasten this to a pole, and project the pole from a tree, making the owl appear to be perched upon a limb. Fasten this securely in plain sight, where any passing crow can see it. Then retire to a concealed spot, within gunshot of the lure, and wait for the crows. They will come as soon as they catch sight of the owl. Each crow must be shot when it comes within range, that the report of the gun may not frighten others away which may be coming. If frightened away a crow wild directly constitute himself a committee of one to hang around the spot and tell every other crow within five hundred miles that there is a man with a gun there. We have found that the great horned owl is the best crow decoy, although they will come to others, such as the barred owl. We have also used a stuffed hawk as a decoy, but with less success. For crow shooting we ase, in a 12-gauge gun, 3drs. of Hazrad's duck No. 3, with 1oz. No. 6 shot.

A Brooklyn correspondent sends us this account of a trip in company with Mr. Chas. Sargood, a taxidermist of that city:

y: We took the 8:10 A. M. train for Rockaway Beach, getting at Hamill's first landing and going toward Far Rock-ray. We anchored at one of the numerous haycocks on

the salt meadows, where my friend began operations. He took from his basket a nicely stuffed crow and a bullock's haslet; placing these about twenty-five yards from our hiding place, he set the crow in the attitude of feeding. We had not long to wait before five crows spied the decoy at his pretended feast, and they came circling around us, which we stopped with four well-directed shots from our breech-loaders, killing three. In fifteen or twenty minutes along came three more, which we served in the same way; and so it continued all day, we killing thirty-nine crows and five hawks. I had a good time and plenty of fun, the salt hay keeping us warm and comfortable. We went down again yesterday, but I was not so anxious this time about loading my curtridges with No. 4 shot, as the time before my friend used No. 8, and he killed the most birds. We killed twenty-one crows and seven hawks. By keeping well hid we killed the majority of these birds as they circled over our heads at a distance of not over twenty-five yards. One of the hawks we killed was a very large redtail, and he had in his crop the body of a chicken, which must have weighed considerably over a pound when alive. He had eaten it, feathers and all.

My friend Sargood has been to Rockaway about a dozen times this winter, and he has killed over two hundred crows and nearly fifty hawks. He makes skins of the crows, for which he has a ready sale during the summer.

I have read the opinions of your different correspondents in reference "to the enemics of game birds," in which crows and hawks are both classed; so I write this to show how to get vid of a number of these birds, besides having a day's fun.

EFLACTEM.

MAINE SPORTSMEN'S CONVENTION.

MAINE SPORTSMEN'S CONVENTION.

In the annual report of Commissioner of Fisheries and Game of the State of Maine, Mr. Stanley suggests that the sportsmen of Maine should take concerted action in the interest of game. The plan is a sensible one. We hope to see it carried out. That portion of Mr. Stanley's report which relates to game is given below:

"When the power of the Commissioners of Fisheries was extended to include game, no increased salary was provided for doubling the amount of work and duty, already sufficiently onerous; when the power of fish wardens was extended to game, no increased provision was made for their pay. The law dictates that the pay of fish wardens shall be fixed by the Governor and Council, provided that the sum paid all the wardens shall not exceed fifteen hundred dollars. The wardens are appointed by the Governor and Council. Not even a reference of their qualifications to the Commissioners who are to use them to enforce the laws of the department is required.

are to use them to enforce the laws of the department is required.

"There are now over sixty wardens on our list, and this provision of fifteen hundred dollars, if equally divided among them, would afford a salary of twenty-five dollars apiece. Game wardens have no salaries provided for them at all; they are expected to be sustained by enthusiam alone in game protection; to abandon home and the occupations that give bread to their families and go forth to the forest for the reward of one half the penalties they may obtain from captured and convicted law-breakers, and the soul-stirring privilege of shooting at sight any dog they may discover chasing deer.

"It is a disgrace to our State. We would suggest that a congress of sportsmen be called from all parts of the State, and that they should organize and, after a thorough discussion of the whole subject, choose a committee to draft a code of fish and game laws to be submitted to the next Legislature or enactment. The Commissioners should be left entirely unembarrassed in the matter. It is their duty to enforce such laws as the people, through their Legislature, give them, without being liable to the charge of having favored this or that enactment.

"It has been the experience of the Commissioners that."

enactment.
"It has been the experience of the Commissioners that, whenever called upon before a committee of the Legislature to favor or oppose the passage of any particular law, the defeated party has always opposed the appropriation for the Commission, and made it a matter of personal animosity against the

party has always opposed the appropriation for the Commission, and made it a matter of personal animosity against the objects of the department.

"We are always ready to give counsel and make general suggestions, but the people should give active personal protection to the fish and game of their locality, and go into the Legislature and insist upon proper protective laws where forest and stream are being impoverished by abuse.

"We cannot too forcibly impress upon our brother sportsmen the necessity of taking this matter in hand at once. Let the whole subject be discussed exhaustively. As the law now stands on our statutes, it is almost impossible to make out a case of hunting deer with dogs; there seems an inherent absurdity in laws which permit weapons for the destruction of game to be taken into our forests by purties at a season when it is unlawful to kill the game, and then expect wardens to follow up each party to discover infractions of the law.

"There are no beasts of prey in our forests that a pistol would not be an ample defence from, if ever required to be used at all. Again, why should hounds be allowed to be taken into our forests when their use is forbidden by law?

"The great money value of the fish and game to our State should make it a subject of fostering care and protective legislation. We append an item taken from a Portland paper:

"In conversation with one of the officers of one of our

should make it a subject of fostering care and protective legislation. We append an item taken from a Portland paper:

"In conversation with one of the officers of one of our banks Priday, the statement was made that few people have any idea of the amount of money left in Maine by summer visitors who visit our watering places and country resorts. He said that up to six weeks ago it was difficult for a bank in Portland to get many large bills, and the payrolls of various companies required an active "shimning round" to secure the necessary amounts in fives and tens to meet them, in addition to those of their regular customers. Since that time, however, bills have been a glut in the bank, and the deposits have included many large-sized bills. This great increase is due to the summer visitors to Maine. Their money focuses in the Portland banks, and this officer's bank four weeks ago forwarded \$60,000 in bills to New York; two weeks later \$30,000, and Friday \$50,000 more, or \$140,000 in six weeks, and this bank is but one of six in Portland.

"It is a legitimate subject to be discussed by our Legislature, as to how this important crop or product of our forests and streams can be most profitably managed for the State's interests. So soon as our trout fishery opens in the spring, all our best localities are infested by men tishing for market. We do not know what their net return may be from Boston, but there is one fact staring us in the face—that these men bring nothing into the State of value, and that every pound of trout is five dollars taken from the State. We do not believe that there is a pound of trout taken at Moosehead or Rangeley by visiting sportsmen at a less cost than five dollars per pound,

With our forests and fields it is the same with the products of game. Remember, we speak of our own sportsmen as well as our summer visitors from abroad. Maine furnishes a large number, and they spend their money freely on our field

our summer visitors from abnown analysis of the spend their money freely on our field sports.

"If the products of our forests and our inland waters can be made to yield more than one hundred fold when consumed on our own soil, than when mercilessly slaughtered under our present system, should not our Legislature protect our own State's interests, by forbidding the exportation of both our game fishes and game?

"The point to be considered is how to make the most of this great State's interest. We hope the citizens of Maine will carefully consider this question. The present killing of game for exportation is mostly in the hands of poachers, and a comparatively small and inconsiderable class at that. As at present carried on, it is of not the slightest benefit to the State. It has inevitably led to the utter destruction of the fish and game in every State where it has been permitted. The experience of other States has been that it has always bred up a class of citizens that have cost the State more for the punishment of vice and crime than they have earned toward their own support.

"It is manifest injustice to the people at large of the State, that property that belongs equally to all, and to be enjoyed by all, as a healthful diversion, should be monopolized by a small and undeserving class to the great pecuniary loss of the State at arge.

"Systematic depredations have been for several years carried to

by all, as a healthful diversion, should be monopolized by a small and undeserving class to the great pecuniary loss of the State at large.

"Systematic depredations have been for several years carried on upon our moose, during the deep snow and crust of the early spring months, by the combined operations of Maine poachers with St. Francis and other Indians from the Provinces. At a period when moose and other skins cannot be safely brought to our markets, they are exchanged for furs salable here, while the moose, deer and caribou hides are carried into New Brunswick, and from there find their way into the hands of dealers here. This was extensively carried on at the time it was unlawful to kill a moose in the State of Maine under a fine of one hundred dollars.

"Now that the protection of our game has been placed in the charge of the Fish Commissioners, we earnestly beg that means and the laws to enable us to use them, may be given us by the Legislature to summarily break up this nefarious traffic, and destroy the present school for fraud and rascality which the present wretched system of leaving our fish and game at the mercy of a small class of poachers, fosters.

"We would suggest that a law be passed placing a bounty of twenty-five cents per head upon the destruction of hawks and owls. The money value of the poultry killed by these birds will far exceed that of all the sheep killed by bears and dogs, to say nothing of the have made upon will ducks, partridges and insectivorous birds. We think that imprisonment should be added to the penalty for netting with ducks and for netting our fresh water fishes."

ment should be added to the penalty for netting wild ducks and for netting our fresh water fishes."

THAT PERENNIAL GROUSE.

Editor Forest and Stream:

As the subject of wing-shooting vs. treeing and shooting ruffed grouse on the ground is being discussed in Forest AND STIEAM, I will "rise to remark" that I shoot them on the wing, on the ground and out of trees; and consider each and all three ways sportsmanlike when done in the way that I do it. Now, boys on our side of the house, don't hold up your hands in horror and say. "Ramord," I did not suppose that you were a pot-hunter." I do not consider myself as such, but let me explain. I have no dogs to sell and do not wish to obtain a free "ad." in Fotest AND STREAM. I will not murder a ruffed grouse in any way, shape or manner; and will not kill one in any way that does not require nerve and skill to accomplish the feat. I do not wish to boast of skill, and will only say that I am a fair shot on the wing with the shotgun, and a fair shot at game with the rifle. If I start out hunting with my ten-gauge double-barrel and see a grouse on the ground, do you think that I would shoot it there? No, sir, not I; I would just as soon shoot a hen in the barnyard or a calf in the pasture—there would be just as much sport. My idea is that skill and sport are twin brothers and go hand in hand together. If I am out hunting squirrels with my little rifle and I see a grouse in a tree or on the ground, do you think that I would decapitate hum? I certainly would, if possible, and consider it as much of a feat as it is to down one on the wing in cover. And right here let me say, that when we wing shots speak of "mowing brush" to kill our birds, we do not pretend to perform anything impossible, such as cutting limbs off as large as your wrist or killing birds a mile away, and when some of our readers complain that the timber is so heavy that they cannot kill their birds on the wing and have to tree them in order to get them at all, then shoot them with a bullet, and do for decency'

on July 3, 1881, at New York, stood thirty yards from the trap and killed 99 out of 100 pigeons and dropped the other out of bounds? Yet if we tell about shooting a few grouse on the wing, there are some who do not credit a word we say, but tell us that our shooting "looks well on paper" when we kill "ten out of six," and "like to have them go in the worst places."

We will excuse "Octo's" two birds, but please let him not do it again. Has not "Look East" a few more words that he can write for us? He has hit the nail squarely on the head. "Mark West" also, has done nobly; and last, but by no means least, I will say to "Ruffed Grouse," give me your hand and we will shake on that same grand old motto, "Take no sitting shots" with a shotgun.

IRON RAMMOD. no sitting shots" with a shotgun. Somerville, Mass.

MUZZLE vs. BREECH-LOADERS.

MUZZLE vs. BREECH-LOADERS.

MANY years ago I took a Sharps carbine (23-inch barrel, I tontrived a muslin-shell cartridge that would burst about twenty yards away; and after further experiments, one that would burst about thirty yards away. I had no difficulty about preparing them so that they would burst within five or six yards after leaving the gun. I also made a rifle barrel precisely like the present "auxiliatry" barrel, except that it extended entirely through the shot barrel. Being undecided about some minor details, I went to the Sharps factory at Hartford, and had the finishing touches put on under the direction of their accomplished foreman, Mr. Lawrence. I prepared for this tiny rifle the old style linen-shell cartridge, then in use by the Sharps Company, and their regulation shape conical projectile. I also made a muzzle-loading conical projectile with square-cut or punch-point, and also a round bullet. After a large number of tests I could find no perceptible difference in accuracy or penetration between the muzzle and breech conical projectiles. On a still day, I could, and did repeatedly plant ten consecutive shots in a 10-inch target at 200 yards, and with the common, coarse army sights. With but seventeen grains weight of Hazard F. G. powder, it would drive these minute conical projectiles through six one-inch pine boards and half through the seventh. The same charge would drive the round balls through four of the boards and out of sight into the fifth. Up to about fifty yards, the round ball was no scurtiders, it was the conical, but no more so, while, at from 100 yards and upwards, the round ball was not sufficiently accurate as the conical, but no more so, while, at from 100 yards and upwards, the round ball was not sufficiently accurate for small game. Taking this combined breech-loading gun with its peculiarly prepared (home-made) cartridges, it was the best for small game of any that I ever used, and I killed more game with the same number of shots than with any other gun. I scarcely misse

In your issue of Jan. 12th, the article headed "The Rifle of the Future," attracted my attention at once, from the fact that I have made rifles and rifles-hooting a study for years, and for a long time thought just as the author of the mentioned article does, that is, that a rifle loaded at the muzzle with a bullet patched with greased linen was far superior to any breech-loading rifle, used as it should be, where accuracy is the object, will beat the muzzle-loader any breech-loader made in point about the muzzle-loader where accuracy is the object, will beat the muzzle-loader every time, at any distance, from one hundred feet to one thousand yards, or further if you like. Nothing but the proverbial zeal of a young convert could tempt me to "pitch into" an old veteran writer and sportsman like T. S. Van Dyke, but as the old saying is, "you can learn something from every fool," perhaps even a Van Dyke may get a new idea from me.

proverbial zeal of a young convert could tempt me to "pitch into" an old veteran writer and sportsman like T. S. Van Dyke, but as the old saying is, "you can learn something from every fool," perhaps even a Van Dyke may get a new idea from me.

In the article mentioned, the author lays great stress upon the fact that the bullet gets jammed out of shape in its passage from the shell into the rifling of the barrel. This trouble, with the naked or canahued bullet, and the tearing of the patch in the use of the long straight paper-patched bullet is, as he says, the cause of wild shooting in the breechloader. Now, what surprises me is, that a rifleman of the experience and ingenuity displayed by Mr. Van Dyke, should have allowed so small a matter to bother him a moment; it certainly did not me, for as soon as I found out what the trouble was, the remedy suggested itself to me at once. It is this: Have your bullet the right size and temper, and place it in the grooved barrel and not in the chamber; then, when the powder explodes, the bullet is upset, filling the grooves, and does not injure its shape in the least, and it feuves the gun in just as perfect a condition as it does the swedge, only a little shorter, and if the gun is a good one from which it is fired, you will have a bullet whose flight will be not only as true, but truer than a bullet fired from a muzzle-loader (and put down with a greased linen patch) at short range, while at long range the muzzle-loader would not stand a ghost of a chance. If Mr. Van Dyke doubts this, let him try it. Take a good Remington or Sharps, with the shells for which the gun was chambered; weigh out as much powder as the shells will hold, get every charge alike, fill the shells full, putting on a thin cut wad that will come flush with the end of the shell. Now, wipe the gun clean and dry; use no lubricator, put the patched bullet into the chamber first and then push it into place with the loaded shell. Care must be taken that the bullet is neither too large nor too small, but j

eastern New York. The first time I ever pitted it against muzzle-loading target rifles was at Copake Iron Works, N. Y., at turkeys. The distance was 100 rods; there were thirteen rifles at work on the ground, several heavier than my gun, and using telescopic sights. We took turns in shooting; twelve turkeys were killed, and my gun killed eight of them, and two of the others were killed with a little (Maynard, that being the only breech-loader on the ground except mine. I attended, among other shoots, one at Middle, too, N. Y. The prizes to be shot for were a gold watch, a telescope, and turkeys. My gun won the telescope, and five out of the seven turkeys killed; distance 160 rods. I could not get them to go in for the watch, so that was not shot for. The rifles used were all muzzle-loaders, except mine and a small Remington sporting rifle. Homer Fisher, of New York city, was there with his pet long-range muzzle-loader, and several members of a club that has its headquarters at Croton Falls, N. Y., styled, I believe, "The N. Y. State Rifle Association." They used heavy muzzle-loading telescopic-sighted rifles, and in their club contests the guns are fired from a complicated machine called a rest, that has about as much mechanism to it as an engine lathe; the gun is not held against the shoulder at all, but is brought to bear on the target by looking through the telescopic sights, and setting the gun by means of set screws; then they would rise up, watch their wind-flags, (of which each member would have from three to a dozen) and when they blew out just so far, touch the bair-trigger. Such shooting is to me a farce, but I am willing that those that like that style of shooting should enjoy it. I was at a meeting of the above mentioned club, held at Dover Plains, N. Y. I can't give the date, but it was about three years ago, when a Mr. Joseph Brinton, of Lakeville, Conn. beat their best shots ten and one-fourth inches on a thirty shot string at forty rods; he used a 15-lbs, gun of the same make as mine, loaded at

It is well known that there is a lack of uniformity in both the calibres of and the ammunition for our American made rifles. Consequently, one owning a rifle should come to no hasty conclusion as to the kind of ammunition best suited to his rifle, but must keep trying until suited, which, allow me to add, has not been the result in my case. I have a .38-cal. Whitney central-fire, using the ordinary extra long cartridge, 30-inch barrel, rilled one turn in twenty-four inches, while the bullet cast in the molds furnished with rifle is much too tight, thereby impairing its accuracy and rendering it unpleasant to use. In vainly trying to find the right bullet I have made the following discovery: That either the shell is .37, or the .38 patched for the Ballard is nearly .40 with patch, and plump .39 without. Also, the .38 Maynard is .39, while the Maynard .35 is really too large to enter the shell without trimining. Now, some one is evidently at fault either the makers of the rifle or of the ammunition. I have tried several other makes of like goods, including those of U M. C., and also W. R. A. Co., and find a difference even in these supposed standard makers. Therefore, in my case, I must get some local gunsmith to make a mold for me, in order to do satisfactory work.

Now, what we want is a standard size of either calibre; and if any is above the standard size, give it its true measurement. By using factory ammunition supposed to be all right, but proving otherwise, many a good rille has been condemned. We must not rely too much upon factory annunition, but buy the shells, either primed or otherwise, load them with the brand of powder best suited to our own case, thereby getting ammunition on which we can rely, and in a measure compelling the manufacturers to make more satisfactory goods both as regards material and size. For loading I find the lollowing rule: "Pour an even charger of powder through the loading tube, which tool overy rifleman should use, into the shell to admit the base of the bullet," "I find in It is well known that there is a lack of uniformity in both the

case."

Now, as to experience with round balls, I find 100 to the pound, or OOO shot just fit the .38-cal. shell. I load with the usual charge of Orange rifle C. G., leaving enough room for one lubricator and one-half of the ball; crimp enough to hold the ball. In adjusting sights from a fixed rest, I have grouped five balls so close that a dime would cover them at forty yards, and at thirty rods have put four consecutive balls into a space four by six inches, which is good enough for all purposes.

all purposes.
There are in this vicinity three Sharps rifles, cal. .40, rifled

one turn in twenty inches, the owners of which are using seventy balls to the pound, with very satisfactory results. It is evident that the sharp twist has nothing to do with the deflections of the ball (as "D. H. S.") infers from the reading of our Yan Dyke's letter), but from some simple cause. Either the ball D. H. S. uses is too large or too small. Let him try my plan. I have faith in it and think he will, after trying it. In giving results of experimental rifle shooting, would it not be well to give the name of rifle, calibre, weight, length, and sharpness of twist, as such data would be of benefit doubtless?

less?
Should the advice above given be of benefit or interest to any one, my object in writing will have been attained.

HOOSAC TUNNEL, Mass.

I would like to ask Mr. Van Dyke if a breech-loading rifle will not shoot steady at fifty yards, how it can do close work at 200 or 300 yards against a muzzle-loader that will shoot exact at fifty yards, if it is loaded properly and sights raised according to the distance? My experience has been that a rifle that did not shoot steady at short range would not at long range. It might make a centre shot occasionally, but that would be all chance in my estimation. I agree with Mr. Van Dyke as to the muzzle-loader being the most accurate at fifty yards, but go still further to even 300 yards, and that a patch can be made so as to load a conical ball as true from the muzzle as those set in shells for the breech-loader's use. But the query is to me, how it is that if the ball from the braech-loader gets out of exact range at fifty yards, how it gets back in range at 300 yards. I also agree with the above as to the use of round balls at short range.

F. J. GLEN'S FALLS, N. Y.

THAT WONDERFUL SHOTGUN.

PYRNE" does not wish to be discourteous, but there are

Dynke" does not wish to be discourteous, but there are world that neither he nor any one else can refer to justly without showing somewhat of discourtesy. Therefore in calling attention to the wonderful score made in "A Record of Deer Shooting" in your issue of Feb. 2, 1882, by Rev. Geo. W. Baines, Jr., of blank city, (if the reverend gentleman's city had been given I would have written directly to bim) in the Choctaw Nation, I fear that I may give personal offence to its writer. If so I cannot help it. My excuse is, and will be, that I am an industrious seeker out of facts and the best guns, and an willing to expend a good deal of time and money and to travel a good ways to get the proof of which is the best shotgut to kill deer neatly with, or even to see a gun that will perform what this Baker gun is solernally declared to have done. "Byrne" has repeatedly said that if the ten-bore three-barreled Baker gun can be bored so as to shoot buckshot reasonably well—by reasonably well I mean to kill a deer every time, so that it can be bagged or "hung up" at a distance of thirty-five measured yards without a failure—it would be a very efficient gun with which to stalk deer. But that our friend's ten-bore Baker gun, or any other ten-bore shotgun, will perform the work that the reading of Mr. Baine's note conveys to the reader, "Byrne" does not believe, and never will believe, until he sees the same kind of work done. Not that "Byrne" wishes to say bluntly that the gentleman has given us purposely an untruthful record, but that he has made a mistake in the length of the Choctaw yard, or some other way, for his note conveys the meaning explicitly that there were all the shots fired at deer not his hunt.

"Byrne" does not dispute that out of several dozens or hundreds of shots fired at deer at varying distances such effective short show. The short should be a distance of the property of the short of the deep control when he had a distance with his tracerd to go along with the gun. "Byrne" will put up the control we have

It is possible, and even probable, that I would have been beaten if we had shot, but I thought not, and my money was ready to back my belief.

"Byrne" has traveled many a mile and spent a good deal of money in visiting these men that can hit a silver dollar every time off-hand with a rifle 75 yards, but has never been so fortunate as to find one who could place ten consecutive balls at that distance in that way that could be covered with a coffeccup saucer, let alone the dollar. He is very anxious to see such a feat performed. He has put up chickens sixty-five yards for fifteen to twenty duck hunters with good chokebore duck guns to shoot at, they to load as they plensed, with the privilege of shooting so long as they wished for five cents a shot, they to have every chicken they hit hard enough so that it could be gathered if it was a duck, and the result was, that when "the boys" had fired forty-seven shots they had bagged three chickens. These chickens were placed standing on a smooth greensward, yet these same men would tell you frankly that their guns wond kill a duck, a very much harder bird to kill, "seventy-five or eighty yards every time." I write these remarks in the same spirit that "Skeptic" does on page eighteen, of the same issue, which Mr. Baine's article appears, "Old Time Pistol Shots," and your editorial remarks, "Pistol Scores." Not to make any one mad, but to try and keep sports men within the bounds of reason, even when writing fiction—and I willingly admit that I sometimes drop a little fiction into a poor hunt, to make a point, or add to its interest, but always try and keep within the bounds of reason or possibilities. Then, to sum up, if Mr. Baine made twenty to fifty shots from which these seven were chosen as examples to show the power of the gun all can believe him, and "Byron" will consider this gun nothing wonderful at all, but yet good. But if he means as his article reads, that these were seven consecutive shots, and intends to say, and seeks to make us believe, that his gun will

CROCKETT'S BLUFF, Ark.

proach.
CROCKETT'S BLUFF, ATK.

SOUTHERN ILLINOIS ASSOCIATION.—A committee of this society have issued the following call: In July, 1881, there was organized in the city of Du Quoin, an association called the "Southern Illinois Sportsmen's Association," having for its objects the securing of proper legislation for the protection of game, birds and fish during the seasons when it is improper to pursue or to kill them; the encouragement of our citizens in their efforts to increase the varieties and numbers of our game birds and fish; and the organization and encouragement of subordinate associations and clubs, for the vigorous enforcement of all laws against the killing, sale, or shipment of any such game, birds or fish. This association is composed of individual members, and not of subordinate clubs or associations. The membership fee is \$1, annual dues, \$1 (payable in advance); and members are liable to an assessment not to exceed \$1 in any one year. All well-disposed persons living in the State south of the Ohio and Mississippi Railroad, or in the tier of counties through which said road passes, are cordially invited to come out and join us, to the end that a strong organization for the protection of game, etc., may be built up in this end of the State. Our next annual meeting will be held at Mt. Vernon, Ill., on the 16th and 17th of May, 1882, when liberal prizes will be offered for proficiency in wing shooting. The association will meet in convention on the night of the 16th. The officers for the ensuing term are: Dr. J. J. Jennelle, Du Quoin, President; John Porsyth, Centralia, First Vice-President; R. G. Sylvester, Carbondale, Second Vice-President; C. P. Richards, Du Quoin, Recording and Corresponding Secretary; Don Onstott, Du Quoin, Treasurer. Board of Directors—C. A. Hobbs, Mt. Vernon, Chairman; H. M. Condit, Centralia; Sam. Hewitt, Carbondale; Dr. D. H. Parker, Cairo; C. H. St. Clair, Benton.

Centrain; Sam. Hewitt, Carbondale; Dr. D. H. Parker, Cairo; C. H. St. Clair, Benton.

Florida Notes.—New York, Feb. 19, 1882.—Having just returned from the wilds of Florida, and noticing in your last issue a message "Rice Bird" communicated, I determined to pen you a little news, mentioning a few of the friends of the Foriest and Stream and other residents of the State. My intention in visiting the South was to join the party under Dr. Henshall, who contemplated a journey around the coast, but who at present is camped somewhere near Lake Worth. All like the Doctor, and he probably knows more about Florida than any one, with the exception of say one or two. The original party who contemplated making the trip with the Doctor consisted of himself and wife, B. H. Mayor and wife, the latter, Mrs. Mayor, being a wonderful shot with either shotgun or rifle, and a great lover of nature and sport, as also is her husband, whom you know as a correspondent, and many of your readers as an enthusiast in field sports and a sure shot. Next comes C. L. Jordan, from Texas, the most ardent sportsman and expert fisherman I ever knew. John Norton, of Bristol, Conn., also joined the party, well known by a large circle of readers of the Forest and Stream as a "true sportsman" and a "staunch friend." Frank Strobar must not be forgotten, as he is a professional sailor, guide and sportsman, and I would advise anyone going to Indian River, Florida, to see him and get advice and information, which he will gladly give gratis. I have

secured the promise of all persons mentioned to give the FOREST AND STREAM a full account of their delightful trip through Southern Florida. I will some time in future give a description of some of my many wanderings and adventures in Southern Florida myself.—August Tine.

NEW HAMPSHIRE GAME LAW.—The amended game law of New Hampshire makes the open season for deer, moose and earibou from Sept. 1 to Dec. 1, and makes it penal to capture alive, as well as to kill any during close time. Gray squirrels are also protected until Sept. 1; and rabbit-shooting changed from Oct. 1 to Sept. 1, so that with the exception of woodcock, ducks and upland plover, which may be shot in August, all shooting begins Sept. 1, and there is no excuse for any one taking a gun into the woods before that time and shooting young ruffed grouse under the pretence that he is after gray squirrels.—Sam. Webber.

ANOTHER OLD GUN.—L. G. Parke, of Camden, N. J., has a revolutionary relie in the shape of a powder-horn. It was made by his grandfuther, at the age of eighteen, then a soldier in the revolutionary war, from the horn of an ox slaughtered for beef in the army. The surface is almost entirely covered with carving, among which are representations of fortifications, buildings, ships, weapons, etc., and the following inscription:

"Daniel *Parke ** his *horn; Roxbury, 1775.—18 *yr. liberty or death."

liberty or death."

The horn is evidently in just as good condition as it ever

Was.

Highland Park, Ill.—Feb. 13, 1882.—The first flock of pigeons seen by myself was a week ago, and since then they have been coming very fast. Both bluebirds and robins are here, and the Chicago markets are full of ducks and geese. I have not seen so mild weather and so much of it in February since 1864, and that was in the latter part of the month. In that year suipe were found by myself on the Illinois River, on March 4th. On two different occasions since I have been living here my dogs have treed woodchuck. Once, in a giant oak, the woodchuck only ascended to the first limb, but in the other case he took to a tree so tall and slender that two of us were unable to shake him out.—Harry Hunter.

Stender that two of us were unable to shake him out.—HARRY HUNTER.

ADIRONDACK LANDS.—Before now, we have suggested the need of action on the part of the State of New York to care for the Adirondack park, the magnificent but unappreciated property of the State—unappreciated because a gross, sordid disposition to turn it all to money fails to get satisfaction; and we are in hearty accord with an editorial of the Utica Herald's which expands a suggestion made by Governor Cornell into the advice that the Legislature put a stop to the stupid sale of Adirondack lands and set to work to save or restore the forests. Any citizen of the State, furnished with the average amount of information, is aware that no one buys a tract of Adirondack timber land save to demude it of treas and surrender it again. While money-grasping vandals may be eager to ruin this fine piece of scenery, the State of New York ought to be able to refuse the petty revenue it derives by sacrificing so much beauty and natural wealth. There is not a county in the Northern part of the State that is not pecuniarily interested in keeping the Adirondack park an attractive and delightful resort. The forest supply, science shows, is intimately associated with the amount of yearly rainfall; while, as the Herald reminds us all, "we need these waters if we are to preserve our canal system," and, of course, the lakes are dependent on the rainfall. Let the Legislature make haste to stay the destruction of the public forests.—Syraeuse Skandard.

Legislature make naste to stay the destruction of the public forests.—Syracuse Standard.

The Onto Trouble.—Wauseon, O., Feb. 16.—Editor Forest and Stream: Examine the inclosed slip, and remember that this represents the intelligence of our game law makers. The report is taken from a daily paper: "There was considerable discussion this afternoon over Mr. Patterson's bill to protect wild fowl in the State of Ohio, and providing a fine and imprisonment for any man who hunts prairie chickens, quail, duck and other birds otherwise than with the regular shoulder gun. Mr. Licey said he should vote against the bill because he did not believe in hunters roaming at large over other people's property and shooting wildly and recklessly around and destroying and maining horses, cattle, etc. Mr. Licey said that last fall some of these reckless, lawless hunters were on his premises, and seeing one of his fine heifers, remarked that it would make a fine mark to shoot at, and finally one shot at it and killed it, therefore he should vote against the bill, as he did not want hunting at all. Mr. Alexander moved to amend so as to include cows in the list of things that it would be unlawful to kill before January, 1884. The bill finally passed with a few votes against it. The bill will pass and shut us out of shooting in Ohio for two years more. Plenty of birds will be left for the cats, the hawks, foxes and pot-hunters' shooting every winter, while the sportsman, who never shoots more than he wants for himself, and never "ground mashes," will be shut out, and no more birds left in "84 than now. I am ready to give away a fine dog.—H.

TRAPPING IN ARKANSAS.—A three weeks' trip to White voters.

and no more birds left in '84 than now. I am ready to give away a fine dog.—H.

Trapping in Arkansas.—A three weeks' trip to White county, Ark., in January, did not show us as much sport and game as we anticipated. Taking passage by through express from Philadelphia, we landed at Kensett, Ark., in just forty-seven hours. The weather was unusually disagreeable, being a succession of cloudy, rainy and sleety days, so that we scarcely had half a dozen days of pleasant sunshine during our whole stay. Had not been in town two hours before we saw a dead deer brought in on a horse. It had been killed about three-quarters of a mile out of town. The very unfavorable crop year just past made almost every man turn hunter, and in consequence of which deer and all kind of game had to suffer. Our host informed us that he had no doubt but there had been from 1,500 to 2,000 deer alone shipped out of White county the present season; this may seem large, but it is probably very little exaggerated. We spent ten days camping with a party of Green county (Ohio) boys trapping on Little Red River, and in that time moved down on to White River, they had not had much success, owing partly to the scarcity of coon and mink and from the fact that there is much more trapping done of late years than formerly, and the fur-bearing animals are growing much scarcer. The better trapping is further south, even into Louisiana, but then the fur is of little value and but few spare the trouble and time of catching it. The principal fur of that section of Arkansas adjacent to Little Red River and White River, is raccoon and mink, and they both declined from 25 to 33 per cent, from last year, so that there is but little money in trapping in that part of the country.—J Lee Smedlery.

A VETERAN IN THE RANKS.—Chillicothe, O., Feb. 6, 1882.— A Veterman in the Ranks.—Chillicothe, O., Feb. 6, 1882.—Although I am about sevenity-five years of age, I have for many years been one of a party who own a tent and other camp equipage, and camp out twice a year, hunting and fielding.—I enjoy the sport as well as ever, and am much interested in your paper and feel as if I could scarcely do without it.—I am one who believes in the superiority of muzzle-loading rifles for close shooting, up to 150 yards.—H. M. P.

A BILL bass been introduced into the Connecticut Legisla-ture granting three dollars for every fox killed in the State. The Bridgeport Standard thinks that as foxes breed pretty thre grating three tonars to every the hard some pretty fast under favorable circumstances, it might not be an unprofitable business to raise them at that rate, providing it were not necessary to furnish them with poultry as a steady diet. A fair pack of foxes to start with might be made as profitable as a black walnut forest or an orange grove.

Live Jack Rabbits Wanted,—The New Jersey Game Protection Society desires to purchase some live jack rabbits to put out in New Jersey. Any information as to where they may by procured will be thankfully received by Mr. Richard T. Miller, Secretary New Jersey Game Protection Society, Camden, N. J.

Madison, Conn., Jan. 26.—Game of all kinds has been very scarce here, except squirrels, which have been more plenty than usual. Several large flocks of wild pigeons were seen here to-day, but none killed. As there were none in September, how can this flight be accounted for?—Medicus.

Rust in Guns.—Springfield, Mass., Feb. 18.—Editor Forced and Stream: To prevent rust spots keep your gun in the top story of your house and keep it clean. It is not powden but corrosion from dampness that spots the barrels. Try this and don't scold the powder men.—E. H. LATHBOP.

Hanover, Ill.—Feb. 14.—The ice has gone out of the Mississippi at this point, and a few ducks and pigeons have put in an appearance.—A. B. W.

Sea and River Hishing.

If I could live my life over again I would go a-fishing three days in

CAMP FLOTSAM.

I. CONCERNING "signs.

THE great Teacher was met on the threshold of his labors with the demand for some ocular proof of the truth of his revelation, and, in the sorrow of his heart he cried: "This is a well-expectation, they seek to time."

With the demaint or some occurar proof of the truin of his revelation, and, in the sorrow of his heart he cried: "This is an evil generation; they seek a sign."

It was not a subject for wonder. Centuries of culture had failed to efface the belief which, it would seem, was earthborn with the race, that every event, great or small, had its precursor; that to the wise, it was possible to foresee the fate of men or of kingdoms, to foreknow the issue of battle or the success of a journey. Five centuries before, the solitary hand had written upon the wall the mystic words—the "sign" that the seventy years' captivity was over. Two hundred years earlier, the shadow in the dial had gone back ten degrees, as a "sign" that the sickness of a King of Israel was not unto death, while earlier, the Chronicles recorded the defeat of a predecessor, who, in the face of adverse "signs," went to Ramoth Gilead to battle.

Within the century, a Roman Emperor had fallen under the dagger of an assassin, an event heralded, it was said, by the yavning of graves, the shrieking of ghosts, when—

Fierce fiery warriors fought upon the clouds. In ranks, and squadrons, and right form of war. Which drizzled blood upon the Capitol.

Which deizzled blood upon the Capitol.

It was a fitting retribution which, two years after, was announced by a ghostly "sign" to the chief actor as in store for him, on the morn, on the grassy slope of Philippi.

History and tradition had confirmed the belief that an event of such importance as the coming of a new kingdom, could not happen unannounced, and, it was not strange that men should inquire, what shall the "sign" of these things be?

Of the lesser "signs," omens and precursors, the literature, were it fully written, would be something enormous. It would relate to birtlis, marriages, sickness, deaths, seed time, harvest, storms, winds, his toils and sports—to almost anything which concerns man in his daily life. The philosophy of to-day has swept these notions—so far as most of the world is concerned—beyond the horizon of thought, has stored them in the old utite—the wonder room—of the race, along with the of to-day has swept these notions—so tar as most of the word is concerned—beyond the horizon of thought, has stored them in the old attic—the wonder room—of the race, along with the Cyclops, Centaurs and Chimeras of its youth, to be visited—only on anniversaries, and then to be smiled over in a sad sort of way, as something which one has outgrown, something which onee was much to a young life, as one now gazes on the rustic sled of his youth, or on the yarn ball of his boyhood, deftly covered by a mother's hands—hands which some thirty years have been dust.

"Signs"—those which brought dread of impending danger and kept one in misery, those which forced the farmer, often to his own discomfort, to "kill" or to plant when the "moon was right"—'signs" which have worked trouble and overworked people, these have been relegated to the domains of superstition and, only the harmless "signs" which 'no one believes"—those which serve to give the housewife notice of "company" or the approach of a "stranger," or warn the merry maiden that she "won't be married this year"—only these remain.

"company" or the approach of a "stranger," or warn the merry maiden that she "won't be married this year"—only these remain.

Nay, gentle angler, stop! don't speak, we are not about to wipe out your pet rules and "signs"—ours too. We said, "which no one believes," they are not the angler's "signs," for we all believe them. We could no more angle without our "signs" than a New York State lawyer could practice without "Throop's Code." They came to us redolent with the odor of English mornings, from days of Tudors and Plantaganets, when the gentle craftsman cast his line with full faith in their efficacy, and dreamed the day through along dark pools, under lenity coverts, through bright meadows, haunted by the hum of bees, while, perchance, his sterner brother was "seeking the bubble reputation," in the ranks of yeomen at distant Flodden or just beyond the hills in view, was striving "to lift one hero into glory" on the field of Barnet.

arnet.

Of the many "signs," rules and maxims pertaining to the
agler's art, the one most regarded is this—when to go
agling. We have often wondered whether, on that memor-

able day when Simon Peter said "I go a-fishing," he thought the "sign was right." The old rhyme—

When the wind is in the north The skillful fisher goes not forth. When the wind is in the east It's good for neither man nor beast,

The skillfal fisher goes not forth.

When the wind is in the east

It's good for neither man nor beast,

reminds us of the following hit of camp experience:

On a night in August last we had retired after a very indifferent day's sport, under a cheerless gray sky, with a cold wind shifting toward the northeast. We slept the sleep of the just, yet roused sufficiently at times to be sensible of a sharp patter of rain on the teut, and the soughing of a dreary wind through the trees. It had been day for two hours when a head was thrust between the tent flaps on the lee side, from without, and we were awakened by:

"Get up; get up; here is the dirtiest, nastiest morning you ever saw—just what you like."

"How is it out?"

"Cold; wet; wind northeast."

It was the voice of my old companion, "Mot S.," who, if he has a single "sign" which he holds infallible, it is one which tells him—without other message—when he is sure to find a certain tent and lone fisherman at a certain lake. He had arrived the previous night, and, I think, had hoped for better weather, but he knew it was "one of my days."

This is not the time nor place to tell of the romance of making coffee and cooking breakfast in a nor'easter. It was accomplished, however, and, to-night by the blazing anthractic, its memory hovers around us like a "love lit dream."

Well, "Mot" was right—it was nasty. A steady drift of wind and mist came from the northeast; the fog lung low on the mountain-sides above and around us, and pressed down upon the lake in spite of the wind which was lashing its surface into eddies and foam wreaths. Heavy coats, under our rubber clothing, were necessary for comfort, and with these, our rods and—Dr. H., we cry you mercy—with "wums" for our only bait, we took to our boat. We anchored off a ledge of rocks, in a depth of about six feet of water, and in a channel through a bed of grass and weeds. Here we caught the full force of the storm. Not an angler save our-selves freted the lake with his cast that day. The "sign" was wrong, accordi

found us back at camp it was with twenty-two bass, the largest of which weighed three pounds and two ounces; three weighed over two pounds each and the balance weighed over a pound each.

For the purposes of this sketch the catch might have been made to average two pounds and a half and running up to five pounds, and had "Mot" had the writing of it probably it would have been thus, but we are discoursing on "signs" and for our present purpose "a fish is a fish."

As "Mot" said, it was just what we liked for a good bass day at this particular lake. We once tried another lake on a like day with a like result. Of course we are not partial to northeast winds with rain, but for a prime day give us a lowery, misty one, with drizzing or light driving rain, with the wind in any quarter, but could we choose we would say southwest. When, however, much rain falls, the second day will usually end the fishing until it clears.

Some weeks after the above narrated experience, we learned from an ancient fisherman how "to tell by the almanac when the sign is right." We went back with the sign to our record of the day alluded to, and judge of our interest—we will not say surprise—to find that "the sign was right" for luck. This almanac "sign" was new to us, and we were gravely assured that it was "the oldest sign in the world." As it is determined by the zodiacal signs, it may be as old as astrology or Thales. At all events, our ancient cannot be prevailed on to go a-fishing when this "sign" is wrong.

We suppose this "sign" is common to most of the readers of FORRST AND STREAM, particularly to the cel and bull-head fishers, so we will not occupy space in recording it, but will repeat the sermon of the ancient Dervish to the faithful, "Let those who know tell those who don't know."

We purpose come time on a leisure day, when we can get a proper collection of Ayer's. Wright's or the Farmer's almanes, to go back with the old "sign" over the lucky days marked during ten years and see how it stood.

The kind offer by the editor of

meeting as entertaining doubts as to the efficacy of spirting on the bail, or at least as holding loose views upon that cardinal principle, he may perhaps not only weaken some brother's faith, but it may have the effect of the inquiry concerning "spiritual things," which the colored brother made of his pastor, who replied, "See yeah, brudder Jones, free such questions as dat, would upsot de hull system of freology."

Upon re-reading, however, we are convinced that the editor only intended to convey the idea that he might be obliged to eschew clams as bait.

In treating this branch of the subject, we are reminded of an incident of our boyhood. There was in the neighborhood a very expert "sign" fisherman, of small stature and weazen face, from the corners of whose mouth downward to his chin, usually extended the dry bed of a channel in which tobacco juice was wont to flow at times in torrents. Him we had often entrented, in vain, to take us fishing, for he always returned from his angling trips with a half bushel, more or less, of bullheads; these were his game fish and the delight of our boyish eyes, which scarce had seen else than minnows upon a hook.

At last, a day came when the "sign was right," and we were permitted to become the companion of one of his ex-

delight of our boysh eyes, which scarce had seen else than minnows upon a hook.

At last, a day came when the "sign was right," and we were permitted to become the companion of one of his excursions. Hooks, lines and worms were soon ready, a tramp of some two miles to a small pond made, an old leaky seow procured, the veteran and neophyte auchored, and a boy's dream was realized. It is unnecessary to state in this connection who had to half the seow at regular and frequent intervals, who, in consequence thereof, did most of the fishing, or who first became disgusted and wanted to go home, for that is not the point. The tobacco juice, which was wont to rush along its ancient bed, was projected upon the worm before each east; between each east a black flat bottle was produced and the tobacco juice properly reduced and toned, in readiness for the next east. Late in the night, tired and sore, we tramped homeward, the boy with a fingerling, the fisherman with a basket—like his bottle—empty.

We were an observant youth, and on that never-to-be-for-gotten day learned two lessons, the truth of which years of angling in salt water and in fresh, in stream and in lake, with anglers merry and saft, funny and contemplative, have con-firmed, namely: the boy who don't spit on the bait may anglers merry and sad, tunny and contemplative, have con-firmed, namely: the boy who don't spit on the bait may catch the most bullheads; and that greater one, without which the angler's life would lose half its charm and boy-hood be divested of one of its most cheerful incidents—that the soft, tender, genial side of the nature of him who angles is surely brought out. The one was learned that afternoon upon the mill pond; the other was on our return, quickly sought out by an irate parent with a strip of shingle, the re-ward of "running away to go a-fishing." WAWAYANDA.

Recent articles in your paper on "signs" have been read by me with interest, and doubtless by many others, who, like me, tish sometimes themselves. As far as the moon is conserned, it does not seem to me that that luminary exerts any more pressure on the surface of the earth at one time than not inclined to adopt the theory advanced in your issue of the 9th inst., "that earth worms come to the surface more abundantly in the dark of the moon, because the moon exerts less pressure on the earth at that time." For the moon is always of the same size in bulk, however much or little we may see of it. My idea is the worms dislike light; for when one digs for and uncovers them in the daytime, they always seek to hide themselves at once. But I have noticed that fish are inclined to bite more freely "in the dark of the moon," and have long since inclined to believe that it is because they feed nights "on the full of the moon," monolight being sufficient light to seek their food by.

Neither do I believe, with many, that a south wind is favorable to a good day's sport, any more than a wind from any other quarter, and sometimes have thought my luck poorer in a south or southwest wind than in a wind from some other quarter. In fact my favorite breeze for a good day's sport on our trout brooks and other waters hereabouts is a northeaster, though not a northeast gale. I do not like a stiff breeze for a ryokind of fishing except blue-fishing. A

day's sport on our trout brooks' and other waters hereabouts is a northeaster, though not a northeast gale. I do not like a stiff breeze for any kind of fishing except blue-fishing. A gentle breeze, enough to make a ripple, is the best, and the best sky for sport is a broken sky with moving clouds and an occasional sprinkle of rain, such as we have on those days when it looks likely to be rainy and half inclined to clear off. But sometimes the fish will bite freely in bright weather, and sometimes in very heavy weather, sometimes all signs fail, and many times the fisher goes home empty handed, and so my advice is to all who love to angle, to go fishing whenever they can, take the bad luck with the good, and they will find their scores larger at the end of a season than the takes of those who only fish when "the signs are right."

C. T. D.

right."
Brookline, Mass., Feb. 13, 1892.

AMATEUR ROD-MAKERS.

BROOKLINE, Mass., Feb. 13, 1882.

AMATEUR ROD-MAKERS.

Let us see who and what they are, how they work, and what is required to complete a good rod.

To begin with, they are all anglers, in the highest sense of the term, or at least wish to be considered so. They are found in all classes of life, from the humblest to the highest, from the country school boy, who, cutting a white birch in his neighbor's wood, stripping off the bark and dries, and perhaps paints it, and thus prepares a rod with which to fish the streams and ponds of his native town, to the more wealthy man, city bred, who essays a spilt bamboo with German silver trimmings, red silk windings, etc. Such a rod is for the artistic cast of the fly and will be more likely to whip the lakes and streams of far-off "Rangeley" than the humblest brooks of little "Rhody."

With all it seems to be, with many I know it is, a pleasure to prepare one's own tackle. It beguiles many a long winter evening, and when the trout have commenced to roam the spring brooks which have broken from winter's cold embrace, and you have killed some of the speckled beauties on a rod and with tackle which is the result of your own labors and ingemity, then may you boast without vanity of the lonor, for it is not an empty one.

With him who cuts his rod in the woods many of us have had an intimate acquaintance. The split bamboo, however interesting its manufacture may be, I shall of necessity puss without description. As yet it might well be called one of the hidden arts, known, I firmly believe, in its truest sense, only to those professional rod-makers who have risco the highest arts and cotton strings of boyhood, and as yet have not reached that pinnacle of fame, the split bamboo, ond who are content for the present, at least, to ded with lance wood, green heart, ash, and the woods more commonly used in rod-making. With this class, which is, I presume, the largest, I have gained through my own tralas a greater in timacy. Let us, therefore, follow briefly one who has prepared to

despair he knows not which way to turn, for nothing can be done until all the stock is complete.

At this stage the friend of sample-rod fame, hearing of the dilemma, kindly furnishes an all-sufficient supply. With renewed confidence and faith in his fellow man, he turns joy-fully to the bench. Now, with plane, file and sandpaper, the rough wood gradually medical the form of a rod. As it passes through the various stages of planing, filing, etc., the pattern is often consulted, and the pole carefully calipered and measured. His friends, too, are from time to time called upon to inspect, pass judgment and advise, and the benefits derived therefrom no doubt assist materially in the perfect success of the venture.

The wood is finally fashioned to its proper size, length and taper. The fermies are roughly fitted on to satisfy himself that the "hang and feel" are as they should be. Now, for a lathe with which to shoulder and smooth his ferules preparatory to nickeling, and for a place and tools to make his real plate and butt ferule, saw his hollow wire into guides, etc., etc., the room and tools of another convenient friend are used. To solder the guides and other work of a like nature the time and tools of still another friend are borrowed. I may have forgotten to mention that amateur rod-makers were sometimes obliged to borrow; such, however, is the case. The guides, tip-pieces, ferules, and all other metallic work connected with the rod, are sent to the nickel-platers, the rod meanwhile receiving its smoothing, coloring, polishing and fine windings between the points set apart for the guides, On the tip he winds the fine turns about one inch apart, on the niddle piece a little further, on the butt still further. Here, for my own part, let me say a word about the guides, for I consider them more important than any other part of the trimmings, unless, perhaps, the ferules. Avoid always the loose ring and keeper so much in use by the professional rod-maker. Why they continue to put them on their best rods, even un

gamy ush.

I have endeavored to convey a slight idea of the troubles and details of the rod-making of the amateur who, with but little capital, attempts to equip himself with home-made

to capital, arround the rod already described, if he would be a addition to the rod already described, if he would be a different well up in stock he must have a variety of rods of different lengths and weights. Should be presume to cast a fly and still desire to be his own caterer, he must learn to tie his own flies, as he has already learned to tie his Carlyle hook and

still desire to be his own category as most search to the his Carlyle hook and gut leaders.

Let not the bait fisher be discouraged at the many and varied obstacles to successful fly-tying and fly-fishing, nor become dissatisfied with his rank, for, though he may never become an adept with a tly, he is none the less a true angler so long as he pursues the sport observant of all the beauties with which nature surrounds him, never carrying it beyond that point where it ceases to be a sport and recreation, and becomes a butchery of that which might yield new pleasures on some future day. Nother should the expert fly-caster, as he whips the open pool and lake, revile him who baits with a worm or minnow. The patience, skill and endurance displayed by the so-called "worm drowners" as they silently wade the whirling, tumbling brook, taking here and there a speckled beauty from out the pools and rifts so shut in by the overhanging adders that no artist of the fly would attempt a cast, should entitle them to an honorable place among the followers of the "groutle art."

Ruoov. a cast, should entitle them to an honorable place among the followers of the "gentle art." Rhody.

"FROSTFISH" OF THE ADIRONDACKS.

IN looking over the report of the American Fishcultural Association for 1881, I find the "frostfish" of the Fulton Lakes described as a "smelt," and think there is a great mistake shout this matter.

Lakes described as a "smeit," and think there is a great mistake about this matter.

My impression is that the "frostfish" of the Adirondack waters is neither more not less than the "shad-waiter" of Lake Winnepesaukee, or the Prosopium quadrilateratic of Prof. Milner, a small variety of the whitefish.

No smelt, salt water or fresh, that I ever saw would weigh a pound, or half of it, and one or two ounces is nearer the weight of the fresh water smelt. Besides the smelt does not spawn till spring, while the "shad-waiter," like the frostfish, runs up to spawn in October and November, and then disappears until next spawning season. I have never seen the frostfish, but from Mr. Wilson's description of him he answers exactly to the Winnepesaukee whitefish, which averages about one pound in weight, has a snout and is a bottom feeder.

feeder.
When at Connecticut Lake last June front fishing, I was told of the existence of a fish in that lake, called by the lumbermen the "blue-bill fish," which also answers the same description, and I famey from the peculiar habits of only appearing at spawning time, that these fish may be more widely distributed than we are at present aware of.

Same, Webber.

REEL FITTINGS.—A correspondent writes: "Will you oblige by informing me if those Hardy which fittings, advertised in the late numbers of the English Fishing Guzette, can be obtained at any place in this country? Reel fixings we he doubt the seal them. I am making a small rod for fishing brush-covered streams, and want to get these fixings to put on it. Shall esteem it a favor if you can give me the information desired." We have seen several new fittings for reel scats this winter, more or less excellent, which abolish the old sliding ring altogether. We have forgotten whose inventions they were, and, as they are not yet advertised, if the inventors will send us a description of them we will forward them to nur correspondent. them to our correspondent

CAN ANY FOOL CATCH FISH?

On Raquette Lake, at Ike Kenivill's, I found them hard at work on an addition to their house, preparing for the summer rush. Looking into one of the rooms I found a plasterer and his helper at work. We were soon chatting. "You're come up here to fish, ain't yer?"
"Yes: I'm woing to try it." said I.

plasterer and his helper at work. We were soon chatting. "You're come up here to fish, ain't yer?"

"Yes; I'm going to try it," said I.

"Walt," said he, "I used to think any goll darned fool could ketch fish. Why, to'ther Sunday I went cout in a boat with two other fellars, and they was a fishin', and fust one hauled up a fish and then the to'ther, and sich whoppers—why one on 'em had a mouth on him big enuf to stick my head in." I could not make out which had the big mouth, one or other of the "fellars," or the fish, but supposed he meant the fish. However, that point was soon settled, for his helper, a raw youth of seventeen, elapped his old cap over his mouth and fairly snorted at his varn. "What's yer laffin at?" said he, "Well," said the boy, "you might ent that down abcout half, mighten't you?"

Nothing dunnted, he continued: "I thought there was no knack about catchin' fish, so next Sunday I went out, and sot there in the boat most all day. I baited my hook and hung it over the side of the boat, but not a bite did I get; I moved the boat and tried again, and nary a fish did I get; an 'so I made up my mind that every durned fool esuldn't eatch fish, and I rolled up my line and went home."

And from my little knowledge of the business I think he is about right. To be a fisherman requires skill, and this can only be acquired by long practice, natience, adaptibility and good nature. A lazy man can never be a good fisherman; and a nervous, excitable man should never handle a fishing ord within half a mile of any other fisherman. J. R., Jr.

Canadian Duty on Fishing-tackle.—The Toronto Mack says: Mr. Patton, collector of Customs, and Mr. McLean, chief clerk of the Customs, were interviewed yesterday respecting the alleged grievance suffered by Toronto firms who import fishing-tackle. The complainant, as one of the manier, said that nearly a year ago frey had a difficulty with the Government in connection with the duty imposed on fishing hooks and lines. It was stated that for nearly twenty vertices articles had been passed free through the Custom Holin Toronto, but suddenly they had been stopped and duty demanded. It was further alleged that hooks and lines with passed free in Montreal, and the question was naturally asked why not in Toronto? To these statements and question tarfollowing replies have been made by the gentlemen about and the first, that fishing-tackle, except of a certain kind was passed free under the old tariff, and that under the new tariff there was a certain kind of fishing-tackle on which no duty was charged. For instance, fishing-tackle on which no duty was charged. For instance, fishing-tackle on which no they were not chargable with duty. If an importer made anti-were not chargable with duty. If an importer made anti-davit that the articles were to be used only for fishing purposes proper—in the prosecution of a business—then they were admitted free. But of course it was impossible for them to make such affidavit, for they could not rell how the fishing gear would be used after it left their possession. With regard to the statement that these articles were passed duty free in Montreal, there was probably a misconception of fiels. The family was not so definite in its instructions as to reach duty on each separate article of fishing gear. The articles could not readily be enumerated, and therefore the 1-2 important duty was left to the appraisars, who sometimes differed in what they considered dutiable portions of fishing-tackle.

Hishculture.

FISH AND LAWS IN NEW HAMPSHIRE.

FISH AND LAWS IN NEW HAMPSHIRE.

THE land-locked salmon, which the Fish Commissioners of this State have been planting the last few years, are being heard from. Passing by Sunappe Lake a few days since, the conductor of the train on the Concord & Claremonti Road told me that he weighed one last summer which was brought on board the cars by a man who did not know what he had got hold of which weighed 4½(bs. This was probably one of the first plant of 1878.

We secured several amendments to the Fish and Game laws at the last session of our Legislature; one prohibiting the introduction of different varieties of fish info any waters in the State without the consent and permission of the Fish and Game Commissioners. This was done to prevent the introduction of pickerel and black bass into trout waters, and the penalty fixed at fifty dollars.

One, forbidding the owners of private waters to restock them from public waters during close time. This to get round a weak spot in the old law, which the trout-breeders slipped through.
One, restoring the prohibition of "the capture of female lob-

a weak spot in the old law, which the trout-breeders slipped through.

One, restoring the prohibition of "the capture of female lobsters while carrying their spawn or hatching their young," which was stricken out of the statutes by the Legislature of 1879; and here we want Forest and Stream to take hold and help us, and urge the Legislatures of Maine and Massachusetts to pass a similar law. It will do more, if enforced, to replenish the fast diminishing crop of lobsters along the New England coast than anything else I can think of.

About 375,000 young salmon are in the hatching house at Plymouth developing themselves, so as to become inhabitants of the Pemigewasset River next May. The river was full of young ones last summer, and the natural plant last summer all along the river must have been very large, as many large salmon entered the Merrimac last year, but were prevented by the drouth from reaching near waters, and probably spawned where best they could. Mr. Powers, however, seemed 125,000 eggs at Plymouth. The total prohibition on this river for salmon expires June 14, 1882, and a friend made me a present of a salmon line last week! I shall lay in a few flies by the time the birds sing, and if I "hear anything drop" to our line, I'll drop you another.

Charlestown, N. H.

CHARLESTOWN, N. H.

WHAT'S THE USE?—Did I hear somebody say, "What's the use of stocking the streams with trout and other fish, only to have them caught out again?" Why, bless you, dear neighbor, what's the use of planting potatoes in the spring, only to dig them again in the fall? We want people to come here and catch these fish, and we want them to go home and tell their friends what a fine time they had fishing up this way, and they will be on hand next year 10.000 strong and will leave us all the way from \$50 to \$100 each.—Hancock, (V. J.) Herald.

THE IOWA COMMISSION.—At a recent meeting of the Farmers' Institute, of Iowa, at which Mr. B. F. Shaw made an address, resolutions were offered: Whereas, As farmers and citizens of Jones County, we have carefully observed the working of the Iowa Fish Commission under the efficient and honest management of Hon. B. F. Shaw, and Whereas, We believe fish culture to be a good and practical method of in-

creasing the food supply of the county, therefore, Resolved. That we recommend the Legislature now in session at Des Molnes to make a liberal appropriation for the advancement of fishculture, for the propagation of native and foreign fishes adapted to the waters of Iowa. And we luther recommend that the Hon, B. F. Shaw be continued as fish commissioner, and that the Legislature take such other steps for the advancement of fishculture as they may deem necessary.—A. G. Paxenuex, Chairnaan Committee.

One hundred thousand lake trout spawn were received and placed in the state fish house a few days ago.

WHITEFISH CULTURE—Milwaukee, Miss., Feb. 17.—
The United States Fsh Commissioner's boat, having on board
J. F. Ellis, G. H. Moore, Frank N. Clark and S. Bowen, of the
United States Fish Hatchery, at Northville, Mich., passed
through this city last night. Six million whitefish spawn were
taken out on this trip, of which 2,000,000 were deposited at
Muskegon, Mich, 2,000,000, at Racine, and the other 2,000,000
were to be placed in Lake Michigan at Sheboygan.

THE AMERICAN FISHCULTURAL ASSOCIATION.—In addition to the papers to be prepared for reading at the next meeting, announced in our last issue, one is promised by Mrs. Amelia Lewis, editor of Food and Health. The subject chosen by Mrs. Lewis is "The Carp and its Qualities as a Food Fish," a subject of great interest, and one with which she is highly qualified to deal with.

CALIFORNIA NEWS.—The Sacramento Bee says that Mr. R. D. Hume intends starting an extensive salmon hutchery on Rogue River next summer. The result of a small hatchery established by him has been so satisfactory as to justify a permanent establishment.

LAVERACK PEDIGREES.

LAVERACK PEDIGREES.

W E publish below an interesting article upon this subject from the pen of our valued correspondent "East," who gives a lawyerlike review of the question, that can but commend itself to our readers. At the same time he gives us a dig on the color question. The veteran, John Davidson, also gives us a rup on the knuckles. That is right, boys, pitch in; we own that we were to biame for our carelessness in allowing the mistake of "Justice" to appear. Of course he referred only to the progeny from pure Laverack bitches, and never having seen nor heard of one of the color, wrote as he did, and we, by adopting the article, have got into a pretty scrape. We never did fancy the color anyhow, and now we like it less than ever. The following is the letter of "East:"

In the FOREST AND STREAM of Feb. 2 the writer of the article upon "Laverack Pedigrees," presumably the field kennet editor of FOREST AND STREAM, puts a question to Mr. Llewellin which exhibits so forcibly either one or the other of two traits not uncommon in newspaper writing—great carelessness, where extreme care is demanded, or great ignorance of the subject treated, that it seems to demand more than a passing notice.

The writer asks "why it is that the Edmond Castle strain.

where extreme care is demanded or great ignorance of the subject treated, that it seems to demand more than a passing notice.

The writer asks "why it is that the Edmond Castle strain when crossed with the Laveracks does not show its colors in some of the progeny of such a cross?" and adds "it is well known that none of Fride of the Border's get have shown a trace of liver, which is the characteristic color of the Edmond Castle setters." This is certainly a very curious statement, and if this was the only question which Mr. Llewellin must necessarily answer before he can prove Pride of the Border crossbred, and if his being crossbred or not depended upon this answer being in the affirmative or negative, it would be a very simple matter, and the decision could be quickly reached, for it is indeed "well known" that Pride of the Border der did get pups showing liver color. For we find that among the pure-bred Laveracks in this country, Brough, Charm, Daisy Dean and Ranger, and in England, Bandit, all direct descendants of Pride of the Border II. and Fate, and in England Fred V., La Reine, Maid of Honor, Pearl, Silk II. and Witchurch Bess, descendant in the second generation from Pride of the Border, are also marked with liver, and again in this country, Pride of the Border II. and Fate, and in England Fred V., La Reine, Maid of Honor, Pearl, Silk II. and Witchurch Bess, descendant in the second generation from Pride of the Border, are also marked with liver. And many other sons and daughters of the old dog, but outside the pale of purely-bred Laveracks, might be mentioned as showing liver color in their markings. But what really does this matter of color amount to, anyway! Does it prove or disprove anything? Does it or does it not make Pride of the Border crossbred that he was liver and white in rolor! If so, does it not at the same time implicate the entire strain as well as this one dog! In order to anywer these questions in a fairly satisfactory manner, it will be ecessary to examine the proofs given by Mir. Ll

his picture with that of other well-known specimens of the breed.

If, then, it was not his type which caused his recognition of cross-breeding, it must have been his color, and until we have positive information that liver color had never been known in Laverack's kennel until Pride of the Border appeared until we know authoritatively that Mr. Laverack had not been in the labit of destroying liver-colored pups from his litters and saved Pride of the Border because he was the only one of the litter or because the litter was small, we are hardly in a continues to accept this alone as evidence proving anything. It, however, undoubtedly has a certain value in the discussion of the question of Pride's breeding, and considering the connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from this connection with the rest we have then as evidence from the form the form of the Border was

by neither Dash II. or Fred II., because, had he been by one or the other, Mr. Laverack would have been most unlikely to have made a mistake, since he always attended to the mating of his dogs himself." and second, Mr. Laverack and Mr. Robisson adrait one Edmond Castle cross, and Mr. Laverack stated to a number of persons that Pride of the Border's color was due, to use the form as given by Mr. Laverack, "to a reversion to the color of the animal with which then, in the first place, that we are to accept Mr. Llewellin's unsupported statement that Pride of the Border "was a direct outcross," because Mr. Laverack, in giving a pedigree, undoubtedly from memory, at one time mentioned Dash II. as the sire of Pride and at another time gave Fred II. as the sire. There appears no evidence that any other dog was mentioned, or even hinted at as having sired Pride, hence either of these two might have been the sire and yet not have affected the result of Pride's being purebred, and "Jumen" in one of his articles in Land and Wafer explicitly states that "nobody doubts that the immediate ancestors of Pride of the Border were given correctly" in the pedigree as printed in the K. C. S. B. Yet Mr. Llewellin, notwithstanding he takes the letters of "Lumen" as partial proof of the assertion he makes against Pride, does not appear to be willing to admit that the different statements made to various parties by Mr. Laverack might be due solely to failing memory, and because these varying statements have been on de, therefore Pride of the Border must be outbred.

This is certainly curious logic. But if we are to hold a person to such strict account for lapses of memory as to let the

ellin, notwithstanding he takes the letters of "Lumen" as partial proof to the assertion he makes against Pride, does not appear to be willing to attnit that the different statements made the proof of the state of

in her case, being by Dash II. out of Moll III., it would serve to throw the onus of the liver color of Carlowitz, according to the very generally accepted theory of hereditary descent, upon Countess.

We might add a strengthener to this side by bringing another example in the shape of Adams' Rock, a liver and white dog by Bruce out of Daisy. Bruce was by Dash II. out of Statter's old Rheebe, and Daisy was full sister to Countess and Victress. Now, where does this liver come from? Does it come from Rheebe or from Dash II. or from Dash II. or the conference of the Border of the Border is due to an outcross, and is sufficient to make him outbred, that Carlowitz, Victress, Pride of the Border and Rock should all strain in the naternal line to Belle II. and all be liver and white. Now, does Mr. Llewellin wish us to infer that Carlowitz and Victress, as well as Pride of the Border are outbred! Is there any question in regard to their pedigrees? Are Lill and Countess and Daisy and Prince and Phantom and Petre all outbred?

Mr. Llewellin says that he recognized at once that Pride was crossbred, and leaves us to infer that it was solety on account of his color, and this despite Mr. Laverack's assertion that Pride was "as pure bred as any." Now, in view of the facts that he has kept to himself during all these years his recognition of cross-breeding in Pride of the Border, and that

he sent Carlowitz, a liver-colored animal, to America as a pure bred Laverack, does he expect that we will accept his unbacked assertions, now first promulgated, that Pride was a crossbred dog, and not believe that Carlowitz was a crossbred dog, and not believe that Carlowitz was a crossbred dog, also, and heuce not believe that Mr. Llewellin has been acting in a traudulent manner during this same period? But it Carlowitz is crossbred, then all the Laveracks, without a single exception, are crossbred animals. And this is undoubtedly true, just as every living thing is unquestionably crossbred; but we shall in all probability have to look much further back than Pride of the Border, and perhaps even than thirty years, for that strain of Edmond Castle blood which Mr. Robinson says was "then infused into Old Moll." So far as Mr. Laverack's simple statement goes, it would carry the infusion of Edmond Castle blood back to a time which would at least cover his first appearance with his dogs at trials and shows. Yet, even if we accept in full Mr. Laverack's statement that the color is due to a reversion to the color of an animal used in some past time to cross with, it is not necessary in order to account for this color to maintain that the direct strain from this outcross was ever kept up, since it is well known that bitches that have once thrown pups colored outside of their line will almost invariably again, regularly or irregularly, throw similarly colored pups by any dog by whom they may be served, so it is entirely possible that Mr. Laverack may have used a dog of the Edmond Castle strain with his bitches, as he did dogs of other strains, and afterwards not have retained a particle of this blood in his breed, and yet the color of the dog used, from its peculiarity, might have so impressed itself upon the bitches or bitch used, as to have remained, cropping out in pups which were for the most part, if not always, destroyed, and in such case the color would be truly a reversion to a strain which had been made use o

Editor Forest and Stream:

I am pleased to see that the Forest and Stream office has not suffered from the late fire among your near neighbors. I am afraid you have been permitted to secape only to suffer later, unless your publication of kennel matters is more centrate. I refer to the article on Laverack pedigrees, which stated that "none of the get of Pride of the Border show throat the "none of the get of Pride of the Border show throat fiver." This is a serious mistake, as Charm showed nearly all liver. Daisy Dean was also liver and white. These were from pure Luverack bitches, and I know of a neberer others that were sired by him that are liver and white. Charm also transmitted the color, as a full litter by him, out of Doll, were liver and white. This is none of my quarret, and I only write to set the matter straight.

I am very far from agreeing with "Jack" in his estimate of the pointer as compared with the setter, as my experience has been that the pointer could not begin to stand the hard, rough work and bad weather that the setter could. I think it absurd to say that as a class either has the best nose. Individual dogs of both breeds will show a superior nose to others, but as a rule I do not believe that pointers have any better nose that setters and as a companion to have around you they are not to be compared to them.

John Davidson.

THE DACHSHUND.

OUR English correspondent has sent us copy of a letter on this breed addressed to Mr. S. E. Shirley, President of the English Kennel Club, by the President of the German Dachshund Club in reference to the different standards set up in the two countries by which it is proposed this game breed of earth-goers should be judged; and also copies of these standards, which we reproduce below. We feel certain that all American sportsmen, and especially those who appreciate this purely German terrier, will see the full significance of the communications.

American spot and, and a purely German terrier, will see the full significance of the communications.

It is clear to us that if this breed is to take root in American soil we must go to Germany and not to England for the sires and dams that are to found our stock. The English stamp of dog may be equally useful, but as we must suppose Germans to know best the points of their native races of dogs, we think the name Dachshund should be restricted to dogs of the genuine breed, and we would suggest that those according with the standard of the Dachshund Club of England might properly be termed badger-hounds, as they approach nearer in conformation to the blood-hound type than the terrier character insisted on by German breeders and sportsmen.

The following, which we copy from Dalziel's "British Dogs," is

THE GERMAN DACHSHUND STANDARD.

1. General Appearance—Low and very long in structure, the forepart, not only the chest, especially well developed, legs very short, the fore legs turned inward at the knees, but the feet considerably bent out. The whole appearance is weasel-like, the tull is moderately bent, and is carried very little above a horizontal line, or else downward. Hair close, short, smooth. Expression intelligent, attentive and lively.

2. Head—Somewhat long, tapering toward the nose, wedge-like, broadest at the hind part of the skull, and without a stop; skull broad, almost flat; nose narrow, straight, sometimes a little upward-bent; lips very little hanging, forming a small fold at the corner of the mouth.

3. Ears of medium length, tolerably broad, and rounded at the end, which is less broad than other part. The ear is placed high up and well backward, so that the space between ear and eye appears considerably larger than with other hunting dogs. The ears are not wrinkled, but hang down close at the cheeks.

dogs. The ears are not wrinkled, but nang down close as checks.
4. The eye is of medium size, round, neither protruding nor

sunken in (klar, vorliegend, i. e., well visible when seen from the side), and very sharp in expression.

5. Neck—Long, flexible, broad, and strong; the skin some-what loose in front.

6. Back—Very long, slanting towards the tail; loins well de-veloped.

veloped.

7. Breast—Broad, framework of ribs long and deep, the

veloped.
7. Breast—Broad. framework of ribs long and deep, the flauks drawn in.
8. Tail—of medium length, strong at the roo, and tapering to a thin end; almost straight, and carried as said above.
9. Forelegs—Muscles stronger than at the hind feet; the shoulders very muscular, upper arm short and strong, bending outward; the knees bent inward, the feet again outward. The legs seen in the profile must appear straight, not hanging over in the knees.
10. Hind-legs—Straighter than with other dogs, seen from behind almost straight; the quarters have muscles well visible, almost pointing out (eitrig), the bone from hock to pastern very short.
11. Feet—The feet of the fore-legs are more muscular than those of the hind-legs, the toes well closed, with nails strongly curved and black; it is sole of the foot is broad and thick. The toes of the hind-legs are shorter and straighter, the foot also smaller.

those of the hind-legs, the toes well closed, with nails strongly curred and black; the sole of the foot is broad and thick. The toes of the hind-legs are shorter and straighter, the foot also smaller.

12. Huir—Short, close, and glossy, not soft, but resisting to the touch (mit stechender spitze) when stroking it; very fine and close at the ears, coarser and longer at the lower side of the tail, but here also lying close to the skin. On the belly the hair is a little coarser, and the skin well covered.

13. Color—Black, with tan at head, breast, front of neck, belly, legs, and under the tail; also dark brown, golden brown, hair, gray with darker stripe on the back; as also ash gray, silver gray with darker stripe on the back; as also ash gray, silver gray with darker stripe on the back; as also ash gray, silver gray with darker stripe on the back; as also ash gray, silver gray with dark patches (tigerdachs). The darkor colors are mostly united with tan markings; with lighter colors the nails ought also to be black, and the eye always dark. Any white is only to be endured as a small mark at the chest.

14. Teeth—Upper and lower teeth meet exactly; in proportion to the jaws they are stronger than with any other breed, especially the corner teeth.

As faulty are considered dogs who have a compressed or conical head; the muzzle too short, too broad, or with a stop at forehead; when the lips are hanging; the ears folded, or not hanging close; when the fore-legs are so crooked that the knees touch each other, or are unable to bear the weight of the body; when the neck is thin and the breast too narrow; when the fore-feet are too much, or irregularly turned outward, when the knee-joint is weak and the toes spread out, also when the bone from the back downward is too long and the hocks too close together. The tail is bad if it is crooked or has long hair sticking out. Any white as principal color is also faulty.

The standard as settled by the English Dachshund Club. November, 1881, is as follows:
Head and Skull (12)—

Jaw (5).—Strong, level, and square to the unuzzle; canines recurvent. Chest (7).—Deep, and narrow; breast bone prominent. Legs and Feet (20).—Fore-legs very short and strong in bone, well crooked, not standing over; elbows well clothed with muscle, neither in nor out; feet large, round and strong, with thick pads and strong nails. Hind legs smaller in bone and higher, hind feet smaller. The dog must stand true, i. equally on all parts of the foot.

Skin and Coat (3).—Skin thick, loose, supple, and in grea quantity; coat dense, short and strong.

Loin (8).—Well arched, long, and muscular.

Stern (5).—Long and strong, flat at root, tapering to the tip; hair on under side coarse; carried low except when excited.

Body (3):—Length from back to head to root of stern two and a half the height at shoulder. Fore-ribs well sprung, back ribs very short.

Color (4).—Any color, nose to follow body color; much white objectionable.

Symmetry and Quality (11).—The Dochshund should be long,

objectionable.
Symmetry and Quality (11).—The Dachshund should be long,
low and graceful, not cloddy. Total 100 points. Weight: Dogs
about 21lb, bitches about 18lb.

The following, is the letter referred to:

The following is the letter referred to:

"My Dear Sir—Would you, as honorary member of our club, kindly grant us the following favor?

"From the description of some prize Dachshunde, and from the 'Dachshund Standard,' lately published in the Field of the 12th of November by the English Dachshund Club, we cannot help noting that the points differ essentially from those of the 12th of November by the English Dachshund Club, we cannot help noting that the points differ essentially from those of the German standard fixed upon by our own competent judges at the Hanover show in 1849.

"Your countrymen have given this breed the German name of Dachshund, thereby acknowledging the German descent. In consideration of this fact, we feel that it would be only just were you to judge your Dachshunde by the same standard of points as is in vogue in their native country. Not doing this would, we fear, only lead to many misunderstandings, to the detriment of the breed. When judging English dogs, or dogs of English breed, in Germany, it is done on the English standard, and, when possible, by English judges. It would therefore seem to us not an unreasonable request so ask that a similar principle be followed in England with German breeds.

"The Dachshund points lately published in the Field are not

a similar principle be followed in England with German breeds.

"The Dachshund points lately published in the Field are not those of a German Dachshund, but of the French Basset.

"The German Dachshund is no hound, but a terrier. It is apparent from the points given that our light dog of five to seven kilogrammes (9b. to 13bb. English, about), so much prized by us, is either quite unknown or not approved of. Our club has therefore decided to lave a model of a Dachshund made, together with description and drawing specifying the standard points fixed upon in Hanover.

"These points have been described by an Englishman (Mr. Hugh Dalzel, in his "British Dogs). We shall have the pleasure to send you one of these models, when finished, and hope that you will do your best to have these points also adopted in England, and leave your present Dachshund points for the Eassets, for which breed they do well enough.

"You would oblige us by having this letter published in the Kennel Gazette, with our full signature, and, if your views agree with ours, we would feel exceedingly obliged by your also addressing a few lines to the Kennel Gazette on this subject.

"The Pachshund Club, Bealin, Dec. 8, 1881."

GORDON, OR BLACK AND TAN SETTERS.

Editor Forest and Stream:

I was very much pleased to see in your issue of the 9th, the letter of Mr. W. Sergeantson which appeared in the London Field. And it is with the hope that it will prove of use to breeders of Gordon setters in this country that I again call at tention to it.

breeders of Gordon setters in this country that I again call at tention to it.

I offer the following questions to your readers, the answering of which will, I have no doubt, be of great use in getting the black and tan, or Gordon setter, back again to his former high place as a field dog. For myself, I have tried for several years and have been partly successful in getting a fairly good dog, but would like to hear others on the subject.

Ist. Is it necessary that a Gordon setter should be a heavily built dog!

2d. What advantages are to be gained by breeding thus!

3d. Are the Gordon setters of to-day as good in the field as when a little white was allowed in the chest or feet!

4th. Will a lightly built dog do the same amount of field work as the more heavily made one?
5th. In the first field trials Gordon setters did very well. How is it now that they are not placed in them?
6th. Have the English setters so much improved, or have the Gordon setters retrograded?
7th. If the former, why cannot the Gordon setter be also improved by judicious breeding? If the latter, who is to blame?
8th. How are Gordon or black and tan setters to be improved so that they may again be heard of as thorough good field dogs?

proved so that they may again be heard of as thorough good field dogs?
These questions have been suggested to me by reading over Mr. Sergeantson's letter, and in one of the later paragraphs of his letter he gives his ideas, which are well worthy of note, and I trust will be acted upon by those who have the love of a good field dog at heart.

London, Ont.

THE NEW YORK DOG SHOW.

THE NEW YORK DOG SHOW.

THERE is every indication that the coming show of the Westminster Kennel Club will be a very successful one. Entries are coming in freely. The premium lists have been mailed to all of last year's exhibitors, and any one wishing them can procure copies by addressing Mr. Chas. Lincoln, Supt., 23 Park Row, or by applying at this office. The railroads have responded favorably to the request of the managers for free transportation for the dogs, when accompanied by an attendant. Exhibitors coming by the Erie must apply to Mr. J. C. Abbott, general passenger agent. New York, for a permit. The express companies will, as usual, return free all dogs that have paid charges one way.

There will be a large and valuable list of special prizes offered, which we shall publish as received each week. Mr. C. Du Bois Wagstaff, Babylon, L. I., will give a handsome meer-schaum pipe, value \$50, for the best pointer puppy under twelve months old. A member of the club will give \$15 cash for the best pointer dog and \$10 for the best pointer bitch sired by Sensation. The class for St. Bernard pupples will be divided into rough and smooth-coated, and exhibitors must designate to which class their entries belong. We understand that handsome prizes will be given for the best exhibition of yard training adapted to field use. This class should fill well, and it will undoubtedly prove one of the most attractive features of the show.

The following well-known gentlemen have been appointed

undoubtedly prove one or the most actuative transfer show.

The following well-known gentlemen have been appointed as judges: For English setters, J. O. Donner, Esq., New York; for pointers, greyhounds, deerhounds, foxhounds, beagles and dachshands, Hon. Jan O. S. Wise, Richmond, Va.; for foxterriers, bulldogs, bull-terriers, Skyes, Yorkshires, dandies, rough-haired and toy-terriers, Italian greyhounds, King Charles and Japanese spaniels, G. de-Forest Grant, Esq.; for collies, Jas. Watson, Esq.

Charles and Japanese spaniels, G. de-Forest Grant, Esq.; for collies, Jas. Watson, Bsq.

CROSS-EYED DOGS.—West Winsted, Conn.—I have a cross-eyed dog, the only one I have ever seen or heard of. But this is due to my very limited experience. Has any one ever had any experience in regulating or curing strabismus in a dog? This dog is coming two years old, a Laverack, a grandson of Pride of the Border. His father was bred in Albany by Mr. Dudley Alcott. (I was congratulating myself on the fact that my dog came from purely bred ancestry on his father's side, but the recent communications from Mr. Liewellin seem to throw some doubt on that, for he says Pride of the Border was not pure. All owners of this stock are much interested in knowing the true inwardness of this matter. Cannot some one speak with authority? Will not Mr. Laverack's stud-book throw some light on the subject? Be this as it may, my dog is a good one, staunch, good nose, and a fine retriever. People tell me he can see double—once with either eye—and that thus I can bag two birds where in reality there is only one. There may be circumstances in which this would be a manifest advantage, but unfortunately all dogs descended from Pride of the Border (and this irregularity is doubtlessly explained by the fact that Pride of the Border was not purely bred) hunt with the nose, and as this fellow's nose is not cross-eyed, the claim is of no practical service. Would you advise me to have an operation performed on his eyes? Would there not be too much danger of making his condition worse rather than better? I shall be glad to have a word from you or some of your readers on this subject.—REGULUS.

FOX HUNTING IN MASSACHUSETTS.—We have received a notice from the Myopia hunt. We are pleased to see that the sportsmen of the old Bay State are taking an interest in this matter, and trust that we shall be called upon to chronicle some glorious sport. This club has been organized to maintain a pack of hounds to hum the country adjacent to the town of Winchester, Mass. The Myopia Club have granted permission to erect the kennels on their premises. The annual assessment will not exceed \$100. Gentlemen desirous of joining will please send their names to either of the undersigned. Hugh A. Allan, No. 80 State street; Frank Seabury, No. 44 State street, Boston.

SNAP.—We have received a picture of the red Irish setter Snap, owned by Mr. W. W. Rice, Hudson, N. Y. Snap is by Max Wenzel's Chief out of G.Hill's Tilly; is six months old, a solid red in color, 23 inches high at the shoulder, length of head 9½ inches, 3½ inches from corner of eye to end of the nose, and is 51 inches from end of nose to tip of the tail, and weighs 40lbs. He is remarkably well developed for his age.

KENNEL NOTES.

NAMES CHANGED.

NAMES CHANGED.

Phantom to Katrina. Dr. James Warner, Hayana, Cuba, has changed the name of his liver and white pointer bitch Phantom (Croxteth—Vinnie io Katrina.

Prince Laverack to Prince. Mr. James II. Goodsell. New York, wishes the name of his pure Laverack seter dog Prince Laverack changed to Prince, as Mr. Snellenburg, of New Brighton, Pa., has a prior claim to the name.

PEDIGREE WANTED.—Can any of our readers give the pedigree of the red Irish bitch Goube's Sue?

Answers to Correspondents.

CONSTANT READER, Washington, D. C.—See answer to J. C. McC. Jan. 25.

FARMER, Danbury, Conn,—Send us your name, that we may know what credit to give to your communication.

E. L. K., Brooklyn, N. Y.—I fail to kill crows with charge of 3½dr owder, 1½oz. shot, in 12-bore. Ans. Reduce your shot load to 1oz. or

F. D. B., Mt. Morris.—Quail have been successfully transplanted from the South to this climate; but, on the other hand, many of these experiments have failed. We hope that our correspondents will advise us of success or failure in their undertakings.

us of success or failure in their undertakings.

ATLANTA, Atlanta, Ga.—Last summer I allowed my dogs to sleep under my verandah. This winter has been mild, and I now find the place infested with fleas. Can you tell my any way by which I can get rid of these pests? Ans. Use carbolic acid freely.

X., Harrisburg, Pa.—What is the difference between wild rice of Minnesota and that of Eastern Canada? Which is best suited for Susquebanna River, vicinity of Harrisburg, Pa? Ans. They are identical; either will grow in the locality named if properly planted. The great mistake of most experimenters with wild rice is that they do not sow enough.

H. W. Philadelphia.—Can you recommend a good place to camp for July? Would prefer some place where can have good boat fishing. Would like some place within 30 miles of Philadelphia. Ans. There are good places in Pike counts, Pa. Go to Scranton and try the streams between there and Hawley; or go up the Bushkill, on the south of Pike county.

Pike county.

Pointer, Poughkeepsie, N. Y.—My pointer cut one of his toe paquite badly some three weeks ago. It does not heal. Ought it to sewn up, or will it eventually come together again? Ans. Clean twound thoroughly and apply a plaster of pime pitch and put a book his foot. If there is a loose flap of skin it may have to be trimmed cas it will not unite after so long a time.

W. T. M., Brooklyn.—1. The Ditmar powder is so dangerous that its use has been practically abandoned by sportsmen. 2. Some of the prominent symptoms of worms in the dog are constant retching, foul breath, a dry cough, irregular action of the bowels, a rough or staring coat and emaciation. 3. Areas mut powdered; a heaping teaspoonful for a medium sized dog, to be given upon an empty stomach and followed in two hours by a dose of oil.

Susscinser, Middletown, Coun.—1. I have a bitch, and would like to know whether I have a right to call her red Irish? She weights 60 pounds, red color, rather dark, but not as dark as some, white on breast and throat, a few white hairs on forehead and end of nose; four white feet. 2. Do you know anything of a J. Marbie's celebrated dog?
3. Will it be impossible for me to get my dog registered in the Stud Book? Ans. 1. It is the breeding as well as color that entitles the red Irish to the name. 2. Jerome Marbie's Grouse is a Gordon. 3. No.

Irish to the name. 2. Jerome Marble's Grouse is a Gordon. 3. No. L. S., Red Hook, N. Y.—1. Where is the "English Kennel Club Stud Book" published? 2. What became of the other two puppies (one of the three was Home Ruler) exhibited with Mr. James Watson's Irish terrier Kathleen at New York, 1889: Who purchased the Lachine Kennel Club's Irish terriers Home Ruler (now Splinter) and Kathleen, and where are they now? Ams. I. At the London Field office, 346 Strand, London, Eng. For price write to secretary, F. W. Witson, 29 Pall Mall, London's Ew., Eng. A new volume is published each year, 2. Of the two bitch puppies, one of them died; the other is owned by Mr. Barnette, of this city. 3. Kathleen and Splinter were purchased by Mr. Geo. Krehl, of London, Eng., who has then now.

by Mr. Geo. Krehl, of London, Eog., who has then now.

Dn. C. S., New York.—I have a water spaniel, about a year old, that has been sick for nearly a month. His eyes are inflamed and filled with matter; nose dry and hard; has dry, white spots in two or three places on the legs, where the hair has partly come off. Was at first dull in the house, full of life out doors; has lately been more cheerful. He now has a large swelling on the right side of his head and face. Has been fed with considerable irregularity. Will you please tell me through your paper how to cure him. Ans. Probably distemper. The swelling is undoubtedly an aboess, which should be lanced as soon as pusis formed. A generous diet with a lattle od liver oil once or twice a day will probably bring him through all right.

Dachting and Canoeing.

ONE DAY IN A CANOE.

ORDOR: A small boat used by surgeas, usually holmoral from a tog.

I FIND the above definition in a book on out-door sports published many years ago. I greve you then, lovers of the most many for you whether you have ever taken a enone cruise. I do not mean a pleasant sail uppe some placed in the late to it not or your doorway, or a pleasant sail uppe some placed in the late to the control of your doorway, or you were taken your cance to the headwaters of a rapid mountain produced the late of the control of the late of the control of the late of the control of the late of the

THE DEATH RATTLE OF MEAN LENGTH.

HALF a loaf only, and a shriveled, dried-up little half it is!

Better than none, however, and a momentous gain in one respect is the concession offered to common sense in the report of the Larrhmont V. C. committee on measurement. That the committee, starting with strong prejudice in favor of mean length induced by long custom, which has rendered yachtsmen callous to its defects and surrounded by influences all tending to the preservation of that faulty rule, should have refrained from very radical innovation, is in their recommendations they have cast loose at last from the stolid in their recommendations they have cast loose at last from the stolid suppor which has permitted mean length to drag out its days so long that the end scenied never to come. And so one more club is added to the list which has kicked over the nonsensical system which gauged a few feet of plank haing over the stern at seven times their bulk compared to the hody of the body.

The committee's report, which we have received, is a guardet and the dight of the committee is report, which we have received, is a guardet work carried out with more ability than was to have been expected from amateurs with so difficult at asis before them. Until action is taken by the Larchmont Y. C. in the matter, we reserve a general review of their labors. In the meantime we congratulate the public and ourselves upon the successful uprooting of the mean length vazary under which the club had previously sailed its matches.

The new proposition is to add one-third the overlang att only to the new proposition is to add one-third the overlang att only to the new proposition is to add one-third the overlang att only to the new proposition is to add one-third the overlang attention of the sakely formula of the said mask before them. Until action is the sakely formula of the said mask before them. Until action is taken by the Larchmont commendate modification of the sakely formula of the said mask before them. Until action is the sa

THE YAWL IN AMERICA.

OF lite we note among yachtsmen an increasing disposition to cruise and to voyage in their craft for the sake of the delights and adventure afforded by lengthening out their days afford to weeks and even months at a time. This can only be taken to mean a gradual growth of a love for the sea and its associations, indicating the dawn of the sallor instinct among owners. The first conceptions of the novice are always limited to racing. He goes "down the bay" of an often sallor and the

CUTTERS AT SEA.

Raitur Forcet and Stream;

I would like to put in this little answer to "Hard Down." In your issue of 2d inst, "Hard Down" ventilates his liking for the cutter, and expresses his sympathy for the advocates of the sloop. He argues that those that differ with him about the Madge's virtues, are either tignorant or biassel. Now I am one of those. It has been proved beyond argument, by the time taken, and by eye witnesses, that the importance is the proposite provided by the state of the public by statements he cannot substantiate. The cutter, and mer most circumstances, is noted for just the opposite qualities that "Hard Down" claims for her. The cutter may claw off a leavard shore, but I have yet to see the cutter that will work to windward of the Standow. There is not a cutter or freel boat in existing the standow of the standow with the wind pretty fast," but I will bethin, in most every trial he can make, the cutter will go faster. "Hard Down" say, "A sloop with a whole sail breeze will go down with the whird pretty fast," but I will bethin, in most every trial he can make, the cutter will go faster. "Hard Down" also adds, "that is about all you can say for the shop," Where is the bias now? Give me with the wind pretty fast," but I will bethin, in most every trial he can make, the cutter will go faster. "Hard Down" itso silops with the wind pretty fast, "but I will bethin, in most every trial he can make, the cutter will go faster. "Hard Down" itso silops that will should all you can say for the shop," Where is the bias now? Give me with an easy show of a lee shore, and I also want one that reaches with an easy show of a lee shore, and I also want one that reaches with an easy show of a lee shore, and I also want one that reaches with an easy show of a lee shore, and I also want one that reaches with an easy show of a lee shore and I also want one that reaches she wentually will not demonstrate mich speed, and in working to windward cannot compete with a smart working reacher. If she can combin

the best of her class in Boston or New York, but she is not a match for the cutter at running, nor with the wind bare. In a sea, oven a moderate one, the cutter can romp away from Shadow or any sloop in existence just as she pleases.

The case of the fishermen on "the banks" is not a parallel. They have short spars and small sulls. Fine away their forms for speed and give them racing riss and they would not be slow to discover the boats which can "go" in a seaway, there is of sea boats, and sea boats which can "go" in a seaway, there is of made the sequal to a Vanduara, Sanbena, Julianar or Seabelle. Their them is a seaway in the control of the seaway of the control of the seaway of the control of upprequied persons. The inability of our beamy sloops in rough water is too notorious to require asseveration. Before the next season is up our correspondent and others of his mind in Boston may have an opportunity to test their opinions about cutters to windward should Madge or Maggie sport fighting flags in Eastern waters.

require asseveration. Before the dext senson is no our correspondent and of the of Bis-limit in Boston may have an opportunity to test and of the officers of Bis-limit in Boston may have an opportunity to test sport fighting flags in Eastern waters.

SEAWANHAKA YACHT CLUB.—Next regular meeting at Delmonloc's. Monday, March 6, when the measurement committee is expected to report.

Larchmont YACHT CLUB.—Next regular meeting, Monday, Feb. 27, when the measurement committee will report the result of its deliberations. Until that time we reserve comment meeting, Monday, Feb. 27, when the measurement committee will report the result of its deliberations. Until that time we reserve comment. We are glad to see native talent drawn upon for duly aboard our yachts. The Swide and Teulon are not neat and smart enough by half.

MAGGIE.—Hatcher & Clifford. of Southampton, have finished the cradle in which the Is-fou cutter Maggle will be stowed on her passage from Liverpool to New York by Atlantic steamer. The Maggie is a spinner, and in a tumble off the Hook will give New York's best mental and the statement of the control of the control of the steamship of the mental comments of the producted by Cl. 1. NEW ORLEANS, La	., Fe	b. 1	5,—	The	rifle	ex;	pert	stu	rne	i out in full

NEW ORLEANS, La., Feb. 15.—The rifle experts turned out in full force last week, at Clinton's Gallery, 24 St. Charles street, and made some startling good scores at the new 30-yard range, on the third
floor. The following is the score:
Team Shoot—Possible 504.
L P Chaudet
A H Cox
Wm Welss
Meyer Gutheim
Best Five Successive Scores—Possible 420.
Wm Weiss
LP Chaudet
E.J. Souby
Individual Scores—Possible 168.
L Danonte 80 81-161 Duncan S Cage, Jr
J V Guillotte
JR Stanton
Wm. Weiss, December 18, 1881, 83 in possible 84. L. P. Chaudet, Feb-
rnary 11, 1882, 83 in possible 84. The only times these remarkable
scores have been made in this gallery, and when it is considered that
the centre is only 114 inches in diameter, they will be doubly appreci-
ated.
E J Souby
The above scores were made at the new 32-yard range just com-
pleted.

COMPANY B.—Tenth Competition lottery match, Co. "B," 12th Infourty, at the Armory, Feb. 11, 1882,
Private A Kingsland.

5, 4, 4, 5, 5, 5, 4, -3, 3, handicap 1—3, Private A Kingsland.

5, 4, 4, 5, 5, 5, -3, handicap 1—3, handic

BOSTON, MASS. Feb 20. The conditions were quite troublesome the wind blowing from about due north, and the light was excessively glaving. The scores mule in the verious matches shot are appended:

MINNEAPOLIS, Minn. Feb. 16.—The regular weekly shoot of the rifle club was held yesterday at the range near the university in anticipation of the match which will come off at the range near Wednesday afternoon between teams from St. Paul and home club. Following is the score at 200 yards, off hand, the best possible score being

fifty points:		
Mawdlin.		Libby
Skinner	41	Quain4
Gallison		W. A. Williams 3
Hoblitt		II. A. Stilson
Gibbs		R. H. Stat: 2
Hankinson	12	P. O. Quam2
Weeks		
		. b

Much interest is taken in the match to come off next Wednesday, and as the St. Paul team were beaten last Washington's birthday, the boys feel pretty certain they can down them again this year. The six best shots above will constitute the team.

six best shots above will constitute the team.

A NEW PISTOL.—The English Government, according to a London paper, is making some experiments looking to the use by the army, navy, frish constability, and other government service, of a new weapon, the mitrallicutes pistol, in which there are four barrels, which are loaded at once by a patent quadruple cartridge big enough to afford good hold to the fingers. Forty shots per minute can be discharged, and the empty cartridges ejected automatically. As there is no opening through which any gas can escape, the weapon can be put to the shoulder when atiming, and there are no screws, hamers or projections to catch the clothing, refas or accourtements. Above all, there is no fear of o jam or the weapon becoming unserviceable from overheading. The pistol will take the ordinary government cartridge.

ment cartridge.

ZETILER RIFLE CLUB.—New York, Feb. 14.—Fifth competition for the gold match. Creedinoor targets, ten shots per man, possible 50, gallery distance: C. G. Zettler 49. M. Dorler 48, J. Levy 48, C. Jud-50, T. H. Hoiges 47, M. B Engel 47, D. Miller 46, B. Zettler 46, M. Kilan 49, A. Lober 49, J. O'Neil 18.

DELAWARE AND MARYLAND.—Philadelphia, Feb. 17.—I hand you herewith score of an interesting match shot yesterday at Elkton, Mill., the rival parties being respectively of Delaware and Maryland. Conditions of match 25 birds each man, 1974s. race "Incomment were outbinded, otherwise hie result might have been different. Their summittion evidently bad not been properly locked after, for Holmes electely hit every bird he shot at. Williams is a good detau shot, bolng well up in the sclence of shooting, all of them being counted No. 1 duck-shooters. Score:

Detawa				
Radeliffe, Milford 19011	11110	01011	11111	11111-20
Holmes, Dover	00111	01111	01011	11111-16-36
Maryla	ınd.			
Williams, Port Deposit11111	11111	10011	11110	11111-22
Barnes, North East	01111	1000	11110	01011-17-39
I may add that Barnes was trouble	d with	a stiff	neck	from a boil.

I may add that Barnes was troubled with a stiff neck from a boil, and may not have been at his best, while Radeliffe was shooting an over-loaded light nuzzle-loader, which placed him at a disadvantage; notwithstanding which he made the best straight score. With some coaching and practice he would make a hard man to beat,—W, H. W.

ALGONQUIN GUN CLUB.—Regular semi-monthly contest, Feb. 14,

Wm E Fitch, Bal S. G H Charles, Bal S. C White, Bal S. S B James, Bal S. R J Willis, Bal S. S O Long, Wes S. Seventeen thiplicate scores were made.

S O Long, Wes S Seventeen duplicate scores were made.

Seventeen duplicate scores were made.

SetHUTZEN NOTES.—The regular annual general meeting of the Newark Shooting Society took place January 17, 1882. The meeting was well attended. After the reading of the minutes the Board of Directors presented to the assemblage their report for the year 1881, in which social, as well as financial progress was stated. After the reading of the report, which was adopted with approbation, the officers and directors for the year 1882 were elected as follows: President, Followish and the state of t

the same conditions, to Messers. Charles H. Wagg and Gustav Meister, as the highest bidders.

THE NEW YORK RIFLE CLUB held their regular monthly meeting last Thursday evening, at which there was a good representation of the members. After electing sixteen new members and transacting other business of importance, the meeting adjourned, but at the request of Capt. F. J. Donaldson, they remained a few moments, and he then, with a neat little speech, presented to Sergeaut T. J. Dolan, of the little Regiment, the prize which he had won in the Secretary's elegantly engraved and suitably inscribed with the name of the whiner and that of the donor, Capt. Donaldson. There is now progressing at the club a Surprise Match, during the month of February for twenty prizes. The question is, "What are they?" No one knows, They are all to be done up as nearly alike as possible and each man, according to his score, is to draw one. Thus the poores, score may draw the best prize. This keeps up the excitement and the numbers are hard at work putting up big scores. We congratulate the club on its prosperous condition and increasing membership. Their rooms are finely fitted up and the members are ever pleasant and contreous.

NEWARK.—The third tournament of the Newark Central Rille As sociation takes place this week at the Plymouth rille range, 544 Broad st., Newark, N. J. The following clubs will compete: Essex, Colimbia Plymouth, Frelinghuysen, Celluloit, Barmard, Warren and Amateur The entrance free is \$5 a. club. At the end of the tournament this money will be invested in three prizes for the three clubs making the highest score.

INTERNATIONAL MATCH CORRESPONDENCE.

INTERNATIONAL MATCH CORRESPONDENCE.

THERE is a determination on the part of our American managers to 'buildoze' the English ridemen into a cast-fron promise to send a team over here in 1885. It begins to look very much as though through much insisting on this point the entire match will be staughthrough much insisting on this point the entire match will be staughthrough much insisting on this point the entire match will be staughthrough much insisting on this point the entire match will be staughthrough much in the match will be staughthrough much make a managera; I man a match and the match in the following letter which was recently sent to the British Committee:

New York, Feb. 10, 1882.

My Dear Stra Herry—In my former letter I did not explain fally our views in regard to the importance to us of a return match, but will endeavor to do so now. The value of an international cotappetition of either country lies in the increased interest that it will develop in rifle shooting among its citizen soldiers. As I presume you are aware the number of those in this country who have show with military ritles at ranges over six hundred yards is very few, and these lew rice confined almost entirely to Creedinder.

Of the team is so short that a general practice for places can hardly be expected. Consequently the number of competitors will be few and the team itself cannot reasonably be expected to be a part.cularly strong one. Neither will any particular interest in military shooting be expected to result from its selection.

But if it understood that a return match in 1883 will follow, the National Guard of the various States will prepare themselves vigorously to be properly represented upon it and their general shooting be greatly improved. Our National Rifle Association and the general shooting be greatly improved. Our National Rifle Association and the general shooting be represented in the stranger of the properly represented upon it and their general shooting be a march should be represented and the same and the sol

THE WIMBLEDON RECORD.

THE WIMBLEDON RECORD.

The only match on the Wimbledon common meeting which corresponds with our proposed International Military match is that known as the Queen's prize context. This is in two stages. For the first stage any volunteer may enter, and the shooting is over the 200, and 600/ds. ranges, 7 shots at each range, making a total possible of 105 points. The sixty marksmen leading the list are then permitted of 105 points. The sixty marksmen leading the list are then permitted making a similar possible total of 103 points. It was in 1876 that the circular subdivisions on the targets were introduced, and in that year the short range target had a bullsaye of 8 inches in diameter, a centre of 16 inches in diameter, an inner of 22 inches, and a general field for 164 inches diameter. For the n.id range target the sizes were a bullsaye of 22 inches diameter. It should be remembered, too, that at 220/ds, the prone position was allowed. Under of 54 inches, and an outer of 70 inches diameter. It should be remembered, too, that at 220/ds, the prone position was allowed. Under the context of 164 inches are consistent was allowed. Under the context of 165 inches and an outer of 70 inches diameter. It should be remembered, too, that at 220/ds, the prone position was allowed. Under the context of 165 inches and an outer with 73 points. The long range targets at the second stage being the same as those now in use. In 1876, with the same target configuration, the first stage was won by Olley, with 85, and the second stage by Pullman, with 74 points. The pear 1877 saw a shifting on the matter of targets at 300/us; the bullseye was 6 inches in diameter, with a centre 12 inches in diameter, an inner of 24 inches, and an outer covering the remainder of a lawfit, larget slab. At the 300 and 300/us, ranges, the figures were for ever, in men of 24 inches, and an outer covering the remainder of a lawfit, larget slab. At the 300 and 300/us, ranges, the figures were for ever, in fact, and the research anged. The leaders in that ye

stood, Mac Donald, with 96 in the first stage, and Taylor, with 83 in the second.

The year 1880 saw time shooting in the first stage, when Scott totaled 102 in the possible 105, and in the second stage Ferguson reached 74. The improvements were due in large measure to the activation of the council. Last year the leading man at the first stage was Major Pease, with 96, and at the second stage, Private Beck, another Devon mian ted with 86.

In mikking estimates from these figures it should be borne in mind that they represent the supremess effort of a great company of shots, and that the fajl is quite marked even within the next few scores,

A WILD FOWL CANNERY.

A N enterprise which is now being undertaken in a small way in the South, but which, if not checked in time, may assume alarming proportions, deserves immediate legislative attention. Our readers will remember that not long since our Sacramento, Cal., correspondent spoke of the proposed establishment in California of a quail cannery, and we have now to chronicle the fact that a man in North Carolina proposes to establish a cannery for wild fowl. As yet the project is in its infancy. The individual alluded to has a portable oven in which he bakes the flesh of the canvas-backs, redheads and brant before sealing them up for market. With his batteries he secures great numbers of fowl, and it is said that next season he proposes to conduct his operations on a much larger scale, and that he believes "there is money in it." It seems scarcely necessary to point out the atrocity of this proposed scheme, nor to urge upon the citizens of North Carolina and the members of clubs who own property in that State the importance of using their influence with the Legislature at its next session to have a bill passed prohibiting

the destruction of fowl for any such purpose.

The game laws of many of the Southern States are in anything but a satisfactory condition, and unless steps are speedily taken to revise them, we feel sure that their citizens will have cause before long to regret the neglect. It is becoming the fashion now to go South in winter for the shooting, but this will not continue long after the supply of game birds shall have become sensibly diminished. In many of the Southern States it is at present legal to shoot quail all through the year, a practice which cannot but have the worst possible effect on the supply of birds. Other varieties of game are scarcely better protected. The influx of Northern and Western men into the South in winter is certainly a good thing for the sections which they visit, if for no other reason than that they bring in money and stimulate trade. Of the higher and still more important view of the case, the establishment of pleasant acquaintanceships and of kindly feeling between men of different sections of the Union, we need now say nothing. We cannot urge too strongly upon our Southern readers the importance of taking action upon this matter at once and in earnest. It touches them far more nearly than it does us, but our interest in it is not less strong than theirs. Let them be wise in time.

When it is permitted to shoot quail, deer and turkey at all

scasons of the year we cannot feel surprised that game grows scarce, and already complaints are beginning to be heard from certain sections of the South that the shooting is not what it used to be. In the old ante-bellum times the hunters were few compared with the whole population; but at the present time almost every man and boy in the South owns a firearm of some description. The havoc created by these home gunners, in addition to that made by the strangers, who come in after the shooting season in their own States has closed, will surely tell on the supply of game in the Southern States, bountiful and never failing as it may now appear to be. If action is taken by the different State Legislatures in time, the evil day-when game shall be as scarce in the South as it is now in the North-may be indefinitely postponed; but if no laws are passed, we must either see the game exterminated or else must recommend to landholders a general posting of their property.

We have no doubt that the wild fowl canner above alluded to will be obliged, in one way or another, to abandon his scheme, even though "there is money in it." The Legislature will, undoubtedly, attend to his case very promptly; but even if that body should fail to perform so plain a duty, which we cannot believe possible, the local gunners will, no doubt, drive him off so soon as his intentions become generally known.

MUSEUMS OF ARMS.

IT would naturally be supposed that in such a country as this where so much and such rapid progress has been made in the matter of small-arm manufacture, the history of the movement from the old-fashioned flint-lock of the Revolutionary epoch to the latest breech-loader, could be read in some fine museum of arms. Such, however, is not the case, neither in this city nor at the seat of government in Washington, nor among the workshops of the East can any presentable display of firearms be discovered. There are collections of military bric-a-brac, of army-junk, but nothing which is of any value to one desirous of seeing the progress made and the products of inventive genius in the way of these smaller weapons.

As a rule, army officers are lamentably deficient in a practical knowledge on this part of their duties. They are poor marksmen as a general thing, and in the practical knowledge of firearms of the smaller grades are woefully ignorant West Point does not boast of a collection of models or samples to show what there is new and what efforts have been made in bringing about the present service arm, and after the young lieutenant gets into service, he knows only the arm that is issued to himself and his men, and in the majority of instances does not seem to think it worth his while to waste time, expend effort and burn powder in mere practice at the target.

In New York city the United Service Institution has a museum at its rooms on Governor's Island, but it is almost entirely a collection of relics of odd and quaint bits of rusty accoutrements gathered up at a safe interval of time there after, upon the spot where some great battle had been fought. Battle flags in tatters and scabbards that have lain underground for many months may be very cherished mementoes of important events, but they are not the subjects to take as models in making new designs, nor are they of much use in studying the progress of inventive art. In Washington there is a collection somewhat after the same order at the Navy Yard, and another gathering of similar odds and ends at the War Department. Here and there a fragment may be seen which is worth some study, but on the whole the articles gathered are only worthy of a corner in the grand museum of historical fragments which the United States of America ought to possess.

The collections of arms made by the various official examining boards would in themselves make a very excellent nucleus for such a display of perfected arms, effort in invention, and products of the armorer's skill such as we have There have been several such special commissions composed of officers who have made themselves familiar with the subject, and they have published reports, with very carefully drawn plates of the arms submitted for testing and their several parts; still the arms themselves, to be handled and examined by actual manipulation, would be an invaluable adjunct to the understanding of the plates as published.

The collection, too, would be of interest, in a general way, as showing what enormous strides have been taken in securing at once portability and accuracy in these classes of arms. To-day the United States army is not armed with the best rifle in the market, as it certainly should be, and it is quite as certain that the majority of the members of that army, rank and file included, are not aware of the fact.

In the matter of nistol models the want is still greater for models, and the collections are bare of anything save a few over-ornamented samples of holster blunderbusses, fit only to produce a sensation on parade. What has been discarded, and when the valuable features of our present most compact and accurate revolvers came into being, it is impossible to tell, save perhaps by a delving search through the records of the Patent Offices here and abroad.

With our whirligig system of office holding and vacating, it may perhaps be too much to expect anything like the technical display of firearms of which we have spoken. It would be comparatively easy now to form such a display, but every year of delay diminishes the chance of getting models and examples of the discarded weapons which should find place on its shelves

ÆSTHETICS OF ANGLING.

A NGLING "hath a devil of a fascination." It was a devoted lover of its charms, who, one bright morning when the wind came quartering exactly right and the ripple was just high enough, shouldered basket and rod and went away to his favorite pool, all forgetful of the fact that it was to have been his wedding day. What consternation there was, when no bridegroom appeared at the appointed hour and place. What hurrying to and fro, what whisperings and surmises, until some friend, understanding his laudable weakness, ventured to suggest that the absentee had gone a-fishing.

The idea was scouted by those who were ignorant of the enticing powers of a morning when the angler recognizes all the signs as being auspicious of a plethoric basket. It was with doubting hearts that they followed up the trout stream until there he was, playing a fish, when the angry voice of the was-to-be-groomsman brought him to a realizing sense of his neglect of the one he loved. "Heaven forgive me," he cried, but wait until I land this fish and I'll explain all."

The explanation was consistent enough, and nothing was casier than a complete adjustment of the mistake. Her father was a gentle angler himself, and the daughter had seen the good influence that a love for the sport engendered. Like the sensible woman she proved herself, she recognized the fact and was willing to acknowledge that in angling she had a formidable competitor for the love of her husband, and as that was the only thing that could allure him from her, she

Angling is replete with attractive elements, but it is a genuine inborn love for the sport that impels its devotees to give time and money that they may indulge that love. There is no chance for display as there is in shooting or riding, or rowing. Be one never so skillful, his skill is not known outside his craft. The expert with shotgun or rifle or oars commands the applause of the crowd, while the angler, no less proficient in his chosen recreation, must content himself with doing his work quietly and alone. He never performs for outside effect. He has no audience to applaud him. His sport is quiet and gentle, lacking in everything showy and impressive to the vulgar, but he knows there is something to admire and applaud in the manipulation of forty feet or more

Fly fishing requires, nay, demands, one to be æsthetic in his tastes, and if he is not that he will become so in the company of the genial sportsmen who are facile princeps in the peaceful art. The implements he uses inculcate a love for the beauti-They are beautiful to look upon and admirably adapted ful to their purpose. Delicate, yet containing, when properly managed, an amount of hidden strength surprising to the

In the repairing and tying of his flies, he attains a nicety of touch and displays a rare knowledge of color and form, for he has often to experiment with a variety of allurements, and the product of his study may be a fly with no parallel in nature, one tied in bold defiance of entomology, yet effecting a better result than would obtain by conforming to some recognized copy.

There are no mean animosities engendered among anglers in camp. They are invariably willing to assist their brethren of the rod in every way to augment their pleasure, comfort and success. Scores of men go fishing who, if they gain some knowledge of a hidden pool where the fish are exceptionally large and plenty, keep their discovery locked up; but these men are not anglers in the true meaning of the word. They occupy a place between the sportsman and the pot-fisherman, with a decided leaning toward the latter.

It is a recreation full of sweetness. It invites one to serene enjoyments and contemplative repose, and the angler yields to its beguiling influences. He gathers inspiration from the infinity of delights with which the earth and all its surroundings are laden; idolizes the wonderful works of the Creator, whether it be the birds as they pour forth their songs of sum mer joy, or the golden buttercups and purple pansies that patch the hillsides.

The hills that stretch away in lines of undulating beauty, the new born day tipping the mountain top, the clouds with their ever varying shapes, the trout streams dancing and sparkling, leaping and tumbling over moss-green boulders, coursing over pebbly beds, the placid lake cowering snugly under the black and blue hills are mines of pure delight to him who loves the swaying rod.

When the mosquitoes sound their trump of menace and defiance and commence to bore away with all the enthusiasm of their forefathers, he employs no unparliamentary language to express his disapprobation of their infernal heniousness, but, childlike and bland, he puts on another coat of oil and tar, greets them with a smile, submits to their visits with Christian resignation, and smashes them with a laugh

MILLARD

A NEW MAP OF NORTHERN MAINE.-Mr. Thomas Sedgwick Steele, author of "Canoe and Camera" and other works, has just compiled one of the most satisfactory maps of the great canoe tours of Northern Maine yet published. This chart is 20x30 inches, printed on Government Survey paper, mounted on cloth, and is an invaluable aid to the sportsman tourist in these wild regions-in fact, to such an individual it is a most necessary adjunct to the economy of his camp From the extreme lower portion of the map covered by Moosehead Lake diverge the great rivers of this vast wilderness, the Main St. John, Aroostook and east and west branches of the Penobscot, while a portion of Canada on the north and New Brunswick on the east is embraced within its boundaries. Great care has been exercised in noting many points along these routes, which, although of the greatest importance to the canoeist, are seldom brought within the scope of the ordinary map. Along the Main St. John every log house and portage seems to be conscientiously indicated, while the many falls of the picturesque East Branch are noted, to the advantage and caution of the voyageur of these waters. After leaving the farms at Chesun-cook and Chamberlin Lake the tourist to the Aroostook paddles about two hundred uniles through the wilderness before reaching a sign of civilization, the first house being that of Philip Painter, while the second habitation, one mile further on, is that of William Botting, situated on the right bank, at a bend of the Aroostook River, called the Oxbow. Innumerable lakes and ponds are spread out before one on this chart like shot holes in a target. These and many other points of interest recommend this new survey of Mr. Steele to the camper-out in the wilds of Maine. The map is published by Estes & Lauriat, of Boston, and is mailed, postpaid for \$1 per copy.

Dogs and Railboar Charges -We received a call last week from Mr. Geo. G. Barker of Boston, Mass., who has just returned from a shooting trip South. He was accompanied by champion Princess, who is looking finer than we ever saw her appear before, Mr. Barker was the guest of Mr. Chas, S. Powell, of Smithfield, N. C., and reports a capital time, with birds fairly plenty. He is very enthusiastic in praise of the wholesouled hospitality that was extended to him, but complains bitterly of the extertionate demands of the railroad employes for the transportation of dogs. It is very singular that so intelligent and wide-awake a class of men as railroad officials are, should pursue the short-sighted policy that seems to obtain upon many of the Southern roads of charging sportsmen such exorbitant rates for carrying their dogs. They certainly lose dollars where they gain cents, for such treatment is soon noised abroad, and would-be patrons seek some other route. We trust that the time is not far distant when all railroads will adopt a uniform rate for dog fares that will be more commensurate with the services rendered, than the greedy demands of many of these harpies of the rail, who now have full control of the matter.

A NEW CEUE House .-- An association of New York gentlemen is now being formed for the purpose of securing a large tract of land in Pike county. Pennsylvania, and building there a summer club house. The location is four miles from Pine Grove, on the Eric Railway, and 415 miles from this city. The land comprises, we understand, about two thousand acres, with several ponds—Creely, Wolf, Tink and Weskaline--which afford good bass and pickerel fishing. is proposed to build a large club house with cottages sufficient for the accommodation of the members and their families. The location is said to be pleasant and healthful. The association has been organized by prominent professional and business man of this city. The membership will be limited to one hundred.

THE WELL-KNOWN firm of S. M. Pettengill & Co., advertising agents, whose establishment was totally destroyed in the late Park Row fire, have opened a new office at No. 263

EASY READING LESSONS-IV.

FOR THE LITTLE READERS OF THE FOREST AND STREAM.
Did you ever, my Dear Children, see a Dumphool? There is one in that Sail-Boat. He is writing his Name, and that of his Girl, with a Big, Blue Peneil, on the New Sail. How pretty it looks, on the Nice, White Canvas! What will the Skipper say, when he sees it? He will say "* * * * * ! ! _____! !

The Sportsman Courist.

A SONNET.

I SAW him oft, a man of quiet mood, Who loved to haunt the margin of the stream. Who loves to hather the integral of the stream.
There on a log, silent, as if a dream
Of beauty held him bound, near stream and wood
He patient sat for hours. Some time his look
Followed the flight of crane or water-bird: Some time he listened to the wind which stirred The forest trees, and their high branches shook

How often, wearied with the babbling crew Of men who throng the village streets and ways, Tired of contentions that amount to naught. Doth my soul sight of dwell beside the blue
Of mountain streams, to spend the happy days
Near waving woods that lead to quiet thought.

GAINESVILLE, Ark.

OTTAWA AND ST, MAURICE RIVERS.

BY CHARLES LANMAN.

THE rivers of Canada have a habit of being so exceedingly

fifty milec long, has some interesting falls, but widens into many beautiful lakes, all in a wilderness without habitations. And now we are in the capital of the Canadian Dominion, and a town of many novelties, the story of whose foundation is as follows: Late in the last century a man named Ruggles Wright from Massachusetts obtained a tract of land at this point, lying on both sides of the river, and deciding that the south side was unfit for settlement, fixed upon what is now called Hull as the site of a village and the centre of a lumbering population. In process of time, having to settle with one of his teamsters named Sparks for a trifling debt, he prevailed on the man to take, with some merchandise as part payment, the hills of the northern side of the Ottowa, throwing in a yoke of oxen besides. Years afterward, when the scheme was inaugurated for building the Rideau Canal, one day in 1823, Sparks was surprised to see a crowd of officers and soldiers in the act of taking possession of his sandy bluffs. They were under the command of a man named By, and wanted the property for the British Crown. The work, of a military character, which these men had in hand, began by the building of shops and shanties on either side of the hills; finally a bridge was thrown across the fall connecting Hull or Wrightstown with Bytown, and as the latter prospered the former remained stationary. Money flowed into the pocket of the owner, he sold lots and became wealthy, and the long despised hills were eventually decided upon by the Upece at the site of the Canadian capital.

The city is divided into three sections, the upper, central and lower town, and like Quebee, chiefly occupies a lofty

Some wasting wombt back and copiet blooking.

OTTAWA AND ST. MAURICE RIVERS.

The controlling that the pre-which undertakes to describe for cleams is constantly compact for player to be played to the control of the problem of the p

Of course there is no end to the stories of adventure and romance connected with the Indians and the French fur traders, who have given a strange human interest to this region; and the only historical story that can here be chronicled is from the pen of Jean Charles Tache, and is as follows:

"In ascending the great River Ottawa, one has to stop at the rock of the high monutain, situate in the middle of the portage of the seven chutes, at the foot of the island of the Grand Cadumet. It is here that Cadieur's tomb may be seen, surrounded by a wooden railing. Each time the Hudson Bay canoes pass the little rock an old voyageur relates to his younger companions the fate of the brave interpreter. Cadieux was a roving interpreter, who had married a young Algonquin girl, and purchased at this portage fars for the traders. After a winter thus passed he ascertained that a party of Iroquois were waiting to pounce on the canoes. To prevent this, he and a young brave endeavored to inveigle the Iroquois into the woods, while the canoes descended the rapids, and by a circuitous route himself rejoined the voyageurs. He succeeded in the first part of his design; but when thirteen days had elapsed, and Cadieux had not been heard from, a party was sent to scour the woods, who found a small hut of boughs, and the corpse of the interpreter half covered with green branches. His hands were clasped over a large sheet of birch bark, on which was scribbled his tale of exhaustion, hunger and death. The piece of bark on which his death song was written (for Cadienx was a poet) was brought to the post of the Lake of the Two Mountains, and the voyageurs of to-day have set it to a plaintive melody, which is much in the style of the old Norman ballads."

But I must now pay my respects to the River St. Maurice, As the crow thes, the distance from the central part of the

ms deant song was written (for Cantenx was a poet) was brought to the post of the Lake of the Two Mountains, and the voyageurs of to-day have set it to a plaintive melody, which is much in the style of the old Norman ballads."

But I must now pay my respects to the River St. Maurice, As the crow flies, the distance from the central part of the Ottawa to that river is not great, but the reader must retrace the imaginary trip he has just made and pass with me down to Montreal and thence to Three Rivers, where we will have another talk about another of the wonders of Canada. This river waters a territory of more than fifty thousand square miles, which is exceedingly rich in forests of pine spruce and hemlock. It takes its rise in a spring lake four hundred miles from the St. Lawrence into which it empties by three outlets, and from which fact its only town of any imporance is called Three Rivers. In 1829 several commissioners were appointed by the Provincial Government to make a survey of the St. Maurice for the purpose, in part, of ascertaining the proximity of its source to the Upper Ottawa. They traveled in canoes and met with many interesting adventures, and I have had the privilege of consulting their reports in the Government Library at Quebec, where the officials take pleasure in extending every facility to those seeking information. In this old book I have found a few items about the Indians who formerly intabited the valley of the St. Maurice. They were not numerous even fifty years ago, and the pure stock is now well nigh extinct, and their decline has been in keeping with the gradual extinction of their favorite animal, the beaver. The superstitions which prevalled among these old Indians were somewhat peculiar, and they were more sanguine than many other tribes in regard to the efficacy of dremms. They allowed the visions of the night to influence their conduct in daily life, and nowithstanding their general docility they were sometimes induced to perform deeds of great barbarity. The purpose of a drem

sen from staryation. But these are exceptional stories, and by the Indians, generally, they are listened to with pain and indignation.

Another glimpse into the character of the Indian mand is obtained by this little story. They believed that among what they call the Carribou Mountains there once lived certain wood demons, and from the cave which was their special home, the screams of children were often heard. Their terrible sounds were undoubtedly in perfect keeping with the solitude of the land, but it is more than probable that the screams in question came from the great horned owls or the nighthawks which abound in the woods between the sources of the St. Maurice and Hudson's Bay.

The St. Maurice has many tributaries, and there is a kind of fascination in the very names they bear, some of which are as follows: Shawenegan, Matawan, Vermillion, Flammand, Mannonen, Wessonnean, Mekinok, Bostonnais, Croche, Grand Pierriche, Tranché and Windigo, as well as the Rat and the Ribbon, all of them flowing through a great wilderness, and only to be visited in canoes. Lakes are numerous, and in several places the immediate banks range from two hundred to a thousand feet in height. Their waters abound in various kinds of fish, and throughout the whole valley both large and small game is abundant, the furbearing animals affording constant employment to many men, who do their trading at the Hudson Bay Company's port at a place called La Tuque, located in the far north. But the crowning attraction of this river are the Falls of the Shawenegan, which are about thirty miles from the St. Lawrence, and in their grandeur are indeed well nigh as imposing as those of Niagara. Although located on the St. Maurice, they bear the name of a large river which empties into that stream just below the falls, thereby causing concusion in the mind of the tourist. The total fall of water is said to be one hundred and fifty feet, and during the spring freshets there are three distinct leaps, unconnected with each other, but meeting in one imm

voyageurs ready for an expedition, but he must be ready to live on hardrack and to sleep upon hemlock boughs, which, if he is a man of sense, he will enjoy. The torests abound with deer, caribon and moose, and good sport will reward the patient hunter. The latter animal is generally hunted when the snow is deep, and sufficiently crusted with fee to bear the weight of a dog, but not that of the moose. The temp after a mose may sometimes last for many days, and some of the best pictures of this sport, and of the scenery of this part of Canada, were executed by the late accomplished artist, C. Crieghiff, of Quebec. The contrast between the wild scenery and primitive life along the whole valley of the St. Maurice and the city of Three Rivers is striking to the passing tourist, but characteristic of this northern province. There are from foundries or "forges" now in operation in this vicinity, which were established by the French nearly one hundred and fifty years ago; the city is the see of a Roman Catholic bishoppic, and the Cathedral is claimed to be one of the handsomest in Canada; and an extensive lumber trade with the West Indies has existed here for many years. To all lovers of the picturesque who are sighing for "new fields and pastures new," I would say that a canoe voyage on the St. Maurice will amply repay them for all the inconveniences of a wilderness tour. of a wilderness tour.

GAME AND FISH IN TEXAS.

GAME AND FISH IN TEXAS.

THE letter of "Wells," of Pine Woods, N. C., in Forest AND STREAM, of Feb. 16, giving an account of his hunting "Trip to Texas," amused me not a little. He travels a thousand miles or more to have some sport with his gun in Texas, stops a few days in two populous prairie counties, don't find anything, of course; returns to North Carolina and reports Texas to be a mighty poor place for game! From the report which he gives of himself, he expected even to find game in the streets of Fort Worth—a city of 10,000 people, situated in a great prairie—bears, buffalo, deer, congars, hyenas, turkeys, prairie-chickens, etc. Of course he did not find them prowling about or feeding in the streets of the city; nather did he find them on the outskirts of the city. Taxinant county, of which Fort Worth is the capital, is a great rolling prairie, pierced by railroads in every direction, populous of formers, with very little timber except along the streams. There is no covert for game to hide in, and therefore there is very little there. Johnson county has similar conditions, except that the seream of the locomotive and thunder of the trains are not so generally heard over its rolling prairies. They are both very beautiful and fertile regions, but for going a-gunning in, they are among the last counties in Texas that I should think of. Indeed, I know on county in Texas which would seem to offer a less encouraging prospect to the sportsman than these two. The idea of traveling so far to o equaning, and then choosing such local. gions, but for going a-gunning in, they are among the last counties in Texas that I should think of. Indeed, I know of no county in Texas which would seem to offer a less encour-aging prospect to the sportsman than these two. The idea of traveling so far to go gunning, and then choosing such local-lities as the field of one's exploits, seems to us in Texas very

tities as the field of one's exploits, seems to us in Texas very funny.

Game is very abundant in Texas; to use a strange backwoods expression, "There's just oodles of it." If "Wells" had gone to Colorado City, on the Texas and Pacific Railroad, which he left at Fort Worth, he would have struck into a splendid game country, where he could have had his surfeit in short order. Deer and antelope are very abundant in that region, ditto wild turkeys; and in the proper season the Colorado and other streams swarm with geese, ducks and swans. I have often seen that river covered with these birds as far as the eye could reach. The geese are not confined to the streams, but waddle over the prairies in great flocks. Sand-hill cranes, in battalions and brigades, stalk over the prairies. In the rough hills are peccaries, ever ready to join issue with the adveoturous sportsman in battle. All, when you jump them it stirs the blood, particularly if you be not perched on the back of a fleet-footed horse, or have not a convenient tree to climb. Copgars and bears and wolves are also numerous, and jaguars, dangerous fellows when they get their dander up, are by no means infrequent. "Wells" need not to have gone so far as Colorado City to find plenty of game. I merely instance that point as one where he could have stepped off the cars and plunged at once into medius res. Deer are abundant within a few niles of Palestine, also turkeys and ducks, and squirrels without end. Squirrel hunting with a pretty little rifle, carrying a ball not bigger than a pea, is really interesting sport.

To my thinking there is no finer game country in the

keys and ducks, and squirvels without end. Squirrel nunting with a preity little rifle, carrying a ball not bigger than a pea, is really interesting sport.

To my thinking there is no finer game country in the world than the great alluvial plain lying along the Gulf in Texas, extending from twenty to sixty miles in the interior. In winter that region literally swarms with ducks, geese, cranes, curlews, sinje, and a great variety of other birds. Deer are by no meems scarce. It is indeed a regular sportsman s paradise, whether the gun or the rod he his favorite. The bays and bayous are very populous of gamey and toothsome fishes. About twenty miles east of Houston the Great Thicket begins, continuing to the Sabine River, and probably beyond. This is an immensely dense forest, with thick entanglement of jungle, penetrated by innamerable streams. It is full of deer, bears, wild-eats, coons, squirrels, ducks, etc. One would also think that turkeys would abound in it, but they do not, owing to the great prevalence of cats, occidits, weasels and other sly, predaceous varmins. These things are too much for the turkey, and he gives that great wilderness a wide berth. He will not stay where an enemy may lurk behind every tree and log, and where he has no safety either by day or night.

As for Bob White, I fear his utter extermination in the State anless the law-makers step in to preserve him. We have a number of worthless persons in Texas who provided where he have a number of worthless persons in Texas who provided when the has no safety either by day or night.

As for Bob White, I fear his utter extermination in the State anless the law-makers step in to preserve him. We have a number of worthless persons in Texas who provided when he has no safety either by day or night.

As for Bob White, I fear his utter catermination in the State anless the hw-makers step in to preserve him. We have a mumber of worthless persons not even leaving enough for "seed." We have some closes and inefficient law out hits subject now, and it

In your issue of Feb. 2, I notice a communication from Maj. II. W. Merrill, partially descriptive of Kinney county, and I beg leave to give you something additional concerning the western portion of the county lying on the Rio Grande and Devils rivers.

This portion of the county is very rough and broken by deep enions and ravines, furnishing a safe retreat for the different kinds of game that abound. Here may be found white-tailed deer, turkey, three varieties of quail, a few bears, panthers, and an occasional jaguar or leopard.

Devils River, the natural western boundary of the county,

is a magnificent clear, rapid stream, running between pre-cipitous bluffs, and over beds of gravel and solid rock, varying in width from two to three hundred feet. The chan-nel is dotted by numerous small islands covered with reeds, rushes and heavy coarse grasses, about which the cunning black bass delight to lurk.

Very little fishing has been done in this stream, and it is well stocked with the gamest of American fish, the black bass, not to speak of the perch, buffalo, blue cat and two varieties

of gar.

The fishing can be indulged in to the heart's content, the stream being peculiarly adapted to it. The angler can wade out in most any part of the channel, making long casts down among the numerous islands mentioned, the current taking the flies down stream, thus chabling bin to keep up the slack of his line and out of sight of the fish. The rushes, also, afford an excellent screen for the angler. The only drawback to the pleasure of fishing here is the voracity of the gars. They will take off your bait and frighten your fish away. The angler should supply himself with a good rifle, by means of which he can rid the streams of a great many of these pests.

these pests.

The railroad will be completed to this section on or about the middle of April. I know of no portion of the State that affords the lover of sport a finer field than this.

It is a delightful climate to camp out in, being dry, invigorating and very healthful. The elevation above sea level is about 950 feet.

Del Rio, Kinney County, Tex.

Der Rio, Klaney County, Tex.

It is selfish to have a good thing and keep it all to one'sself, so I will just inform my brother sportsmen through your columns that within three hours' sail of this city, which is now connected by rail with the centres of civilization, one may find all the year around fishing that cannot be beaten in the United States, and in the winter season wild fowl shooting that can hardly be equalled.

I venture to say that any day one may land at Corpus Pass, with a single rod and reel, a thousand pounds of game fish, and from seventy-five to three hundred ducks may be killed with one gun in the course of a day, almost any day one chooses in a winter. This without decoys and without a dog to retrieve.

Quail are abundant here, and turkeys, geese, and deer can be got in almost any quantity. I would like to see some sportsman, who fancies he knows how to land a big fish with a rod and reel, come down here in September and get the conceit taken out of himself and his tackle by the tarpum, which at that time keep the water in a perfect boil.

The great trouble with the sport here is, there is too much of it, and one soon loss his zest for it.

Only a few days ago I left one hundred and eighty ducks on the wharf for persons to help themselves.

The hotels here are good and prices not exorbitant, and it would really be a treat to many northern sportsmen to come down here either winter or summer and see how lavish nature has been to us.

Corpus Christi, Texas, 1882.

Matural History.

CRAFTY FEATHERED FISHERS.

CRAFTY FEATHERED FISHERS.

THE following speedy method of killing wounded wild fowl, which appear sometimes to be as hard to despatch as the traditional cat, was shown to me by a Rice Lake Indian many years ago, and I have practiced it with good success ever since. It is speedier in its action than either biting the head or neck—both of which performances always savored to me of barbarism, and are for many reasons objectionable—it is quicker death than wringing the neck, and does not distigure either the bird or its plumage in the slightest degree.

objectionable—it is quicker death than wringing the neck, and does not disfigure either the bird or its plumage in the slightest degree.

The Indian, when showing me his plan, picked up a wounded duck, and, pulling a feather from its wing plunged the quill portion of the feather into the duck's neck just above the sternum or breast bone, penetrating the cavity of the throat, and pulled it backward and forward once or twice in the manner of using the plunger of a syringe. A convulsive shudder of wings and body took place and all was over, the bird being as dead (according to John Phonix's description) as Julia's sister, and this method has never since failed of producing a similar effect when used by me. Of course, any sharp instrument would produce the same effect, but as you are always provided with a feather after shooting a duck, no necessity exists for encumbering yourself with any other appliance.

Regarding the capture of fish by the bald eagle, (*Indiana leucosephalus*) it is an undoubted fact that often a fish is obtained from the water by this bird, but he cannot fairly be said to catch fish in the sense applied to the ospray and kingfisher. A disabled or sick fish floating on or close to the surface of the water will be picked up by him, sometime-very eleverly too, and always by aid of the talons; but as for obtaining fish in the manner of the other two named birds, by fairly diving and securing his prey when under water, and submerging himself to do so, this is a feature that I do not think ever occurs. A stranded fish, or one struggling over shoal water, will be snapped up by him, but I am of opinion not otherwise.

During the last of the run of the oubchaus in Fraser.

not think ever occurs. A stranded fish, or one struggling over shoal water, will be snapped up by him, but I am of opinion not otherwise.

During the last of the run of the oubschaus in Fraser River, during the month of May last past, I saw within a distance of three miles on the banks of that river, I believe, more than a thousand eagles engaged in picking up the dead and dying fish floating on the surface of the water, and left aground by the receding of the tide. Never did I see a flock of gulls more numerous following a school of herrings than were the eagles at this place, but not one instance occurred of the bird diving for his prey. On salt water I have sat for hours and watched the ospecy fishing, to be systematically robbed and re-robbed by his white-headed cousin, but can record no instance of an eagle diving for a fish. On the particular occasion above referred to, I counted as high as fifteen eagles sitting on one small hendock tree; the river on both sides was lined with eagles in addition to those on the wing, and the Indians living here informed me that this state of alfairs had lasted for about ten days. On returning to this place, three days afterward, to secure some specimens, I was too late, as the outachan run was over, and not an eagle was in sight. A person who has not lived upon or visited this coast cannot appreciate the number of eagles that congregate where fish or other food is plenty—there is apparently no limit to their number.

A feature that is peculiar to the fish crow (Gircus caurinus) of this coast, and which must have been a lately acquired

custom, may be of interest to your readers. Belonging to the various ranches, mills, logging camps, Indian rancheries, etc., are large herds of pigs which, except when put into pens for a few weeks to fatten, derive most of their substence from beach combing. The salt water flats at low tide are covered with stranded fish, crustaceans, etc., and large heds of clams and cockles are to be found almost everywhere. The pigs repair to these beds at low tide, and are very dexterous in digging up the clams. During the digging the crafty crows seat themselves on the pigs' backs, Micawber like, "waiting for something to turn up" or be turned up. Sometimes each pig will have its individual rider, but if the flock of crows be large and the herd of pigs be small, then some of the latter animals may have all the way up to three or four crows upon his back and shoulders at one time. The pig roots up a clam, crushes it in his jaws, and drops it to the ground to divest it of its shell. A crow hops down, seizes either the whole clam or a portion of it, and flies away, or, perhaps, hops up again on the pig's back, and proceeds to devour the shellish, and after it is finished prepares for another sweet morsel. If a whole clam is rooted out without being crushed, and the crow succeeds in getting it, he flies away and proceeds to open it in the ancient and accepted manner, by dropping it from a height upon a rock, going higher and higher, if unsuccessful in his first attempts, until his object is finally accomplished. The most perfect friendship and good understanding appears to exist between the crow and pig, as no unscendy quarrels or differences of opinion are ever seen to occur. Whether the crow ermin or performing other kindly offices, I have never observed, but certain it is that nothing but the best kind of feeling seems to exist between the biped and quadruped when feeding together in this manner. As pigs were only introduced into this part of the world at a comparatively recent date, Master Crow has been an apt scholar in

THE SEAL ISLANDS OF ALASKA.

THE SEAL ISLANDS OF ALASKA.

A MOST fascinating work, issued by the United States Commission of Fish and Fisheries, is Mr. H. W. Elliott's "Monograph of the Seal Islands of Alaska," just published as a special bulletin. This is not surprising, since the history of these far-distant little specks of land on the broad ocean, the habits of the remarkable animals which inhabit them, and the economic value of their products lend to them an almost absorbing interest even to the most careless reader; and Mr. Elliott, who knows more about these islands than any one else, knows, also, how to write about them in a very pleasant and attractive style. Besides this, he is an artist of very great talent, and his work is generously illustrated with sketches, which give a far better idea than any word-pairting could of the modes of life of the creatures he depicts.

The subjects treated in this monograph must be given in order to enable the reader to form any idea of its completeness and the breadth of its scope.

The geographical distribution of the fur seal is first taken up, and this is followed by a history and description of the Prybilov Islands and of the natives, the Alaska Commercial Company and its business. We are then introduced to the seal life on the islands, are given a life history of the fur seal, the method of taking, caring for and shipping the skins is described, and the economic value of the skins, oil and flesh of the animal discussed. To the natives of these islands the seal lion comes next in importance to the fur seal, and its life, history, mode of capture and economic uses are now described. A chapter on the walvus follows, after which is one on the reproduction of the fur seal, sea lion and walrus, Under the heading, Illustrative and Supplemental Notes, a great variety of subjects, geographical, biological, linguistic and economic, are discussed. We are given catalogues of the mammals birds and tables of the group, with some notes on the invertebrates and plants, all of which are interesting.

A reca

most of whom this animal is but little known. Mr. Elliott says that:

First.—The earliest bulls land in a negligent, indolent way at the opening of the season, soon after the rocks at the water's edge are free from ice, frozen snow, etc. This is, as a rule, from the 1st to the 5th of every May. They land from the beginning to the end of the season in perfect confidence and without tear. They are very fat, and will weigh, at an average, 500 pounds each. Some stay at the water's edge; some go to the tier back of them again, and so on until the whole rockery is mapped out by then, weeks in advance of the arrival of the first female.

Second.—That by the 10th or 12th of June all the male stations on the rockeries have been mapped out and fought for, and held in waiting by the "see-catchic." These males are, as a rule, bulls rarely ever under six years of age; most of them are over that age, being sometimes three, and occasionally, doubtless, four times as old.

Third.—That the cows make their first appearance, as a class, on or after the 12th or 15th of June, in very small numbers; but rapidly after the 23d and 25th of this month, every year, they begin to flock up in such numbers as to fill the harems very perceptibly, and by the 8th or 10th of July they have all come, as a rule.—a few stragglers excepted. The average weight of the females now will not be much more than eighty or ninety pounds each.

Fourth.—That the breeding season is at its height from the 10th to the 15th of July every year, and that it subsides entirely at the end of this month and early in Angust; also, that its method and system are confined entirely to the land, never effected in the sea.

Fifth.—That the females bear their first young when they are three years old, and that the period of gestation is nearly

never effected in the sea.

Fifth.—That the females bear their first young when they are three years old, and that the period of gestation is nearly twelve months, lacking only a few days of that lapse of time.

Sixth.—That the females bear a single pup each, and that this is born soon after landing; no exception to this rule has ever been witnessed or recorded.

Seventh —That the "severatchie" which have held the

Seventh.—That the "sec-catchie," which have held the harens from the beginning to the end of the season, leave for the water in a desultory and straggling manner at its close, greatly emaciated, and do not return, if they do at all, until six or seven weeks have elapsed, when the regular systematic distribution of the families over the rookeries is at an end for this season. A general medley of young males now are free, which come out of the water and wander over all these rookeries, together with many old males, which have not been on senglio duty, and great numbers of the females. An immense majority over all others present are pups, since only about twenty-five per cent. of the mother seals are out of the water now at any one time.

Eighth.—That the rookeries lose their compactness and definite boundaries of true breeding limit and expansion by the 25th to the 28th of July every year; then, after this date, the pups begin to haul back, and to the right and left, in small squads at first, but as the season goes on, by the 18th, of August, they depart without reference to their mothers, and when thus scattered, the males, females and young swarm over more than three or four times the area occupied by them when breeding and born on the rookeriess. The system of family arrangement and uniform compactness of the breeding classes breaks up at this date.

Ninth.—That by the 8th or 10th of August the pups born nearest the water first begin to learn to swim, and that by the 15th or 20th of September they are all familiar, more or less, with the exercise. 'see-catchie," which have held the

with the exercise.

Tenth.—That by the middle of September the are entirely broken up; confused, straggling bands of females are seen among bachelors, pups and small squads of old males, crossing and re-crossing the grounds in an aimless, listless manner. The season now is over.

Eleventh—That many of the scals do not leave these grounds of St. Paul and St. George before the end of December, and some severing may be the stable of January. But

grounds of St. Paul and St. George before the end of December, and some remain even as late as the 12th of January; but that by the end of October and the beginning of November every year, all the fur seals of mature age—five and six years and upward—have left the islands. The younger males go with the others. Many of the pups still range about the islands, but are not hauled up to any great extent on the beaches or the flats. They seem to prefer the rocky shore-margin, and to lie as high up as they can get on such bluffy rockeries as Tolstoi and the Reef. By the end of this month. November, they are, as a rule, all gone.

Within the brief limits of this notice it is impossible to allude to many of the extremely interesting facts in the history of these curious pinnipeds which have been brought out by Mr. Elliott's careful painstaking and long extended observations. It is certainly true that to him we owe a very large part of our knowledge of the habits of several of the more important species of this truly remarkable group.

ENGLISH WIDGEON ON THE NEW JER-SEY COAST.

SEY COAST.

DURING the past two or three years several English widgeon have been killed by the baymen on the New Jersey coast, in Tuckerton and Big Bays, near Little Egg Harbor Inlet, but unfortunately no special value was placed upon them. The fowl were plucked and sold with the varied lot of ducks brought to the town, and thus valuable specimens were lost to the collector and ornithologist. It would seem from the manner in which the baymen spoke of them as "red-headed widgeon" that the birds were not of the greatest rarity in these waters. My man, Sam Smith, residing at Tuckerton, told of having shot two or three, the subject coming up directly after we had killed a pair of our own widgeon or bald pates that came to our decoys. I was asked by him if I had ever seen a red-headed one. I pricked up my ears immediately, knowing he referred to the English bird, and not wishing to have him think I would value very highly one of these rare visitors to our shores, soon learned by indirect questioning all I desired. At Tuckerton a Mr. Kelly purchases from the market shooters all the fowl killed by them, and ships them to New York. Most frequently the ducks are plucked, as the same price is given for them with or without their feathers, and the gunners gain the feathers for their wives.

I have known of other rare varieties of fowl having been shot at the pooluts mentioned—a Hutching soose by myself. I have known of other rare varieties of fowl having been

I have known of other rare varieties of fowl having been shot at the points mentioned—a Hutchins goose by myself, others by the baymen, only known to them as the "little goose" or "sedge goose," black brant, and several eider ducks. It would be well if collectors wishing rare birds or fine specimens of any of the varieties of water fowl, would put themselves in communication with Mr. Kelly and have him save such birds as were desired. His charges would be moderate, I am sure, and I doubt if they can be purchased as cheap in the large cities,

such birds as were desired. His charges would be moderate, I am sure, and I doubt if they can be purchased as cheap in the large cities.

Another most excellent source from which to obtain specimens of almost all the warbler tribe is to make the acquaintance of the keepers of the several light houses (the first-class lights, as the tower is higher) and get them to send the endless variety of dead birds that are so frequently found, in spring and autumn, at the base of the tower, having flown against the light during their light in the night. I expect to be brought to account for imparting this latter piece of information, for I am acquainted with one collector in particular who has obtained many valuable skins by this method; but as his cabinet is full to overflowing he should not object.

Howo.

A Pond with Varied Visitors.—A sora rail was killed in the month of November, on the borders of a mountain pond near Kresgaville, Monroe county, Pa. The same pond was visited by a flight of loons—not the great Northern diver—which remained but a day. A lone Canada goose was shot there also by Mr. Wells, of Curtinsville, Pa., a flock of golden plover whistled on its banks, and the only otter ever seen in the county was killed as it swam near the wooded shore. All this variety in the space of a week. The pond must have been situated in the direct line of the miratory flight of these birds, and being in an elevated country, it was visited as a resting place, for surely no attraction in the way of feed presents itself, except it may be the fish of its waters for the loon, and it would take a sharp loon to capture a trout, especially the trout of this pond.—Homo.

Spring Notes.—Slingerlands, N. Y., Feb. 20.—During the recent warm spell, Wednesday and Thursday last, blue birds made their appearance in the early morning, to the number of half a dozen, remaining about the place all day. Is not this unusually early for them to put in an appearance as far North as Albany?—C. A. Neide.

Game Bag and Gun.

"SPORTING NOTES IN NEWFOUND-LAND."

UNDER this title an admirable little work has just been published at St. John's, Newfoundland. The author, Captain W. R. Kennedy, R. N., senior naval officer commanding on the Newfoundland coast, has had three seasons' experience of sport in the colony. He is a sailor who has been all around the world, not "without seeing it," has shot and fished in every clime, and being a thoroughly good all-around sportsman, his opinion of the capabilities of Newfoundland, as a sporting country, must be received with the weight and respect which is due to a veteran deer stalker, a keen fisherman, and a first-class wing shot. Captain Kennedy writes as well as he shoots; to all the readers of Foiest and Stream, therefore, we cordially recommend the perusal of this little work, which has already reached the honor of a second edition.

of this little work, which has already reached the honor of a second edition.

It will interest alike the disciple of Izaak Walton, the hunter of big game, and the lover of dog and gun; even the stayathome sportsman, whose hands are innocent of blood, who has never felt the thrill of delight which the gunner feels at a good shot, or the angler experiences in the rush of a noble fish or the whir of the eel, will be interested in the stirring adventures "by flood and field" which the gallant captain has so gracefully described.

We select three short extracts, one on trout fishing, another on grouse shooting, and lastly the finest of all the sporting

so gracefully described.

We select three short extracts, one on trout fishing, another on grouse shooting, and lastly the finest of all the sporting scenes in this book, the deer combat:

"Selecting one of Farlow's lovely "silver doctors," I commenced at the head of the upper pool, whilst Jim fished below. About one-third down, a rise! and I was fast in a 3lb. trout, which was speedily landed, and, to cut a long story short, I took out of that pool before I left it eighteen others, averaging from 2lbs. to 3lbs. I then moved down to help Jim, who could not get his line out to the further bank where the fish lay; so together we went down to the rattle and the pool below. At this place we found the trout "jostling each other," so thick were they that, although there were salmon in the pool (we could see them), they stood no chance, as the more nimble trout seized the fly immediately it touched the water. For upwards of an hour the fun was fast and furious, as we generally were both playing fish at the same moment; the beach was sloping, gravelly, and clear of trees, so we gave them the butt freely, and after a few rushes hauled them out by the hair of the head! The strand looked as though a scine had been hauled, the speckled beauties of 3lb. to 4lb. lying about in all directions. At last the fish slacked off, as well they might, and we hove to for a cup of coffee which was being prepared for us on the bank. After a few minutes for refreshments, and to rest the water, we set to work again, but the trout had had enough of our flies. I rose a good salmon in the tail of the pool, and Jim hooked another, which he lost. We then fished the pool over again, with a small trout on spinning tackle, taking three brace more bifurout, after which I went up to the upper pool and took a

which he lost. We then fished the pool over again, with a small trout on spinning tackle, taking three brace more big trout, after which I went up to the upper pool and took a grilse with the fly, and half a dozen more big trout.

"It was now 3 P.M., and we had a long journey before us: so, putting our fish into a light skiff, which had been poled up whilst we were fishing, we dropped down the river, and then on board. Our bag weighed exactly 98lbs., out of which there were thirteen trout which scaled over 3lbs., and twenty-five over 2lbs. weight. Not a bad bag to be made between 11 A.M. and 3 P.M. I think after that I am justfied in stating that, with proper precautions and fair play, the rivers of Newfoundland would be second to none in any part of the world."

Captain Kennedy devotes but small space in his book to grouse shooting, a true Scot, "his heart is in the Highland chasing the deer." Caribon, "The Highland Chasing the deer."

of the world."

Captain Kennedy devotes but small space in his book to grouse shooting, a true Scot, "his heart is in the Highlands a chasing the deer." Caribou stalking is evidently his favorite sport. His short notes, however, on the sport over dogs on the Newfoundland barren are well put together and we can certify from personal experience that all he has written about this special expedition is critically correct. Grouse, or as they are all called partridge, are plentiful in the immediate neighborhood of St. John's, but the enormous number of shooters specility exterminate the broods, and after the first week in September it is necessary to go some distance from the capital to make a bag.

"A very pleasant expedition may be made in the direction of Salmonier, a pretty village some fifty miles to the westward of St. John's, where accommodation for a sportsman can be obtained at Carew's Hotel. The road is good and scenery beautiful throughout the route; and a stoppage may be made either at Topsail, twelve miles, or Holyrood, twenty-five miles, at both of which places a decent hotel is to be found. From Holyrood to Salmonier is twenty miles; at the latter place a few days may be pleasantly passed. The hotel, though unpretentions, abounds with good cheer, and Mr. Carew and his wife are obliging, and attentive to their guests. Fair sport may be had in this neighborhood with gun, rod or rift, according to the season. A snipe marsh lies directly in front of the house, and a salmon river, to use an advertising phrase, runs through the property. An aniateur sporting parson, who had never handled a rod before, hooked thirty grilse in rain sport him, the had made segmentation of the house, and a salmon river, to use an advertising phrase, runs through the property. An anateur sporting parson, who had never handled a rod before, hooked thirty grilse in this stream in one day last season. At the back of the premises, a few hours' journey through the woods, there is an extensive park or barrens whereon deer and wild gesee are to be found in the fall of the year. Leaving Salmonier one morning an hour before daylight, accompanied by an eathusiastic sporting J. P., we drove down by the river till we found ourselves abreast of a small fore-and-aft schooner at anchor some forty yards from the shore. Opening fire upon this craft with snipe shot to rouse out the crew, we managed after a few rounds to wake them up, and soon got aboard, and in a short time were scudding out of the harbor with a flowing sheet. A brisk N. E. gale carried us across the bay to a small park thirty miles distant, where we landed and conveyed ourselves and our traps to a neighboring farmhouse. We received a hearty welcome from our host, and indeed from all the village, the unsophisticated natives being unused to visitors, turned out en masse to meet us and gave severy information as regards sport. Curiously enough, these people all spoke with a foreign accent, rolling the 'tr' like a Frenchman, but with a rideulous mixture of Irish brogue as well. They declared the "patterridges" to be jostling each other on the barrens, and as for the salmon and trout, "begorra, yer honor, they're as thick as the sands of the say." The village was picturesquely situated in a valley, and unlike the generality of Newfoundland settlements, presented a well-to-do appearance. A lovely salmon river wound its course through the valley, dividing into several branches as it approached the sea, and variegating a considerable extent of rich meadow-land, which afforded pasturage for herds

of cattle and sheep; a considerable portion had also been devoted to agriculture. A barrier of sea beach obstructed the mouth of the river, causing at the branches to re-unite and rush through a gut of barachois into the sea.

"The afternoon of our arrival we ascended the barrens, at the back of the village, and bagged sixteen brace of grouse and a few snipe; the birds were fairly plentiful; the dogs worked well and the powder was straight. The next day and the next, we averaged ten brace per gun; and on the fourth we worked along the coast to a rendezvous where our boat had preceded us, and from thence re-crossed to Salmonier. Our bag (two guns) was sixty brace of grouse and snipe—not much to brag of in a country where game is preserved—but not bad for a wild country where the only protection the birds get is a close time during the breeding season, where every man carries a gun and vermin are encouraged for the sake of their skins.

"Walking on the barrens of Newfoundland is very much

sake of their skins.

"Walking on the barrens of Newfoundland is very much harder work than on a Scotch moor; but there is no limit to the extent of ground; it costs nothing; the birds when tound are magnificent; and when the sport is combined with snug quarters and kind-hearted hospitality, as in our case, it is not to be despised."

The best extract we have reserved for the last—the description of the combat of the three contents of the three contents.

are magnificent; and when the sport is combined with snug quarters and kind-hearted hospitality, as in our case, it is not to be despised."

The best extract we have reserved for the last—the description of the combat of the two stags: "Refreshed by a soothing pipe we proceeded cautiously along, looking out for deer, when Reuben exclaimed, "Look, Captain, big stag," as a gleam of sunshine lit up the snow-white side of a noble beast. The big stags at this season are almost white, their necks-entirely so. The deer was hurrying along, evidently on the trail of other deer; we ran to cut him off, but he had already disappeared in the woods, so there was nothing for it but to follow on his tracks. At this the Indians are marvelously skillful; with eyes upon the ground, they follow at a rapid pace, noting every blade of grass pressed, every stone displaced, or mud stirred. The trail would have been casy enough to follow but for the numerous tracks of deer all leading down to the valley; and it was evident that a large company had preceded us, a fact of which our old stag was doubtless well aware. We struck down through some woods, picking our way by the "leads" or open passes, well trodden by deer, when I happened to catch a glimpse of some white objects in the valley below. A glance through the glasses pronounced them to be a "company" of deer, and although we could not make out a stag, we were perfectly well assured that one would be among them, and our old friend's hurry to get into the valley became apparent. Picking our way eautiously down through the wood, we at length reached the valley and found ourselves within a few hundred yards of the heart hind, but still no stag could we see. A blinding snow-storm now came on, and we waited to see how the cat jumped, when, looking back, we saw a splendid stag coming out of the wood behind us, accompanied by a hind. This was evidently the same fellow we had seen before, but we had reached the valley by a shorter cut, while he had picked up with a mistress on the way, and valley, as the two stags' heads met in the arcna. Now was our time; disdaining all notice of the hinds, we ran for the spot; the hinds seeing us running began to run also, not away from us, but with us, and in a moment the extraordinary sight might have been witnessed of some sixteen or seventeen hinds and three men all rushing along, mixed up together, to witness as pretty a fight as ever a deer-stalker beheld. In all my experience of deer-stalking, extending over many years, I never saw the like or expect to see again. There, amidst he blinding snow, were the two monarchs of the glen, their heads down, backs arched, horns crashing, turf flying; struggling, writhing, pushing for the mastery, while the hinds, for whom the battle was raging, and who had now arrived on the scene, assembled themselves around to see fair play. What the issue might have been it is difficult to say; the combatants were well matched as regards size and weight, but the new arrival was the fresher of the two, and had longer horns, while the owner of the seraglio, exhausted by the cares and anxiety attendant on his large family, was slowly but surely giving way, and would probably have eventually either been killed or forced to retire, when a third and common enemy arrived on the scene. Selecting the nearest beast, I fired right and left into his huge squirming body, while surely giving way, and would probably have eventually either been killed or forced to retire, when a third and common enemy arrived on the scene. Selecting the nearest beast, fired right and left into his huge squirming body, while B. simultanuously did the same with the other. The stags, which had paid no sort of attention to us, now separated; one reeled and made an effort to charge, but rolled over as a third bullet pierced his carcass; the other made off, but had not gone far before two more shots, fired simultaneously, dropped him also, and the two gladiators lay dead within a couple of yards of one another. Would that a Landseer had been there to picture that strange scene, one that will ever be impressed upon my memory, the grandeur of which was heightened by the romantic beauty of the place and the heavy snow-squall raging at the time. A moment later, and the scene changed from one of intense excitement to perfect calm; the squall passed, the sun shone out, the stags lay dead, with faces upturned to the cloudless sky, and the hinds had departed to seek for another lord and master.

We sat down to refresh ourselves with a pipe, whilst Reuben performed the last offices to the departed deer. It may be said, "What a pity you didn't wait and watch the combat," possibly we might have done so, but there was always the risk of their winding us, or being led off by the hinds, although I believe we might have sat down and watched them for an hour and killed them after all."

We believe it is the intention of Captain Kennedy to pub-lish a larger edition of his work at some future time, with illustrations drawn by the author. Copies of the present edi-tion may be obtained through the editor of Forest and

A RECORD OF WING-SHOOTING.

A RECORD OF WING-SHOOTING.

I BEG to present to your readers the following record of my wing-shooting during the past five seasons. My system is to keep score-cards in my pockets, and as soon as possible after making a shot I score a hit or miss. I also keep in my shooting box a Bogardus score-hook, and at night "post up" for the day. It may seem too much trouble, and it certainly is some, but a quiet determination and a little practice soon makes it come natural. It is better to count your shells before starting and again on your return. 'The sportsman must be careful not to shoot for a score, but let him adopt the principle of taking all his chances, and whether his card shows good or poor shooting he always knows that the score is a fair one; if good so much the better; if not, why long shots, out of range, bad light, unaccountables, etc. will easily explain how it was. I allow one barrel for each bird, but when a bird is shot down and has to be shot over I count but one shot. The gun used in 1877, "78 and "79 was a 10-bore, weight 91b. 60z., charge 4drs. to 5drs. powder, 14oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs., with 3\frac{2}{3}drs. to 4drs. powder, 14oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs., with 3\frac{2}{3}drs. to 4drs. powder, 15oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs., with 3\frac{2}{3}drs. to 4drs. powder, 15oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs., with 3\frac{2}{3}drs. to 4drs. powder, 15oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs., with 3\frac{2}{3}drs. to 4drs. powder, 15oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs., with 3\frac{2}{3}drs. to 4drs. powder, 15oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs., with 3\frac{2}{3}drs. to 4drs. powder, 15oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs., with 3\frac{2}{3}drs. to 4drs. powder, 15oz. to 14oz. shot. In 1880 and '81 I used a 12-bore. Slbs. shot. Slbs. shot. In 1800 and '81 I used a 12-bore. Slbs. shot. Slbs. shot. In 1800 a

The above is the exact reading of my score-book, and the reader may criticise as he chooses. Good, bad or indifferent, it remains my score as I made the shots. It includes both open and brush shooting at what are usually considered game birds. The smaller birds and birds of prey, etc., are not included. The writer could easily have increased the number of shots each season, but he does not shoot for "a bag," and is contented with moderate luck. On first commencing my system I was not careful enough about posting each day's work, and I lost nearly half a season's work by this neglect, but I do not do it now.

Now, as for loading, experience has faught me that for a

posting each day's work, and I lost nearly half a season's work by this neglect, but I do not do it now.

Now, as for loading, experience has taught me that for a No. 10 gun of say #lbs. weight, 4drs. powder, good powder, and 14oz. shat is the best charge, especially for long shots. My No. 10 has a 3-inch chamber, and I have to crimp considerable paper, but this in my opinion gives extra force, at least my experiments and my friends seem to warrant it, and I here beg to call attention to this as being of seeming importance. Another trial I made resulted in the best combined target and penetration that I ever saw. The charge was 5drs, and 14oz. of No. 7's, and the evenness of it was remarkable. It was the premier of hundreds of loads. Let some of your readers take a few long-length shells, put the above mentioned charge in them, and crimp all the paper down as tight as they can, putting two pink wads over powder and one over shot, and then send the result to this paper. I have found that the fuller the shells the poorer the effects, more especially in penetration. In my competitions between 10 and 12-bores, I have found that so far my present 12 loaded with 34drs, and 14oz. shot has produced the best targets so far as penetration goes, but in the field 4drs, and 14oz. has the lead. At a trial last spring one of my friend's No. 10 failed to come up in any way, although loaded with 5drs, and up to 14oz. shot, the No. 12, with 34drs and 14oz. beating it. We are to have another trial early this spring, and some new shells are to be tried, and I hope to chronicle it to your readers. I will conclude by saying that all my rewards have been the outcome of my own personal experience during many years.

Bosrov, Mass., February, 1882.

WHO IS RESPONSIBLE?

WHO IS RESPONSIBLE?

Editor Forest and Stream:

I have been very much interested of late in reading certain articles that have from time to time appeared in your columns in regard to game protection, and I was particularly interested in a communication signed "Ogdensburg" which appeared in your issue of January 26; and I fully agree with the writer in saying that the local game constable act is a failure, and I am not at this time prepared to say that the State game agents are not in the same category.

Now, the work of destroying nets in Oneida lake is all right, but there is some other work that, to my notion, needs looking after. In the city of Utica ruffed grouse were sold until February 1. This was all right if the birds were killed before January 1—but were they? A local sportsman of this village was in Utica, and seeing a large number of grouse displayed had his suspicions aroused, and on making cautious inquiries learned that if he would send in a few birds on the sly they would command a good price and be sold as 1881 birds. Now, the local sportsmen of Utica buy these birds, knowing that they must have been killed out of season; and, although there is a so-called game protective organization in Utica, it winks at these offences.

Again, in the village of Richfield Springs, a fannous sumer resort, are numerous hotels and restaurants. From July 1 till the hotel season closes woodcock and ruffed grouse are every day articles of diet. Where do they come from? Part of them are shipped there from New York city and the balance are killed by local market hunters within a radius of forty miles. Men are employed by the season to shoot game for the hotels, and a leading hotel man told the writer that during the month of July, 1880, one man killed 500 ruffed grouse and woodcock. After such slaughter as this, need we lay the disappearance of ruffed grouse to other causes than pothuming vandals does not understand the matter fully.

Let us look a little further. In Saratoga there is a repetition of Richfield, but on

sued.

Local clubs do not, as "Ogdensburg" supposes, always have game protection at heart. True, some of the members talk loudly and contribute liberally; but when one of those same men goes to Saratoga or Long Branch in July his first hotel order is for an "icehouse dinner," which in plain, English

means woodcock, ruffed grouse or other game that is out of

season.

Now, the great trouble in trying to enforce the game laws has been the fact that we have all the while been trying to get at the market bunters instead of the venders of the game after it is killed. If the market hunter cannot sell his game his vocation is gone, and he stops shooting. If our game protectors would bear this in mind and act accordingly they might be a power for good

tectors would bear this in mind and act accordingly they might be a power for good.

I hope that if thirty additional game agents are appointed that good men will be selected, and selected in proper localities, and while I do not believe that the selection should be left to local clubs, as "Ogdensburg" suggests, I think that leading sportsmen should be consulted.

As a result of close observation I will say:

1. That if illegal shooting is to be stopped, you must stop the sale of game out of season.

2. That a mean date should be fixed upon, so that the season will open on the same date on both ruffed grouse and woodcock.

woodcock.

3. That three months in each year is all the open season

3. That three monus in each year is another that should be allowed.

4. That the State game agents should be compelled to do their duty or be removed.

I hope other sportsmen will keep the ball rolling.

Brant.

Madison County, N. Y., February 20, 1882.

NOTES FROM KENTUCKY.

NOTES FROM KENTUCKY.

WE believers (?) in ground-hog day and similar forecasts of the weather are in a distressing dilemma. Our ground hog certainly must have been fearfully frightened by his shadow, and in view of the repeated snowstorms immediately following, not a doubt of his retirement for a six weeks' snooze was entertained, and scarcely were we reconciled to the fourteen more snowstorms to follow by anticipation of the long deferred ice crop, when on the morning of the 7th inst. a whippoorwill proclaimed winter over. The ground hog reappeared, doves began cooing, a rusty toad emerged from his winter quarters, and within the past week a gentleman found his terrier baying a black snake, which had taken a bush instead of a squirrel. The mercury for the past ten days has fluctuated between 50 and 70 deg. F. buds are swelling, peach trees nearly ready to burst into bloom, grass fields showing green, and numerous other indications that spring is not coming but here. We realize the fact that "all signs fail in dry weather." but the memory of few reaches accurately to that period, though there are traditional allusions to a drouth, and now the weather croakers predict that winter will begin about watermelon time, and that but about two small showers of this year's supply of rain remain for summer distribution. In view of this paradoxical state of affairs, you readily appreciate our "torn up" condition.

During open season such demoralization prevailed in the weather office that close season caught sportsman, gun and dog rusty, and small game is abundant. Ducks and geese failed to call, if they passed; not half a dozen deer were bagged in the county, and only the hunter who follows a squirrel dog has had any fun. Squirrels were never known so numerous as last fall and winter, except during occasional periods of migration. A neighbor and I bagged twenty-six one day in December, and at no point on our stroll were we exceeding a half-mile from the house. Within gunshot of the house we bagged soven within a circle of

minnows.

P. S.—This was written ten days ago, but couldn't get to office without a boat, and that anchored eight miles off if not carried away by floods.

MILL SPRINGS, Ky., Feb. 1882.

MIGRATORY QUAIL.

HAVE read the remarks on migratory quail of Mr. Everett Smith from Maine, and of Mr. Williams from Springfield, Mass.

Mr. Smith does not claim to prove more than that some of

Springfield, Mass.

Mr. Smith does not claim to prove more than that some of the quail returned; his evidence appears to be from correspondents, but as he is quite silent about the young broods of the returned birds, I conclude his measure of success is no greater than that of Mr. Williams and others, including ourselves. The "weak point" in this quail business is with the bevies or young birds. We have no right to expect that the old birds will return to the place they were liberated from any more than to expect that an escaped prisoner will return to his jail, but the young birds will have a "desire" to return to their native soil, and it is with them we have to deal and to facilitate this act of migration. In Canada "les perdirix" have young early in June, which is the commencement of our hot weather; by the 1st of September the young birds are barely fit to be shot, but by the 1st of October, they are quite strong and full grown. I infer from these facts that unless quail are turned loose in May there will be no birds strong enough that year to migrate with a hope of seeing them again the following spring, and that our failures with quail arise from the fact that we turn out the birds at the end of June instead of in the beginning of May.

Acting upon the above opinion, I endeavored to carry over my birds of last year so as to liberate them this spring, but I have only partially succeeded, as I have only six left. The mortality consists in "accidents" connected with cats, rats and escapes, all very trying to the temper, but forming a series of misfortunes which were not unbearable. The fault, however, arose from the nature and insecurity of the aviary, which was a temporary vard covered with rets.

series of mistortunes which were not unbearable. The fault, however, arose from the nature and insecurity of the aviary, which was a temporary yard covered with nets.

I, however, recommend an empty room with a net to protect the birds from hitting the ceiling with their heads, isay fastened about two feet from the top of the room) the windows to be netted off, and if plenty of sand is spread about the floor, I have no doubt that the iquail can be easily

wintered over, and that they would be fine strong birds by the following spring. The month of May is a good month in which to liberate quail in Canada, because our farmers are spreading grain over their fields, consequently there is an abundance of food, but in the United States the month of April would be preferable, in fact as soon as the winter is over the quail would thrive better in a wild state.

I intend to order two hundred quail again this spring, because the birds are hardy, cheap, and if I can establish them on the "jardins" of the Lawrentides they need not fear the domestic cat or the gun of the fowler, because the loup-cervier (lyux) and the hunter would not trouble themselves with so small a bird, and the former is a great enemy of the house cat. As to what becomes of the old quail, all we know is that they nugrate in the autumn about the same time woodcock and snipe disappear, but where they go to we do not know.

QUEBEC, Canada, Feb. 1882.

I have a lot of live quail in transit from Texas and will let you know about them in good time. By the way, I believe that all that has been said about the return of the migratory quail to the North is talk. We turned out 400 birds here in 1878 and 1879, 200 each year; and although they appeared to breed well enough, not one has ever returned to us. I do not entirely despair of them yet, but so far they certainly have not appeared.

RULLED, VL. Feb. 1882.

A LONG ISLAND QUAIL CLUB.

A LONG ISLAND QUAIL CLUB.

ONE years since—I believe in the winter of 1868—a friend sent me from Charleston, S. C., fifty live quail. The birds were received by me in December, and were kept until the following March in a small room. About the end of that month I turned forty-seven of them loose in a grove near ray house. Up to the spring named, quail had been very scarce in this acighborhood for several years, and I naturally watched pretty closely to see if my little colony of Southerners would increase and multiply, and—they did. One pair mated and produced thirteen eggs in a nest built within 300 feet of the spot where I turned them loose. This nest I took bodily, with the eggs in it, and a small white lautaun hatched every one of them. As for the rest of the quail, they screanded us all that summer with their sweet call, and besides stocked our neighborhood within a mile or two, so that for two seasons after we had very fair shooting. Since then the quail have been gradually disappearing about here, and now are so scarce that it pays no one to try for them. I am firmly convinced that it, say one hundred of our Long Island sportsance would stop talking about the "protection of game," and each and every one of them put his hand in his pecket for a ten-dollar bill wherewith to purchase a number of quail to tura loose in the latter part of March, the result will open his eyes as to what might be done in the way of restocking exhausted quail lands.

Would it not be a good idea for some gentlemen who have land, with a few dollars to spare over and above their champage bill, and who say they are interested in "Bob White," to form a quail club, each member of which shall hand over to the treasurer at least §3 to be used in the purchase of Southern birds for distribution among the members, pro rate; 1, for one, have §10 ready to be passed in, so soon as a strictly honest and sober freatsurer can be found. Thomas Claphan.

ROSLYN, Long Island.

NOTES ON SHOOTING.

NOTES ON SHOOTING.

WE take the liberty to publish the foliowing extracts of the form a private letter of an old and valued friend, who for some years has been debarred by illness from enjoying the dearly-loved sports of the field, or taking his usual active part in promoting the cause of game protection, and the improvement of the companions of our sports. In this connection we would say that a quarter of a century ago he imported from Scotland a "Blue Beiton" setter dog, and a year later a bitch, (from the Dake of Gordon's kennel, we think) whose progeny, both in looks and performances, would compare favorably with the blue bloods of to-day, we trust that our friend will soon favor our readers with his views upon some of the important questions that are from time to time discussed in these columns:

"When the great attraction and principal business of national, State and district sportsmen's conventions is shooting pigeous, and the game laws are ignored by those sworn to enforce them, as also by large numbers of the shooting fraternity, the interest in the preservation and protection of game, nearly or quite obsolete, has rather been waning for years. "Pools," "the pot," and kindred associations have little or no inducements for a class of gentlemen who love the gun, and whose aid and presence are valuable. "Gloan," Vol. 17. No. 23, says a good thing, as all his communications do. I wish there were more of them; they should be read and reread. I presume he may be thought "old fogy" with some of the rest of us. But mind you, his ideas will prevail or the so-called game associations will find their latter end soon. Another thing you know, I am no believer in "first-class" guns at \$50, or dogs at \$15 to \$25. "Loading" uppears the topic just now. Hardly two think alike. Fearing no one will agree with me I merely say, when a man has bought a gun and intends to use it, he can't spend a little time and money more advantageously than by going out and targeting with different charges, grades of powder, and bag of shot

MARYLAND.—Templeville, Caroline Co., Md., Feb. 18.—
The quadl and woodcock season closed in this county 15th inst., leaving us lots of quail for breeders. Owing to not much shooting being done around here the past season, I found lots of full coveys at the close of the season. The winter so far has been very mild, except a few cold snaps. We have had no snow of any consequence, so you can imagine how nicely the birds are doing. The woodcock have been conding on here very fast for eight or ten days; I have seen more here in the past week than ever before at this time in the year. They seem to be nesting, but I have found no signs, except that they are paired. I have made it my business to hunt for their nests, but in vain, Everything is favorable for lots of game next season in this part of the State.—W. G. Smith

EXPORTATION OF MICHIGAN DEER.

EXPORTATION OF MICHIGAN DEER.

Some particulars of the shipment of game out of this State in defiance of the law may be of interest. I will ry and give you a few facts. Large shipments of game across the lake from here to Milwaukee and Chicage were almost daily occurrences during the open season. There are a large number of boats called hookers that ply across the lake hesides the lumbermen's steam barges and seows. On these deer are shipped. Four were sent on one schoquer at once. More than fifty violations occurred here at Manistee alone. No one cares to bring down the curses of the people making these shipments by entering complaint. Then, the lumberman is the power that moves the people. Of the open violations in the close season one case will cover many of the same class. For several years it is said that a prominent attorney of Graud Rapids annually comes up north to fish and have some fun. Last season he was joined at Sherman by some local pot-hunters. They made their camp on the Betsy River. Some few deer must have been killed by them, as the men driving the river were compelled to stop work on several occasions and burn up the stinking carcasses of deer they had killed and left in the river to rot. The above are facts, and can be vouched for by Mr. Hopkins, justice of the peace of Springdole, and the foreman of the Island Lumber of the peace of Springdole, and the foreman of the Island Lumber of the peace of Springdole, and the foreman of the Island Lumber. On the land of the stand Lumber of the land of the stand Lumber of the land of the land and have two or the peace of Springdole, and the foreman of the Island Lumber. On the land of the land Lumber of the land of the land and have the peace of springdole, and the foreman of the Island Lumber of the land of the land of the land of the land and have land of the l

aguat on his lands, but buys his venison at two dollars per head, about two cents per pound. Ask him why he does so and he will say that pork hauled fifty niles or less is expensive. Mutton is cheaper and he don't have to haul it now. Some of these same lumbermen are members of game clubs: but then they are not to home.

A word about some of the mighty fishermen. While at Boyne Fells last June I saw Messrs. Portman and Kellog, members of the State Fish Commission, and they will vouch for this, namely, that the count fisherman took out of the Jordan and Boardman rivers trout that would average saventeen to the pound. And box after box of fingerling trout were shipped by these counters to their friends, to substantiate the wonderful lies that they would tell of their fishing on their arrival home. Is there no way out of this? Cannot some means be devised to exterminate these pudwhacks?

Manistee, Mich., Feb. 1882

BREECH vs. MUZZLE LOADERS.

BREECH vs. MUZZLE LOADERS.

SERIES of interesting articles have recently appeared in your excellent journal relative to the accuracy of rifles, muzzle and breech-loading, in which both have carnest advocates. They have endeavored to explain why the systems they prefer are most accurate; and yet there is an element, which so far has been entirely overlooked, and I believe explains the great results obtained by old style muzzle-loaders, as also the reason why modern breech-loaders in so many instances have fallen short of that nicety of results so many instances have fallen short of that nicety of results so many instances have fallen short of that nicety of results so much desired. I began by experience with a flint-lock small bore (140 to a lb.) with a barrel forty inches in length, and the rear sight situated as near to breech as was possible to have it. This rifle had a reputation for accuracy for many years, and had won repeated victories, which at last excluded it from other contests, as no one was willing to enter against it up to 70 yards. It was the fashion at that time to have the barrel of great length, and this style was continued until the breech-bading system was adopted. Makers of the latter at once shortened their barrels, and placed the rear sights farther from the breech, in some instances one-third the length of the barrel from the breech; and extreme accuracy was the exception instead of the rule. Long-range rifles with thirty-four inch barrels and rear sight on the grip or heel of stock have in their turn won victories which were deemed impossible, and can, without being forced from a fixed rest, place consecutive bullets in the bullseye at 1,000 yards, with so little deviation from a fixed point as to excite the admiration of the world.

bittle deviation from a fixed point as to excite the admiration of the world.

Billinghurse, Chapman and James, of New York, and Newcomb and Fitzpatrick, of Natchez, Mississippi, can and did make twenty-five pound rifles with telescopic sights running the entire length of a long barrel, which at 220 yards could place ten consecutive balls in a card 1% inches by 3½ inches and which (James' score) measured 9½ inches string measure. These results would seem to teach us that the greater the distance between fore and rear sights the greater the accuracy, and that accuracy is sacrificed by some makers of breech-loaders who place the rear sight (almost universally) one quarter the length of barrel from the breech. Not only does the short distance between the sights prevent that nice and close adjustment which greater distance permits; but the distance of the rear sight from the eye is another obstacle when the rear sight is so far from the breech. To sum up, I believe that given rifles of both systems, same calibre and powder charge, with front and rear sights same distance on each and barrels of same length, the results would be in favor of the breech-loader, from its superior excellence of inside finish which the muzzle-loading hand-hande rifle cannot possess.

But it you take the superior finished muzzle-loader of thirty-

not possess.

But if you take the superior finished muzzle-loader of thirty-four to thirty-six inch barrel with sights properly adjusted and compete with the breech-loader, short barrel and rear sight half way down the barrel, the result will be disastrous to the breech loader. A word sheat round balk in breech sight half way down the barrel, the result will be disastrous to the breech-leader. A word about round balls in breech-leader. A word about round balls in breech-leaders. I have faithfully tried for a long time with powder charges from 5 to 70 grains powder, round balls 145 grains, picked balls, 205 grains in a .45 calibre Starps military ritle, and distance from twenty to sixty yards, with such poor results that I would never risk a shot of that kind at any game. I patched the balls. I filled the shells full of wads and set the ball on top and inserted with greatest care, and they will strip every time; the twist of the grooves is too great, even when the balls are of pure tin or pure lead, or of any proportion of either.

of either. have loaded from the muzzle also and with same results. As a long-range rifleman I am perfectly femiliar with eve detail, and the extreme care necessary to produce unifor results, and this care I have given to the round ball; and the will not do.

ORLEANS, Lo.

Referring to my article, which you head "Muzzle vs. Breech-loaders," in your issue of February 23, you will notice that I used ammunition of my own preparation; and it is to this point that I wish now to refer, and state my belief that factory-prepared ammunition is not reliable for fine shooting. I note the article (following mine) by E. A. Palmer, and still further on the short one by "F. J." I had intended in my last to ask Mr. Van Dyke how a projectile that made an

erratic flight at short range would finally "bring up" in the bullseye at 300 yards and upwards? Like Mr. Palmer. I have made rifte shooting a specialty for long years; in fact, from boyhood it has been almost my sole pastime, till failing eyesight and physical infirmity has nearly deprived me of the pleasure. From long experience, if from no other reason, I must conclude that the rifle that will do steady, accurate work at long range will also do the same at short range. I have ever found it so. I have also owned rifles that would do good work at short range which at long range were totally unreliable. In this article I wish to refer to that of "Byrne," following third after that of Mr. Palmer. While I can indorse much that Mr. Palmer and "Byrne" say, and particularly the latter, with reference to shotgams and pistols, I must take exception to some of their rifle points. I do not believe that Mr. Palmer, Mr. Brinton, or any other man, can without flags on a windy day beat experienced marksmen who use flags. While I think that first-class breech-loading rifles, with properly prepared ammunition, will do as good work as muzzle-loaders, I feel just as certain that they cannot beat the muzzle-loader which is properly loaded.

If I were to shoot for a wager, I should take a muzzle-loader, but would make my own projectiles, select my own linen for patches, and also the powder. I once spent an entire day in New York city searching for suitable linen for patches, and only found one piece that was it for nice work. I could not even at Stewart's find a piece flat would stand the test of my "piek-glass," but did chance to find a piece at Lord & Taylor's, although my sample came from Stewart's a few months before.

Many fine rifle-shots know nothing about scientific loading. Perhaps "Byrne" may be one of these. I judge, at least, from the last paragraph of his article, that he has not enjoyed the pleasure of witnessing first-class practice, as he says he has not seen the man who could place ten consecutive shots in a spac

ally.

I presume that numerous readers of the Forest and Streem will recollect the company of sharpshooters organized by me at Buffalo, N. Y., during the fall and winter of 1862. At the same time an officer, who, to avoid dismissal from service, had resigned from Berdan's Sharpshooters, and was engaged in New York city in getting up a battallon of sharpshooters. Col. Berdan learning the facts reported the same to Secretary Stanton, who issued an order forbidding any mustering officer to muster into the corps of sharpshooters any person who did not upon test fire five consecutive shots within an average distance of five inches from the mathematical centre, in other words, make a twenty-five-inch string, and this at a distance of two hundred yards. This it will be observed would be much better marksmanship than "Byrne" ever witnessed, still, my company of eighty-three men compiled with the regulation, and their targels are on file in the War Department, each attested by two witnesses. The average for the entire company was twelve and three-eighths inch strings, being less than half the limits allowed by the "order." This will be seen to be an average of less than two and a half inches from the mathematical centre for each of the four hundred and fifteen consecutive shots fired by eighty-three different men from a half-dozen or more different States. These men were mustered into service by Captain Sheldon Sturgeon, First Infantry, U. S. A.

The shooting was all done from the shoulder, at a rest of course, and with several different trifles, some of which were presume that numerous readers of the Forest and

The shooting was all done from the shoulder, at a rest of course, and with several different rities, some of which were loaned by Dan B. Castle, the well-known Buffalo jeweler, who also dealt in second-hand rifles. Bome were also loaned by his neighbor Robson, the gunsmith. I will here say that Dan Castle and several friends of his, who sometimes had friendly trials of mark-manship with us, did decidedly better shooting than "Byrne" seems to think possible for any man to do

do. Referring again to Mr. Palmer's article, I will say that in Referring again to Mr. Palmer's article, I will say that in my younger days I too attended all the turkey-shoots within practicable reach. The last one was in 1865. A party of young men formed a sort of "syndicate" for the purpose of furnishing all the turkeys I was willing to shoot for at ten cents a shot, distance thirty rods (165 yards), nothing but the head to be struck. Four shots collapsed the syndicate. Each of the four shots passed through a turkey's head within one-half inch of the centre, and at the distance stated. This is also better than "Byrne's" allowance.

Wendam, N. J.

MILTON P. PETREE.

Mayonah, N. J.

Having read T. S. Van Dyke's letter on "The Rifle of the Future," and many letters in reply, and being a rifle maker of thirty-tive years' experience, I cannot stand around with my hands in my pockets and allow this discussion to go on without putting in a few words. I was pleased with the number of times that Mr. Van Dyke hit the nail on the head, and will show where he missed it on some points.

He did not seem to know that we have a perfect system of patching the extreme long ball for a muzzle-loader. We have a very perfect way of patching such balls, by using bond-paper cut in the form of a cross. When the paper is cut just the right size it leaves only one thickness of paper around the ball, and sheds from the ball when fired as perfect as when put into the guu. This paper is thicker than paper used for breech-loaders. The patent muzzle (to load with such patches) should be counterbored down about one-half inch, just enough to take out the grooves. This allows the patch to fold around the ball before putting on the guide starter.

Mr. Van Dyke traph were "The long worse rife over its."

the patch to fold around the ball before putting on the guide starter.

Mr. Van Dyke truly says, "The long range rifle owes its accuracy mainly to its ball being pushed in so far before firing." I think Mr. E. A. Palmer lost sight of this when he claims to have discovered his ready remedy (which has been in use for a number of years) for patching the ball to the old style breech-loader. Mr. Van Dyke appears to have understood this system very well, but he was speaking of the old style, soft taper bullet when loaded through the nuzzle like the old style muzzle-loaders.

Mr. Palmer has an idea that the more perfect the bullet after being fired, the more accurate it will shoot. This does not prove to be true with my experience. I often find that namy rifles shoot better to make the balls softer so they show the grooves more perfect, and also leave a distinct shoulder on the ball at the edge of the patch, which shows more

expansion by force of powder, but there is a limit in this

expansion by force of powder, but there is a limit in this respect to get the greatest accuracy.

Many people have a notion that the ribs formed on a ball by the rithing affect its accuracy by catching the air in its spiral motion. This is not so; the ball passes through the air the same as though there was a spiral passage cut for it. Old style, short, conical balls have to be much softer than those used in the long-range system, and consequently are found more imperfect and bruised after being fired.

The majority of target-shooters do not pretend that their short conical balls (which are the most accurate up to three hundred yards) will compete with a ball double their weight at one hundred rods. Mr. Palmer speaks of one Joseph Brinton beating so many of the old target muzzle-loading rifles in their farce shooting, as he styles it. The reason is plain to me why he came out victorious. It is a well-known fact that a ball three times heavier than balls used in the old-style target rifles will beat them in the wind at moderate long range. I presume that any of those old style guns used on that occasion would beat Mr. Brinton's breech-loader would make a much finer target than he could ever do with his breech-loader. He simply blazed away without using any of the engineering skill required to do good shooting with the old target rifle. He speaks of Homen Fisher being there with his pet nuzzle-loader. That may not be a criterion to judge by, for the question is, whether Mr. Fisher's rifle was made on the correct principle of a muzzle-loader, whether it was like those foreign muzzle-loader and on the same principle as the long range breech-loader, when the ball took the grooves by force of powder instead of being properly

made on the correct principle of a muzzle-loader, or whether it was like those foreign muzzle-loader, when the same principle as the long range breech-loader, when the ball took the grooves by force of powder instead of being properly fitted to the grooves by driving them through a contracted muzzle-piece with the cross-paper patch as herein described. In regard to loading a breech-loader at the muzzle to get greater accuracy, that depends entirely on how the gun is rifled—whether for round or conical balls. I could give many fine points on the subject, but I decline to do so, for I have a son who may work at the business after I am gone. I would have been about the first one to perfect the breech-loader if I could not see six reasons why one cannot be made to shoot as close as a muzzle-loader, I am in favor of a breech-loader where rapid firing is required; but for a target rifle they can never be brought to the same perfection as a muzzle-loader. I will explain to "F. J." one of the reasons why a gun will shoot well at long range and not at short range. It is known by many of our old target shooters that we cannot cast balls that are of uniform density on all sides. Swaging them does not change or break the crystal braces that are formed in the cooling of the metal. A ball that is weak, or less dense on one side, will not expand in line with the bore; the rapid wist required to use those long balls causes them to wabble, so the ball takes what might be called a spiral-parabola curve; its greatest distance from the centre would depend on how much it wabbled on the start; it finds its equilibrium before it gets 800 yards, and takes the true line of flight. A muzzle-loader can be made to shoot a very long ball much finer at short range than a breech-loader.

it gets 800 yards, and takes the true line of flight. A muzzle-loader can be made to shoot a very long ball much finer at short range than a breech-loader.

From my experience, the manufacturers of breech-loaders stand on the same grounds now that the makers of muzzle-loaders did thirty years ago. At that time an inferior rifle maker could make a gun that would shoot seven shots in ten as close as the best maker, but their three stray shots would measure about as much as the whole ten shot by the best maker. There are so many causes for those stray shots, that it requires a lifetime experience to make a rifle that will not make them far from the centre. I do not write this letter in the interest of muzzle-loading rifle makers, because with the bullseye measurement and controling interest in that class of make them far from the centre. I do not write this letter in the interest of muzzle-loading rifle makers, because with the bullseye measurement and controling interest in that class of shooting, there is nothing to be gained over the breech-loader at long range. But if they used string measure, (an average from the centre) the well-made muzzle-loader would beat the best breech-loader that was ever made. I don't say that many rifle makers could produce a gun superior to the long-range breech-loaders, for it is a well-known fact that we never had more than eight or ten in the United States that understood the business well enough to make a gun to any certainty. If there are any that don't believe it, let them inquire of some of the old crack shots, and not of those that have come up in the use of breech-loaders. I can show finer shooting done thirty years ago with guns made by a few makers, than can be done by any breech-loader of the present time; and I believe as Mr. Van Dyke says, that 'the man who has grown up with the breech-loader is only a callow youth, who knows nothing of what a rifle can do.''

If any man thinks he can make a very long ball shoot as close at short range, say 300 yards, as our short target balls, he will find his mistake after a few years' experience. A man who has had ten years' experience in rifle making, just begins to find out that he knows nothing about it.

Geo. H. Ferris.

I heartily sympathize with "Byrne" in his efforts to discourage the men who tell such marvelous stories of their skill with the shotgun or rifle. They are a social evil, but I think not a necessary one, and the best way to combat it which has ever occurred to me is to so enlighten the public mind in regard to the results obtainable in the use of frearms that unreasonable stories told of them will meet with discredit everywhere.

I believe few men will be found who care to relate their improbable years to a sudjence showing relainly that they

discredit everywhere.

I believe few men will be found who care to relate their improbable yarns to an audience showing plainly that they know them to be all "wind, simple wind." But I would like to caution "Byrne" on one point. I am afraid he has too little faith in the average rifleman's skill. His statement to the effect that he had not been so fortunate as to find a man able to place ten consecutive shots at 75yds, that would be covered by a saucer, even using a "dead rest," staggered me a little at first, but I soon recovered, and, firm in the belief that I could do that much myself, seized my little squirrel rifle and, tsking a 200yds, target reduced to 50yds, started out to see about it. I placed the target, measured off 75yds,, and, sitting on a stone, but using no artificial rost for the rifle, fired ton shots. I did not go to the target until the string was finished, when I took it home and measured up. Result: A string of 15y₂tin, average each shot from the centre, 1½in. A ring 4½in, in diameter encloses all the shots. Now, a common tea saucer measures 6in. in diameter, and will cover the ten shots, with 1½in. to spare. I enclose the target to give additional weight to my statement. The rifle used was a 28in. 22-cal. Ballard, with peep and globe sights. I am sure I can do much better with my pet target rifle—a new Maynard midrange—but all I care to do is to show that a person not by any means proficient in the use

of the rifle may easily do what "Byrne" thinks, or appears to think, quite a feat.

of the rine may easily do what "Byrne thinks, or appears to think, quite a feat.

Compare the above with the splendid score made by Mr. F. J. Rabbeth at Walnut Hill, recorded in Forest and Stream of January 26, and it sinks into insignificance. That gentleman, shooting with a "dead rest," placed nine out of ten shots, at 200yds, in the centre ring of the bulksye, \(\frac{2}{2}\) in in diameter, and the tenth inside of the \(\frac{5}{2}\) in, ring, all easily covered by a small ten snucer.

In this shooting, mirage and windage, two highly important factors in the riflemant's problems, enter; while at 75yds, both may be practically overlooked.

The best way I know of for a person to obtain a clear idea of what may be done with a rifle, is to learn the sizes of the rings on the various targets in use and their respective counts, and then read the weekly reports appearing in the rifle columns of Forest and Stream of the shooting done at the different ranges.

different ranges.

different ranges.

In this way a person may soon learn what the best marksman in the country are capable of doing; but, like "Byrne," he will never see the man who can hit a silver dollar every time at 75yds. off-hand. Let us have plain facts.

N. E. Maxson.

Westerly, Rhode Island.

Mr. T. S. Van Dyke writes in the number for Jan, 12
"the problem for the rifle maker of the future is this: How
to adjust the ball fully, firmly and gently to the grooves
before firing, and do it quickly enough to retain the great
advantage of rapidity of fire." To do this seems to me
simple enough. Any rifle in which the cartridge is not
pushed home by the thumb could be made to seat the ball as
well as a muzzle-loader, simply by shortening the chamber
for the cartridge so that the ball will be pushed into the
grooves of the rifle. There is plenty of the lever power in
rifles of the Winchester style to force a bullet into the
grooves, but the ordinary cartridge would hardly suit this
style of loading, because the bullet might, instead of going
into the grooves, get pushed back into the shell. Common
rim-fire factory cartridges would suit on account of the
bullet being firmly held by the extreme end of the cartridge so
that almost the whole bullet could be bedded in the grooves.

Glenford, Quebec.

GLENFORD Ouebec

GLENFORD, Quebec.

OHIO, —Strongsville, O., Feb. 18.—Eiitor Forest and Stream: Our partridges have wintered well so far, and they are more plentiful now than I have ever known them at this season of the year. I know of twelve or iffteen birds within a radius of one mile of my house. Our shooting is mostly over the hills and gullies of the Rocky, River, with considerable underbrush. I have been remarkably lucky with what little shooting I have done this season. Rabbits were not very plenty this fall; they were hunted too much with ferrets last winter. We have a fair supply of quail left. So far we have a fair show for good shooting next fall. Foxes are quite plenty and afford us fine sport on the light snows. Five have been killed. Pigeons have commenced flying in quite large flocks, but few have been shot as yet. Snipe have not put in an appearance yet. They don't often come until the last of March. Have seen some large flocks of ducks going north. One of your correspondents, a few weeks ago, writing of squirrels laying up their store, says: "Who ever saw a squirrel with a nut in his mouth but that he stopped and ate it at the first convenient place?" If he has not, I have frequently cut trees in which I have found upwards of half a bushel of good hickory nuts. On Feb. 19 I found four more partridges that I had not known of before. They were on my farm. My neighbor says they hatched there.—W. S. A.

there.—W. S. A.

Chicago, Feb, 23, 1882.—We had some very good duck-shooting here until the cold wave struck us last Monday and froze the marshes up and drove the ducks south. Geese have been very plenty this year, but they are in a wretched condition and not fit to cat. Mallards are selling at \$1.20 per dozen on South Wall street. The Riverdale and the Blue Island Clubs had a shoot at Blue Island yesterday (Washington's Birthday); the Riverdale Club won. The Lake George Sportsman's Association, of this city, will be obliged to vacate their shooting grounds at Lake George, Indiana, as the land their club and boat houses stand on has been bought by the "East Chicago Company" and the Chicago Belt Railway Company, these companies having bought ten thousand acres of marsh land—which includes Lake George and Wolf Lake—and will erect immense iron works, factories, etc., as soon as spring sets in. The surveyors have already commenced their work, and in a few months one of the best ducking grounds in the western country will be destroyed, and the "outlet," Blue Bill Point and Rice Island, will be things of the past.—Tex-Bore.

Foxes on Ice.—Baltimore, Feb. 20.—In your issue of Feb. 2 "Sancho Panza" says that a friend of his asserted that a fox left no scent on crystal ice. You, also, corroborate his assertion. I know very little about fox hunting, but I witnessed a sight last winter that certainly does not verify this assertion. Three of us were engaged in breaking the ice in front of our blind on the Dunder river, which is a branch of the Gunpowder, so as to get a hole large enough to put in our decoys. The ice was about an inch or an inch and a half thick, and as clear and smooth as glass. We heard the music of the hounds across the river in the woods, and presently saw Reynard come out on the shore, and, after looking at us for a moment, he took to the ice and made a bec line for a point about half a mile off. He got across and out of sight before the hounds came out of the woods; but as soon as they did they struck the trail and went across the ice in full cry, making a beautiful sight. The morning was quite cold, and the ice did not thaw any until several hours later. The fox was run into his den and dug out by those chasing him.—E. A. R.

Connecticut.—South Norwalk, Conn., Feb. 10.—Mr. Gillespie, of Stamford, has a bill before the Legislature to prohibit the shooting of quail, partridge and woodcock in the county of Fairfield for three years. As woodcock are migratory and don't remain in this county after the 15th of November, to protect them longer than the law does now would seem absurd to say the least, as they would be shot as soon as they migrate in the fall by sportsmen of other counties and States. In view of the scarcity of quail and partridge it would be a good idea to protect them for one year, and I think every one would stand by such a law, but to do any good it should cover the State, not one small county. There are too many complications in our game laws now without adding such a one as Mr. Gillespie proposes.—Oald Honker,

Omo.—Harmar, O, Feb. 18, 1882.—We have just organized a sportsman's club composed of the best sportsmen of our town, and have for our object the protection of game by law. We will this week publish a warning in our local papers that after this date we will prosecute all persons violating any of the game laws, also all grocerymen for selling game killed out of season. We mean business, as there are a class of pothunters here who kill all kinds of game in almost all times of the year, and if they still persist in so doing it will be dear game for them. Quait are very scarce here and must be protected. Grouse are very plentiful, but so shy that it is almost impossible to get a shot at one. These with a few squirrels and rabbits is about all our game. Our club numbers twelve members, all of whom have breech-loaders. We occasionally indulge in an afternoon at glass ball shooting, making very good scores, as twenty-eight out of thirty is not an uncommon occurrence. We have sent for some clay pigeons and a trap, and will try our skill at pigeon shooting this week.—H. S. Omo.-Harmar, O. Feb. 18, 1882,-We have just organ-

DIDN'T-KNOW-IT-WAS-LOADED.—Editor Forest and Stream: I thank you for the scoring you are giving the fools that for amusement point firearms at their friends. If there is any act that would justify "shooting on the spot" this is one of them. How many innocent victims have gone down to the grave, leaving scores of bleeding hearts to mourn all through life, the results of this worse than insane folly. I am confident that every person familiar with the use of firearms, and the dangers attending such use, even in the hands of the most cautions, will thank you for the position you have taken. An insane asylum is the only safe place for those that can find no other amusement. Keep it before the people.—D. T. C.

Hornelsville Association.—Hornelsville, Feb. 23.—The Hornelsville Fish and Game Protective Association has just been organized. Articles have been drawn up and filed with the Secretary of State so the Association will be in a position to enforce the laws. Our river and streams have been stocked with bass and trout; the supervisors have stopped all fishing for three years. We propose to see the laws en forced, and give the fish and game a chance. The following officers were elected—J. W. Robinson, Pres.; H. Leach, Vice-Pres.; G. W. Griswold, Sec.; L. T. Charles, Cor. Sec.; T. FitzGibbons, Game Warden.—J. Otis Fellows.

West Boylston, Mass., Feb. 24.—A strange animal has been seen by a number of people in the easterly part of the town. Attempts have been made to capture it, but without success. It is somewhat larger than a cat, with long hair standing outward from its body. Mr. Albert B. Pierce has a record of seven foxes which he has bagged this winter, besides a large amount of other game. He has made the best record, although others have killed several. Last week Mr. Pierce started up two, but they reached a burrow which he could not dig out. he could not dig out.

Bangor, Me., Feb. 24.—At the annual meeting of the Noromlega Sportsman's Club for the Protection of Fish and Game, held Feb. 22, the following officers were elected for the ensuing year, viz: Chas. York, President; H. N. Fairbanks, Vice-President; Fred. T. Hall, Secretary and Treasurer; John P. Tucker, H. W. Durgin and Thos. F. Allen, Executive Committee. The club is in a prosperous condition, and great interest is manifested in seeing that the laws are strictly obeyed.—No-Ram.

CAPT BOGARDUS writes from Elkhorn, Ill., that there are CAPT, ISOGARDUS writes from EIKHOPP, III., that there are more ducks there now than at any other time within ten years. The Captain and his sons, Eugene and Henry, have joined Cole's Circus for the season. Now the country fences will be placarded with twenty million dollar challenges to all other biggest shows on earth to produce an equal family of fine shots. of fine shots

Shinnecock Bay. -Good Ground, Long Island, Feb. 20. During the last warm weather redheads and broadbills came into the bay by thousands, and as there is plenty of spring feed, the chance for sport looks better here than for years, especially for redheads. No geese yet.—William N. Lane.

The Evansyille, Ind., Argus reports: "The blue bird has The Evansville, Ind., Argus reports: "The blue bird has been here. He only stayed one day, however, and then had his valise checked back to New Orleans, where the wind didn't blow the feathers of his tail over his right eye twenty-three hours out of the twenty-four."

A double-tailed goat is one of the products of Walton County, Ga. The other goats regard him as a kind of oleomargarine butter.—Commercial Advertiser.

SENSIBLE DOG LAW.—A bill has been introduced into the Maryland Legislature which has some novel features. provides for an inventory of all the dogs in the State before the 12th of May, each year. The county commissioners before the 12th of April are to divide each election district into as many divisions as there are constables in the district, who are to perform the work of their part under penalty of \$500 for failure so to do. Upon the return of the lists the county commissioners will assess each dog at \$25; the owner of said dog can place a higher value on him and pay the same as on other property. The owner can recover damages if any one injures his dog, unless the dog was engaged in the destruction of stock or poultry or was killed or injured by some one in his own defence. The bill further provides that owners of dogs are liable for damages done by them to property or

Gamblers in Convention .- A great concourse of gamblers is now in convention in this city. The occasion is a six-days' pedestrian match. The walking is only a wheel in the gamblers' machinery to wheedle money into their purses. The style of betting now carried on at the walk is clearly against the law, but by some hocus-pocus or other an injunction has been obtained, restraining the police from interfering with the unlawful proceedings of these blacklegs, and the injunction is to be argued March 6th, the Monday after the finish of the walk! The whole affair is a disgrace to the community. Pool-room, horse-race and walking-match sharpers have manipulated the law and the police too long.

Sea and River Hishing.

In he used to gang, out, out, out, and ever sae far out, free the point In he used to gang, out, out, out, and ever sae far out, frae the point o'n promontory, sinkin aye further and further doon, first to the waistband o' his breeks, then up to the middle button o' his waistcoat, then to the verra breist, then to the exters, then to the vera chin o' him, sae that you wunnered how he could fling the flee, till the last o' a' he would plump richt doon oot o' sight, till the Highlander on Ben Crunchan thocht him droomed. No he, in deed: sae he takes to the sooming, and strikes awa wi' ae arm: for the tither had hand o' the rod; and could ye believe't, though it's as true as scripture, fishing a' the time, that no a moment o' the cloudy day micht be lost; ettles at an island a quarter o' a mile off, wi' trees, and an auld ruin o' a religious house, wherein beads used to be counted, and wafers eaten, and mass muttered hundreds o' years ago; and cetand wafers eaten, and mass muttered hundreds o' years ago; and get ting footing on the yallow sand or the green sward, he but gies him-self a shake, and ere the sun looks out o' the cloud, has hyucket a four-pounder, whom in four minutes (for it is a multiplying pirn the creter uses) he lands, gasping through the giant gills, and glittering wi' a thousand spots, streaks, and stars, on the shore.—The Shepherd in an account of the angling of Kit North, in "Noctes Ambrosiana."

WITH THE GRAYLING.

A BOVE the hills the dawn of morning breaks, And sheds its flood of radiance o'er the lea; The clear-voiced brook makes laughing minstrelsy; Deep in the bosky woods the pheasant wakes.

O'er moss and fell the frosty glory lies.

The birch receives it on its silvern bark;
The moorhen's eyes grow brighter still; and hark! The heron's scream, as homeward now he flies

To me the morn yet holds a greater charm A pleasaunce sweeter, deeper, more serene Than e'en the jewelled glories of the seene; A soul-slave rare as Gilead's gracious balm.

I "go a-fishing" for the Umber shy Whose fridescent sides shame Orient pearls; See with what gentle, oily, dimpling swirls The soft stream curls as Umber takes the fly:

Oh! panacea for all sub-lunar woes The nerve-delighting fight a grayling makes!

Be gentle and be calm, his lip oft breaks—
Good fisher, not so rough, or off he goes!

Triumphing do I stand, with gladsome brow A quivering bar of silver gracefulness Upon the mossy bank, in death's distress. As fragrant as the wild thyme, see him now.

Thence homeward through the brake, or o'er the lawn. With spirit cheered to greet the toil of day,
And heart as buoyant as the waving spray
That all be-gemmed, sways in the breeze of morn.
Creon. in London Fishing Gazette.

CAMP FLOTSAM.

II. CONCERNING "SIGNS,"-CONCLUDED.

THERE are certain "signs in the moon" which, from time immemorial, have been regarded by anglers as influencing, in no small degree, their success. We must confess at the outset a very limited knowledge of these and leave them to be more fully enumerated by the brethren of the angle who

the outset a very limited knowledge of these and leave them to be more fully enumerated by the brethren of the angle who may "jine in experience."

"It is a "sign," which, we believe, the Indian left behind him, that when the new moon lies on its back, that is, with the concave upward, it is a "dry moon" or a sign of dry, pleasant weather. The logic of it is, that "the water can't run out." There is, however, an interpretation of this "sign" which makes it a "wet moon" for the reason that "it is full of water." Likewise, we have the signs that when the horn of the moon is turned downward it is a "dry moon" because "the water has run out," also a "wet moon" because "the water can run out." The authorities upon each side are so numerous and respectable that we are unable to come to a conclusion without hearing argument.

There is quite a prevalent belief, among a class of anglers, that fish do not "bite" in the full of the moon; the reason given is, that they feed nights. While the fact, given as a reason, is undoubtedly true, the deduction therefrom, that fish "won't bite" during days when the moon is in the full, is certainly false. The opponents of that theory instance the fact that catfish and cels "bite" on dark rainy nights, and argue therefrom that fish feed when in the mood, whether it be in darkness or in light.

fact that cattish and cels "bite" on dark rainy nights, and argue therefrom that fish feed when in the mood, whether it be in darkness or in light.

It seems to us that these have the better of the argument, for we have certainly had as good success on days when the moon was in the full as at any other time, and this, as a rule. At such times we have seen and heard the fish—black bass—leaping in every direction upon the surface through moonlight nights, which proves nothing more than that the fish were moving about, for certainly, there was not sufficient food or insects floating on the water to account for the number of fish which were leaping, for, be it remembered, this was upon a lake some two and a half miles long and half a mile wide. Our own theory is, that on moonlight nights when there is a gentle ripple on the water, the fish are attracted to the surface, and that their leaping is mainly in sport. The time when we have observed this has always been mid-summer, and, on these nights have known the fish to persistently refuse the fly, in fact we have never known one to be so taken at night at this lake. In accepting the full moon to be so taken at night at this lake. In accepting the full moon to an indica, are we not compelled to assume that fish prefer to feed at night and that they won't feed by day when the moon is full, and from this are we not eld directly to the position that fish can find their food more readily by "the uncertain light of the moon" than in the light of day, a position, we venture to say, difficult to maintain. The advocates of the former theory seem inclined to invest the fish with an absurd habit, in causing him to feed at night, whether in the mood to not, or, in supposing that if the desire for food seizes him in the night he at once seeks to satisfy himself, while, if such desire comes over him by day, he postpones its gratification until

night he at once seeks to satisfy himself, while, if such desire comes over him by day, he postpones its gratification until night—if the moon be full, and—it might be added with equal sense, after first examining the "weather probabilities" to assure himself that he will be in no danger of losing his meal by the intervention of a cloudy night.

We have often heard it asserted that black bass will not bite after sundown. We have caught them after that hour, and until dark, in considerable numbers, while still fishing with black crickets, and on several occasions we have taken them with the same bait as late as ten o'clock at night, not, however, in large numbers, for we only tried it at that

nour as an experiment, for a short time on each occasion. Another "sign" with some anglers is that black bass won't bite after the first leaves fall upon the water in the fall of the year. As we have been informed by reliable anglers of large catches made by them much after this, and inasmuch as FONEST AND STREAM announces as in season for December Micropterus salmoides, we are fain to believe "there is nothing in it."

Who where here are the short time of the salm is the salm in the salm is the salm in the salm is the salm in the salm in the salm is the salm is the salm in the salm is t

when a boy, failed to learn that ancient "sign" that "after 'peepers' have been stopped three times, suckers will run!" and did not feel himself "stirred as with the sound of a trumpet" by the musical swells breaking along the meadow or the woodland marsh—the precursor of summer and of angling? The connection between the two, so far as the "sign" goes, is like the warning set down in the old almanaes for January, "look—for—snow—about—this—time." The same may be said of the sign, "when dogwood blossoms pickerel bite," or of the similar one of corn being in silk.

Closely allied to anglers' "signs" is another class of "signs" born among and held by anglers of the past, along the sandy beaches and coves of Long Island and the bolder shores of the lower Hudson. These relate not to fish, but to "buried

beaches and coves of Long Island and the bolder shores of the lower Hudson. These relate not to fish, but to "buried money," for it would seem as if these contemplative men, dreaming in bays and inlets and creeks, with minds stored with "sign" and liquid, sometimes wandered to another land fairer than the lost Atlantis or the Utopia, which has never been found, and brought from thence strange wild stories of richly-freighted galleons, sunk upon the main; of strange men in stranger costumes, who concealed, with "sign" and spell and incantation, in lonely spots, chests iron-bound, filled with jewels and gold—the fruitless attempts to recover which have haunted the shores of our bay and river with the best poetry of the New World. Verily, the angler of the olden time had food for contemplation, when, drifting idly through long summer days, he waited patiently for the luck

older time had food for contemplation, when, drifting idly through long summer days, he waited patiently for the luck which came not.

Angling successfully, like learning, has no royal road. Angling successfully, like learning, has no royal road. Signs, no more insure fish than a schoolmaster can capacity. Hence our two classes of anglers—the lucky and the unlucky—seem each born to it; the one to return at nightfall with a well-filled creel, dry and satisfied as to the inner man; the other with the proverbial "fisherman's luck." Indeed, we have often been told by those of whom we expected better things, that though they were fond of angling, they "don't go any more, for they never have any luck." Shades of Walton! We beg everybody's pardon, but must remark that he who measures the result of his day out by the scales or the number which night finds in his creel, is just the man

ter things, that though they were fond of angling, they "don't go any more, for they never have any luck." Shades of Walton! We beg everybody's pardon, but must remark that he who measures the result of his day out by the scales or the number which night finds in his creel, is just the man who will sit down and reckon the per pound which his fish have cost him, charging up a day of lost time in the calculation. From all such, good Lord deliver us.

After all, there is no accounting for this sort of luck at times. It almost seems as if some anglers were destined to take every fish within cast of the boat, while their equally expert, patient brother in the same boat with the same bait never gets a strike or a nibble. We have often thought that fish could tell which bait was cast by one of gentle disposition, and which by one of violent nature or of sullen, angry moods, and that they gave that of the latter a wide berth.

If anglers are not born, but made, we must insist upon a belief in innate taste. We have seen a sturdy youth content to stand and dangle a cord with naked hook—by the hour—along a brooklet in which there had never been a fish—at least within the memory of man. Who has not seen the boy content in fishing in a pail of water, or in a pool formed by a summer's shower? Did the resemblance never strike you, my angling friend, between these early manifestations on the part of the boy, and those of his sister with/her doll? Whence come they? The stick and strings are point in the boy's hands and he is told to fish, you say, and the doll is placed in the child's arms with some like saying. Very good! Are they not apt? But sticks and strings are common playthings with the boy and can be put to hundreds of uses in his games. Yet, he chooses this particular way, and that, too, in a manner not the easiest or most natural to his tender years. Is it not born in his bone, sinew and spirit? Comes it not down through a line of generations from the days when, as Juvenal has it, "A chill cavera from the forces in hi

awakens.

Let those who will, "scout" the anglers' "signs.

not of them. They came with our boyhood, drop Let those who will, "scout" the anglers' "signs." We are not of them. They came with our boyhood, dropped from loved lips which are silent and can utter no word in their defence; they are a part of our day out with our rods, and let us believe that our manhood is none the less multy and strong if, on these days the involuntary query comes upon us —as it does come and will come, in spite of our philosophy—"is the 'sign' right?" WAWAYANDA.

A Handsome Present.—We were shown by Messrs. Conroy & Bissett, last week, the following handsome angler's outfit: One split-bamboo salmon fly rod with gaff, mised pillar reel, Holberton fly book, flies, etc., in fact everything complete and ready for use, all heavily gold plated, in magnificent velvet-lined sole leather case, with silver name-plate and corners. Also, one each black bass and trout fly rod, split bamboo, with reels, landing net, fly books, etc., etc. complete—gold plated and in same style of case—making a most complete and elegant outfit. In addition, there was a trolling box containing everything in the shape of lines, minows, spoons, etc. This outfit is for a present to a prominent New Yorker, ordered of Messrs. Conroy & Bissett, and details left to Mr. W. Holberton.

THE VALUE OF ANGLING.

IN a recent address before the Farmers' Institute of Iowa, Mr. B. F. Shaw, the able Fish Commissioner of that State, made an address upon Fish, Fishing and Fishculture, from which we extract the following:

From the cradle to the grave we hear more or less of these subjects. The babe sitting on its mother's knee hears her simple ditty:

ple ditty:

" Many fishes in the brook. Papa catch them with a hook Baby eat them if he can.

Baby eat them if he can."

And he will be quite likely to remember his first attempt at eating them. The tempting but deceptive monthful of sucker to be swallowed by the youngster who is scarcely more than one himself, the disposition to swallow too much and in too much of a hurry, the cruel, sharp-pointed bone that pierced his throat, getting more firmly fixed with every effort made to disgorge it, the frantic mother kindly beating his back in the hope that the concussion may serve to dislodge it, until his back is black and blue for many days after. The dry crust of bread with sharp-pointed corners that was thrust down his throat, cutting furrows that for days after felt like the ragged edge of every unpleasant thing; the final desperate effort of the mother with one of her longest fingers down his throat, seeming to him to be feeling for the 'soles of his feet; the tipping over of his stomach and final dislodgment of the bone in some mysterious manner, are memories that will go with him through the lift's journey.

stomach and final dislodgment of the bone in some mysterious manner, are memories that will go with him through life's journey.

Do you remember the little creek that used to cross the road or meander through the pasture and meadow, and how as a seven-year-old man you one day, in looking into its conomous pools—fifteen inches deep and full two feet across—saw the monstrous finny leviathans; how you determined to capture some of them; how you went to your mother's spool of cotton thread and took a piece four foot long, and from the pin-cushion a pin, and how, with a bent pin for a look, the thread for a line, a twig for a pole and a worm for bait, you sallied forth to do or die; how you trembled for fear that you should miss him as you approached the scene of action; the throwing in of the bait, the glorious nibbles, the final good, solid bite, and the throwing clear over your head of an immense shiner, fully two inches long; the repetition of the same until you had a full dozen—enough, in your imagination, to make a square meal for all your family; and how mother, to please the vanity of her pet, had them cleaned and cooked to a crisp, and the deliciousness of this meal of the first and finest fish you ever caught? If you do not remember these things, then you have missed one of the sweetest memories of life.

You see the boy of twelve to sixteen years in his rugged mountain home, where all have to labor manfully for a bare subsistence. He does his full share of the hard work with a

You see the boy or twelve to sixteen years in his ringged mountain home, where all have to labor manfully for a bare subsistence. He does his full share of the hard work with a cheerfulness that shows the stuff he is made of, but he has been for the past month silently but fervently praying for a rainy day. He has an abundance of work for every pleasant one, and he knows that the trout bite best when it rains. It comes, and the more dismal and dreary the day the more the sunshine of the boy's buoyant spirits is shown in his face.

cheerfulness that shows the stuft he is made or, our ne mas been for the past month silently but fervently praying for a rainy day. He has an abundance of work for every pleasant one, and he knows that the trout bite best when it rains. It comes, and the more dismal and dreary the day the more the sunshine of the boy's buoyant spirits is shown in his face. His enthusiasm is an inspiration that brings a sympathetic joy to all his family, old and young alike. His chores early done, he, with doughnuts in one pocket and his thin box of worms in the other, is off for the brook. Though barefooted, he has no time to take around the road; but, through briar patches, windfall, thorn brakes and other obstacles, he takes a straight shoot for the best hole in the brook, or to the big spring with an intent to fish the whole length of the stream.

When once there he puts his horse-hair line—the result of much study and labor of his own—upon the slender willow pole that he cut last year and has carefully seasoned in the shade until it is as light and springy as wood can be made. With his sprout hook and light sinker he is ready for business. If you have fished for trout, you know what it is, if not, it would be hard for any one, however gifted, to give you a fair idea of its pleasures and perplexities. That boy has been there so often that he knows just how and what to do. He glides behind a stump and, with the cauliousness of a cat, creeps to the edge of the stream. Carefully he takes the bearing of the water as it swirls under the bank, and with a skill that only comes with experience he drops his angle so softly that scarcely a sound or ripple comes upon the water. It is carried down by the current. A moment's suspense, a rush, a swirl in the water, at tightening of the line, a twist of the wrist upon the pole that is known as "the strike"—which fasten the hook in the fish's mouth, the runkes of the fish to and fro and his wonderful leaps into the air as he gallantly struggles to free himself, the coolness of the boy as he

and he goes home with a light heart and a firm step to show his mother how successful he has been. Her evident grati and he goes nome with a light heart and a firm step to show his mother how successful he has been. Her evident gratification at his success, her pride in his growing manhood and her praises of his skill and prowess fill his heart once more with filtal love and determination to be and do something every day that shall be worthy the praise of so good a mother.

mother.

Seventy years or more later, you see him an aged patriarch, after having fought life's battles manfully, with his rod and line, following the same meandering brook with his heat still full of hope and expectation that each new cast will bring him some new conquest, and still dreaming that "the superb sport of to-day will be excelled by the grander sport of to-morrow." And now he sings one of his favorite songs:

"It'e angled in many waters
On many a summer's day.
In many a murmuring river, By many a tangled way;
But the voice of that brook has never
Lost its pathos and charm for me,
As it ripples and runs forever To its grave in the mighty sea."

Should you see and hear him while his silvered hair wa overed from sight, you would ask, "What boy is that?" and Should you see and hear him while his silvered heir was covered from sight, you would ask, "What boy is that?" and when told that it was the same boy who, seventy years before, swallowed the sucker bone, you might at once compare him with old Mr. Skinflint and Hon. Moneybags, and well wonder how it could be. Look deep down into his innermost heart and see the golden memories of a life well spent in communication with nature and thus with nature's God. His life has been one long fishing trin after knowledge—for in communication with nature and thus with nature's God. His life has been one long fishing trip after knowledge—for the hidden secrets of nature, for happiness for himself, his loved ones, his friends, and for bumanity, and not for power or gold. His stalwart form, his pure heart, and his still brilliant mind are his best possessions. Would you have him barter them for the gold he might have made without earning from those who have earned, without getting it, the shrunken and shriveled body, the dwarfed mind, the impure heart and stricken or hardened conscience of the money-getter? No. You may value the gold, perhaps, for more than its worth, but you would never take it at such a cost.

FISHING AT HORTON'S POINT.

FISHING AT HORTON'S POINT.

I USED to go down to the east end of Long Island (or rather, what would be the east end if a good piece were cut off), and when it was possible to get out on the Sound at Horton's Point, you might count on finding subscriber out among the fishermen. Sometimes on a very pleasant, calm day the change of tide would bring with it a heavy swell and an off shore wind; then you might count on getting all the work you wanted in rowing ashore, and often a spill in the surf as you made a landing.

One day Fred. R— and I were out in a miserable flat-bottomed scow that would go only one, way at a time, and that always the wrong way. We fished close in shore and got a few sea bass, but found that by getting further out we could do better, so we kept gradually working further off shore until it got pretty well on in the afternoon. The breeze was freshening and the water rising, but the fish were doing their pretitest, and we did hate awfully to quit. Finally I said, when I got niy next fish we would give-up. That time was not long in coming, for I soon got the twitch that sounds "to action," and on hauling up found I had on a skate about twenty inches long and a dogfish nearly three feet long. Well, there was a little fun about that time. I was too old a fisherman to think of losing either fish, though one of them was good for nothing, but it required all my strength and skill to save both. My plan was soon laid, and I hauled in the dogfish, got him by the tail, took out the hook, then let the skate play on a taut line while I killed the dogfish—no easy thing to do, by the way—then the skate was pulled aboard and added to our mess.

We were only about a mile from shore, but that mile was the longest I ever traveled on water. The boat bounced around and turned wrong end foremost; got sideways and tried hard to get on top of us; in fact, we did begin to think she could sail better that way, but how to get her turned over, and we on top, was the difficult problem, and it was decided that, as we came

Angling and Politics.—It is well known that President Arthur is an enthusiastic and skillful angler. Mr. George Dawson, of the Albany Ecening Journal, author of "The Pleasures of Angling," and one of the veterans of the craft, is an intimate friend of President Arthur. Some years ago, when the latter caught the fifty-pound salmon, which will always make his name famous on the piscatorial roll of fame, Mr. Dawson wrote to us of the great pleasure it would have given him, had he himself brought the big fish to gaff, but adding that as the gratification had been denied him, there was no other man in the world whom he would rather have catch the fish than his friend and fellow angler, Chester A. Arthur. We were reminded of this letter by seeing in the was no other man in the world whom he would rather have catch the fish than his friend and fellow angler, Chester A. Arthur. We were reminded of this letter by seeing in the Albany Journal, the other day, some comments by Mr. Dawson on President Arthur's recent appointment of General D. B. Warner, of Ohio, to the office of Consul at St. John, New Brunswick, a position which he formerly held. "Although blessed with but one arm," says Mr. Dawson, "General Warner can cast a fly and kill a salmon as defitly as any fully equipped angler we ever met with, and it was as an angler and not as a Government official that General Arthur first formed his acquaintance. He was the lessee of the river from which the President has taken many a score of the king fish of all waters, and, having enjoyed this unpurchasable luxury through the courtesy of General Warner, it must have afforded him extreme pleasure to reciprocate his courtesy. Having shared in General Warner's courtesy upon more than one occusion, and thereby reached the summit of an angler's ambition, we desire to congratulate him upon the fact that the bread he cast upon salmon waters years ago has returned to him after many days. It was while enjoying the kingly sport made possible by General Warner's kindness that the President met the scholarly and accomplished Judge Gray, of Massachusetts, whose appointment to the Bench of the Supreme Court has given such universal satisfaction. From these simple incidents it can be seen that it sometimes pays to be courteous and that it is not always time wasted to 'go affishing.'

MICHIGAN FISHING.—The Elk Rapids, Mich., Progress reports that the aggregate catch of black bass by local anglers from May 27 to September 2, 1881, was 4,200; of trout, 3,310.

THE TEN-POUNDER.

THE TEN-POUNDER.

REGARDING the fish called by Capt. Dampier a "tenpounder" in his notice of Southern fishes, published in Forest and Streean a few weeks ago, and about the identity of which our correspondent "S. G. C." raised the question, we may be able to throw a little more light. By favor of Mr. Frank Endicott, who kindly gave us the first extract from the book of the doughty captain, who sailed in search of plunder, fame, knowledge and fish, we have another extract from Dampier's description of the "ten-pounder" which may lead to its identification.

"Ten-pounders," writes Capt. Dampier, "are shaped like mullets, but are so full of very small stiff bones intermixt with the flesh that you can hardly eat them." Mr. Endicott writes: My own impression is that it is a fish known locally on the Homosassa River as the "skipjack," a long, slender, pickerel-like body with a powerful tail, small head and large eye, dorsal fin setting down into a filmy case as to be out of the way in its lightning-like movements through the water.

This fish took the fly very readily and almost literally, for

the way in its lighthing-like movements through the water. This fish took the fly very readily and almost literally, for after a desperate struggle, in which it would frequently get loose owing to the tenderness of its mouth, it would leave the fly all ragged and useless, in fact, almost reduced to its original elements of simple hook and gut.

Dr. Ferber and I had some of them cooked as an experiment, and found them very bony, but of a very delicate flavor, somewhat resembling a shad.

F. Endicott.

Pensacola, Fla., Feb. 23, 1882.

PENSACOLA, Fla., Feb. 23, 1882.

In your issue of Feb. 16, you ask what is a "ten-pounder," etc., etc., and I write to say that I have heard the Elops saurus (Linn.) of the Gulf Coast called by that name. I do not understand how the name could be reasonably applied to this fish, as it is usually of much less weight than ten pounds, and am inclined to think the name was originally given to some other fish which, perhaps, the E. saurus resembles. Elops saurus is of the same family as the tarpum, and their general habits seem to be very similar. In this section it is commonly called "lady-fish" and "skipjack," and is exceedingly abundant during the greater part of the year. It arrives on the coast in early spring in immense schools, which remain several weeks about the inlets and sea-beaches, before entering the bays and lagoons. At this season it swims near the surface preying upon the schools of small fishes that are also coming inshore, making a great commotion all the while the surface preying upon the schools of small fishes that are also coming inshore, making a great commotion all the while and attracting large numbers of sea birds. By the middle of summer the schools are broken up and the individuals are scattered all through the bays, lagoons and bayous, where they feed in shoal water on grassy bottoms, upon such small fishes and crustaceans as may be found there. In the fall they again form schools and gradually leave the bays altogether. The spawning season is in September and October, as determined by the ripe ovaries taken from them during these months.

as determined by the ripe ovaries taken from them during those months.

I have never had an opportunity to follow their movements closely at this period, so cannot say how or where they spawn. It is probable, though, that the spawning grounds are in the bays, for in the early spring I have caught very small specimens there, which must have been hatched near to where they were exight.

small specimens there, which must have been hatched near to where they were caught.

During the summer specimens are occasionally taken by hook and line, and they afford considerable sport, as they are very gamey. Their fiesh is soft and tasteless and quickly spoils, besides the quantity of fine bones it contains makes it undesirable for food. The average size of this fish is about twenty inches long and about three pounds weight, but specimens are taken of twice those sizes. The "lady-fish" is quite valuable in West Florida. for it makes the best bait that has been yet found for red-snappers. It is used both fresh and salted, and quite a large quantity is preserved by the fishermen each year.

salted, and quite a large quantry is protected by men each year.

Elacete canadus has besides the names "cobio," "sergeant." "crab-enter" and "snooks," the name of "ling" among the fishermen of this section. Here it is found only in the deep water at sea, and usually on the red-snapper grounds.

The tarpon is usually called "silver fish" here, or else "tarpon" instead of "tarpum," as in other parts of Florida.

SLLAS STEARNS.

SILAS STEARNS,

MORE ABOUT CHUB.

IT was my good fortune to live about six years in the smart little village of High Falls, Ulster Co., N. Y., situated on the Rondout Creek, twelve miles from where it empties

on the Rondout Creek, tweive miles from where it empires into the Hudson.

The village takes its name from a waterfall at that point of about forty feet, furnishing a splendid water-power, which is chiefly utilized by three large cement mills—Norton's, Dela-field's and Van Dennark's. The rugged country thereabouts abounds with cement rock, and the market is largely supplied from that region and the adjoining town of Rosendale. Midfrom that region and the adjoining town of Rosendale. Mid-way between High Falls and the Hudson River, the Wallkill

from that region and the adjoining town of Rosendale. Midmay between High Falls and the Iludson River, the Wallkill
empties into the Rondout, about doubling its volume of water
from that point. The Wallkill is well stocked with black
bass, and affords fine fishing. Bass are also taken in the
Rondout at and below the mouth of the Wallkill. Few are
eaught above; not any as far up us High Falls. Some seasons, however, chub are quite abundant. They are a pretty
fish, almost as gamey sometimes as a bass, and the meat is
white, solid, of fine fibre, and delicious.

In shape they correspond with the wood-cut given in
"Chambers' Encyclopedia," where they are said to be of the
Leuciscus genus, and of the family Cyprinide. In color they
also agree with the description there given—"buils black on
the upper parts, passing into silvery white on the belly."
They are found in the warm months in the rifts and strong
currents. We used for bait either grasshoppers or grub. Our
mode of fishing for them was with a long bamboo, with a
line of the same length, and a simple hook of medium size.
We would wade into the rifts, and cast into the deeper channels. It was common for them to rise and take the bait the
moment it struck the water, and make off with it up stream.
Giving them ample time, you were almost always sure of
your fish.

I teeall two gathers peculiar incidents in chub-fishing. In Giving the

your fish.

I recall two rather peculiar incidents in chub-fishing. In the summer of "71 I was expecting a friend, who is fond of fishing, from New York, to spend a few days with me. I went, out in the afternoon, as he arrived in the evening, to see went out in the afternoon, as he arrived in the evening, to see whether the chub would bite, I went up the creek, to what is there known as "The Rocks," baited with a grasshopper, and standing back the length of my rod from the shore, I dropped the grasshopper upon the surface of the water alongside of a large rock, gently washed by the current, where the depth was about four feet. The moment the balt struck the water I saw a sunfish snatch it and dive down. I gave him a slack line, and presently the slack began to be slowly taken

I pulled, and to my amazement landed a plump twoup. I pulled, and to my amazement landed a plump two pound club. He must have begrudged the sunfish his frugal meal, and appropriated himself the morsel, paying his life for his greediness. Soon adding three more fine fellows to him, I returned home to report to my friend on his arrival that the fishing was good, as we also found it the next day at "The Rocks."

On another occasion I went club-fishing, and it was in my way to call on a side older who had been suffering from a

On another occasion I went chub-issing, and it was in my way to call on a sick elder, who had been suffering from a long run of fever. His fever was slowly subsiding, and he was well nigh in the early stages of convaisseence. The elder was something of a fisherman. His house stood upon the banks of the river, and many a nice haul had he made from was something of a fisherman. His house stood upon the banks of the river, and many a nice haul had he made from the rifts near by. Asking me to stay on my return to report luck, which I promised to do (though it would have been a hard promise to keep if I had not taken a scale). I took my leave of him and proceeded a few rods up the stream. I stopped on a bank at least twelve feet above the surface of the creek, where there was a short, sharp curve, the water eddying in the curve, and quite darkened by the low overhanging boughs of two large white oaks that rooted themselves in the margin. It looked very fishy down there; but, then, how was I to make a cast with my rod among all those limbs? I hit upon this plan: Placing my rod upon the ground, with the tip just at the edge of the bank, and making sure that my line was free, I took the looked grasshopper in my hand and cast it down upon the surface. The instant it struck it was seized by a pound and a half chub, and the way that water boiled, and that line surged, and that tip danced up and down, and my nerves quivered, is beyond the power of description. I could only hold on and left him play till he exhausted himself, and then haul him up hand over hand, which I did successfully. A little further up, on a clean, unobstructed shore, I had the good fortune to land several more that afternoon. On my way back I reported myself to the sick elder, and as his languid eyes surveyed my string of chub his wan face brightened up wonderfully, and he has assured me, a score of times since, that in all his sickness nothing did him so much good as the sight and smell of those chub.

Spearing Fish Through the Ice.—Following is an extract from a letter dated at Alexandria, Jefferson county, N. Y., Feb. 12, 1882: "This cold weather has given us some magnificent skating and ice-hoating. The river is frozen to the depth of six inches, with good clear ice, the entire distance from here to Ogdensburg, and below. I had one novel experience, i.e., that of skating down fish, and spearing them. It was done in this way. We went over on the flats, and the clearness of the ice gave us a good opportunity to see the fish lying on the bottom. Then we chased them until they became there remain until we cut a hole in the ice and speared them. Three of us speared seventeen fish in this way in less than three hours, all pickerel and muskelonge."

THE EEL QUESTION.

A paper read before the American Fishcultural Association by Prof. G. Brown Goode.

A paper read before the American Fishcultural Association by Prof. G. Brown Goode.

It is the disposition of American ichthyologists to accept, for the present, the views of Dareste, and to consider all the cels of the northern hemisphere as members of one polemorphic species. Gunther is inclined to recognize three species in North America—one the common cel of Europe, Arguilla vulgaris; one the common American cel, Anguilla bootoniensis, which he finds also in Japan and China; and the third, Anguilla terana, described and illustrated by Girard, in the Report of the United States and Mexican Boundary Survey, under the name of A. texana, which, he remarks, is scarcely specifically distinct from A. bostoniensis, from which it differs only in the greater development of the lips. The distinction between A. bostoniensis and A. vulgaris, as stated by him, consists chiefly in the fact that the dorsal fin is situed a little further back upon the body, so that in the former the distance between the commencement of the dorsal and anal fin is shorter than the head, while in the latter it is equal to or somewhat longer than it. This character does not appear to be at all constant.

GEOGRAPHICAL DISTRIBUTION OF THE EEL.

GEOGRAPHICAL DISTRIBUTION OF THE EEL.

GEOGRAPHICAL DISTRIBUTION OF THE EEL.

We may therefore provisionally assume the identity of the eels of the old and the new world, and define their distribution somewhat as follows: In the rivers and along the ocean shores of Eastern North America, south to Texas and Mexico, and north at least to the Gulf of St. Lawrence, but absent in the waters tributary to Hudson Bay, the Arctic Sea and the Pacific; present in Southern Greenland and Icelond (7) latitude 65 deg. north; on the entire coast of Norway, from the North Cape, latitude 71 deg., southward; abundant in the Baltic and in the rivers of Russia and Germany, which are its tributaries, and along the entire western and Mediterranean coasts of Europe, though not present in the Black Sea, in the Danube, or any other of its tributaries, or in the Caspian; occurring also off Japan and China and Formosa; also in various islands of the Atlantic, Granada, Dominica, the Bermudas, Madeira and the Azores.

GENERAL NOTE ON HABITS. [Professor Baird.]

GENERAL NOTE ON HABITS. [Professor Baird.]

Madeira and the Azores.

GENERAL NOTE ON HABITS. [Professor Baird.]

The habits of the eel are very different from those of any other fish, and are as yet but little understood.

"This," so far as we know," writes Professor Baird, "is the only fish the young of which ascend from the sea to attain maturity, instead of descending from the fresh to the salt water. Its natural history has been a matter of considerable inquiry within a few years, although even now we are far from having that information concerning it that would be desirable, in view of its enormous abundance and its great value as a food fish.

"The eggs of the cel are for the most part laid in the sea, and in the early spring, the period varying with the latitude, the young fish may be seen ascending the river in vast numbers, and when arrested by an apparently impassable barrier, natural or artificial, they will leave the water and make their way above the obstruction, in endeavoring to reach the point at which they aim. Here they bury themselves in the mud, and feed on any kind of animal substance, the spawn of fish, the roes of shad, small fish, etc. At the end of their sojourn in the ponds or streams they return to the sea, and are then captured in immense numbers in many rivers in what are called fish baskets. A V-shaped fence is made, with the opening down stream into the basket, into which the cels fall, and from which they cannot easily escape. This same device, it may be incidentally stated, captures also great numbers of other fish, such as shad, salnon, and other anodromous fish, to their grievous destruction.

"As might be expected, however, the Falls of Niagara constitute an impassible barrier to their ascent. The fish is

very abundant in Lake Ontario, and until artificially introvery authorant in Lake Ontario, and until artinearly intro-duced was unknown in Lake Eric. At the present time, in the spring and summer, the visitor who enters under the sheet of water at the foot of the falls will be astonished at the coormous number of young eels crawling over the slippery rocks and squirming in the seedhing whirlpools. An estimate of hundreds of wagon loads, as seen in the course of the perilous journey referred to, would hardly be considered ex-cessive by those who have visited the snot at a suitable season essive by those who have visited the spot at a suitable season of the year.

INTRODUCTION OF EELS INTO NEW WATERS IN THE UNITED STATES

In describing the geographical distribution of the cel it was stated that it occurs in the rivers and along the occan shores of North America. This being the case, as might be supposed, there are many inland lakes and streams of the United States in which this fish does not occur; for instance, in the chain of great lakes above Niagara Falls and in the upper waters of other streams in which there are considerable obstructions. The cutting of canals in various parts of the country has, however, produced a great change in their distribution; for instance, it is stated by Mitchell' that cels were unknown in the Passaic above the Great Falls until a canal was cut at Paterson, since which time they have become plentiful in the upper branches of that river. They have also been placed in many new localities by the agency of man. Concerning this Mr. Milter remarks:

"The cel (Anguilla bostoniensis), appreciated in some local-

of man. Concerning this Mr. Milner remarks:

"The eel (Auguilla bostonieusis), appreciated in some localities and much vilited in others, is another species that has been frequently transplanted. It is pretty evident that it never existed naturally in the chain of great lakes any higher up than Niagara Falls, although specimens have been taken in Lakes Erie and Michigan. Their existence there is with little doubt traceable to artificial transportation.

"A captain of a lake vessel informed me that it was quite a common thing some years ago to carry a quantity of live cels in a tub on the deck of a vessel while on Lake Ontario, and they were often taken in this manner through the Welland Canal. He said that it was a frequent occurrence on his vessel, when they had become tired of them, or had procured better fishes, to turn the remainder alive into the waters of Lake Erie. of Lake Eric

cured better fishes, to turn the remainder alive into the waters of Lake Erie.

"In 1871 Mr. A. Booth, a large dealer of Chicago, had an cel of four pounds weight sent him from the south end of Lake Michigan, and a few weeks afterward a fisherman of Ahneepee. Wis., nearly 200 miles to the northward, wrote him that he had taken a few cels at that point. It was a matter of interest to account for their presence, and a long time afterward we learned that some parties at Eaton Rapids, Mich., on a tributary of the lake, had imported a number of cels and put them in the stream at that place, from which they had doubtless made their way to the points where they were taken. The unfortunate aquarium-car, in June, 1873, by means of the accident that occurred at Elkhorn River, released a number of eels into that stream, and about four thousand were placed by the United States Commission in the Calumet River at South Chicago, Ill., two hundred in Dead River, Walkegan, Ill., and three thousand eight hundred in Fox River, Wisconsin." They have since been successfully introduced into California.

GUNTHER ON THE LIFE HABITS OF THE EEL.

Concerning the life history of the cel much has been written, and there have been many disputes even so late as 1880. In the article upon lehthyology, contributed to the "Encyclopedia Britannica," Gunther writes:

"There is no group of fishes concerning the classification and history of which there is so much doubt as the cel family; an infinite number have been described, but most are so badly characterized, or founded on individual or so trivial characters, that the majority of the ichthyologists will reject them."

In his Catalogue of the Fishes in the British Museum, Dr. In his Catalogue of the Fishes in the British Museum, Dr. Guuther has claimed to retain those as species which are distinguished by such characters that they may be recognized, though he remarks that he is by no means certain whether really specific value should be attached to them, remarking that the snout, the form of the eyes, the width of the bands of teeth, etc., are evidently subject to much variation. In his more recent work he remarks, "Some twenty-five species of cels are known from the coast waters of the temperate and tennical games." tropical zones

DARESTE'S VIEWS.

Other recent writers have cut the knot by combining all of

Other recent writers have cut the knot by combining all of the cels into three or four, or even into one species, and it seems as if no other course were really practicable, since the different forms merge into one another with almost imperceptible gradations. In his monograph of the family of Anguilla-formed fishes' M. C. M. Dareste remarks:

"Dr. Gunther has recently published a monograph of the apodal fishes, in which he begins the work of reducing the number of specific types. The study of the ichthyological collection of the Paris Museum, which contains nearly all of Kaup's types, has given me the opportunity of completing the work begun by Dr. Gunther, and of striking from the catalogue a large number of nominal species which are founded solely upon individual peculiarities.

"How are we to distinguish individual peculiarities from the true specific characters? In this matter I have followed the suggestions made with such great force by M. Siebold in his History of the Fresh Water Fishes of Central Europe. This accomplished naturalist has shown that the relative proportions of the different parts of the body and the head vary considerably in fishes of the same species, in accordance with certain physiological conditions, and that, consequently, they are far from having the importance which has usually been attributed to them in the determination of specific characters.

attributed to them in the determination of special states.

"The study of a very large number of individuals of the genera Conger and Anguilla has fully convinced me of the justice of this observation of Siobold; for the extreme variability of proportions forbids us to consider them as furnishing true specific characters.

"I also think, with Siebold, that albinism and melanism, that is to say, the diminution of augmentation of the number of chromatophores, are only individual anomalies, and cannot be ranked as specific characters. Risso long since separated the black congers under the nume of Marcan aigra. Kaup describes as distinct species many black Anguillas. These species should be suppressed. I have elsewhere proved the species should be suppressed. frequent occurrence of melani melanism and albinism more or less

complete in nearly all the types of fishes belonging to this complete in nearly all the types of fishes belonging to this; family, a fact especially interesting, since albinism has hitherto been regarded as a very exceptional phenomenon in the group of fishes. This also occurs in the *Symbranehidae*, I have recently shown it in a specimen of *Monopherus* from Cochin China, presented to the museum by M. Goeffroy St. Hilbiare.

Comm China, presented to the indisculin by M. Goelinby St.

"I must also signalize a new cause of multiplication of species; it is partial or total absence of ossification in certain individuals. This phenomenon, which may be explained as a kind of reachitis (rickets), has not, to my knowledge, been noticed; yet I have found it in a large number of specimens. I had prepared the skeleton of a Comper of medium size, the bones of which are flexible and have remained in an entirely cartilaginous state. Still it is not necessary to prepare the skeleton to determine the absence of ossification, for we can establish this easily in unskinned specimens by the dexibility of the jaws. It is very remarkable that this modification of the skeleton is not incompatible with healthy existence, and that it does not prevent the fish in which it is found from attaining a very large size.

"Those fishes in which ossification is absent are remarkable by reason of the great reduction of the number of teeth, which,

"Those fishes in which ossification is absent are remarkable by reason of the great reduction of the number of teeth, which, although the only parts which become hard by the deposit of calcarcous salts, remain, however, much smaller than in individuals whose skeletons are completely ossified.

"We can understand how much specimens could present characters apparently specific, and that they should have been considered by Kaup as types of new species. These considerations have led me to reduce, on an extensive scale, the number of species in the family.

So, in the genus Anguilla, I find but four species: Anguilla vulgaris, occurring throughout the northern hemisphere, in the new world as well as the old. Anguilla marmorata and A. moree of the Indian Ocean, and Anguilla megalostoma of Oceanica.

Oceanica.

Oceanica.

"There are at least four distinct types, resulting from the combination of a certain number of characters; but the study of a very large number of specimens belonging to these four specific types has convinced me that each of these characters may vary independently, and that consequently certain individuals exhibit a combination of characters belonging to two distinct types. It is therefore impossible to exhibit a combination of the certain individuals exhibit a combination of characters belonging to two

viduals exhibit a combination of characters belonging to two distinct types. It is therefore impossible to establish clearly defined barriers separating these four types.

"The genus Anguilla exhibits, then, a phenomenon which is also found in many other genera, and even in the genus Homo itself, and which can be explained in only two ways:
Either these four forms have had a common origin, and are merely races, not species, or else they are distinct in origin, and are true species, but have been more or less incremingled, and have produced by their mingling intermediate forms which coexist with those which were primitive. Science is not in the position to decide positively between these alternatives." these alternatives.

ANCIENT BELIEFS CONCERNING THE REPRODUCTION OF THE EEL.

The reproduction of the cel, continues Benecke, has been an unsolved riddle since the time of Aristotle, and has given raise to the most wonderful conjectures and assertions. Leaving out of question the old theories that the cels are generated from slime, from dew, from horse bair, from the skins of the old cels, or from those of snakes; and the question as to whether they are produced by the female of the cel or by that of some other waters of fish, it has for centuries leave a question of they are produced by the remails of the cell of by that of some other species of fish, it has for centuries been a question of dispute whether the cell is an egg-laying animal or whether it produces its young alive; although the fishermen believe that they can tell the male and female cells by the form of the snout. A hundred years ago no man had ever found the sexual organs in the cell.

gans in the eer. Jacoby has remarked that the eel was from the earliest Jacoby has remarked that the cel was from the cartiest times a riddle to the Greeks; while ages ago it was known by them at what periods all other kinds of fishes laid their eggs, such discoveries were never made with reference to the eel, though thousands upon thousands were yearly applied to culinary uses. The Greek poets, following the usage of their day, which was to attribute to Jupiter all children whose parties the doubtful was progressive to the the theorem.

culmary uses. The state production and the high was to attribute to Jupiter all children whose paternity was doubtful, were accustomed to say that Jupiter was also progenitor of the cel.

"When we bear in mind," writes Jacoby, "the veneration in which Aristotle was held in ancient times, and still more throughout the Middle Ages—a period of nearly two thousand years—it could not be otherwise than that this wonderful statement should be believed that it should be embelished by pumerous additional legends and amplifications, many of ful statement should be believed that it should be embellished by numerous additional legends and amplifications, many of which have held their own in the popular mind until the present day. There is no animal concerning whose origin and existence there is such a number of fulse beliefs and ridiculous fables. Some of these may be put aside as fabrications; others were, probacly, more or less true, but all the opinions concerning the propagation of the ect may be grouped together as errors into three classes:

The beliefs which, in accordance with the description

as errors into three classes:

"(I.) The beliefs which, in accordance with the description of Aristotle, account for the origin of the eel not by their development from the mud of the earth, but from sliny masses which are found where the eels rub their bodies against each other. This opinion was advanced by Pliny, by Atheneus, and by Oppian, and in the sixteenth century was again advented by Rondelet and reiterated by Conrad Gessner.

"(II.) Other authorities base their claims upon the occasional discovery of worm-like animals in the intestines of the eels, which they described, with more or less zealous belief, as the young eels, claiming that the eel should be considered as an animal which brought forth its young alive, although Aristotle in his day had pronounced this belief erroneous, and very rightly had stated that these objects were probably intestinal worms. Those who discovered them anow had no hesitation in pronouncing them young eels which were to be born alive. This opinion was first brought up in the Middle Ages in the writings of Albertus Magnus, and in the following centuries by the zoologists Letuwenhock, Elsner, Redi and Fahlberg; even Linnaus assented to this belief and stated that the eel was viviparons. It is but natural that unskilled observers, when they open an eel, and find inside of it a greater or smaller number of living creatures with elongated bodies, should be satisfied, without further observation, that these are the young of the eel; it may be distinctly stated, however, that in all cases where eels of this sort have been scientifically investigated, they have been found to be intestinal worms.

ô It is very strange that an observer, so careful as Dr. Jacoby, should denounce in this connection the well-known error of Dr. Eberhard, of Rostock, who mistool a species of zoarces for an eel, and described the young, which he found alive within the body of its mother, as the embryo of the eel. In Jacoby's essay, p. 24, he states that the animal described by Eberhard was simply so intestinal worm, an error which will be manifest to all who will take the pains to examine the figure.

"(III.) The last group of errors includes the various suppo

"(III.) The last group of errors includes the various suppositions that cels are born not from cels, but from other fishes, and even from animals which do not belong at all to the class of fishes. Absurd as this supposition, which, in fact, was contradicted by Aristotle, may seem, it is found at the present day among the cel-catchers in many parts of the world.

"On the coast of Germany a fish related to the cod, Zoarces teliparus, which brings its young living into the world, owes to this circumstance its name Asimular, or cel mother, and similar names are found on the coast of Scandinavia."

"In the lagoon of Conacchio." continues Jacoby, "I have again convinced myself of the ineradicable belief among the fishermen that the cel is born of other fishes; they point to special differences in color, and especially in the common mullet, Magil cephadus, as the causes of variations in color and form among cels. It is a very ancient belief, widely prevalent to the present day, that cels pair with water snakes. In Sardinia the fishermen cling to the belief that a certain beetle, the so-called water-beetle, Dytiscus Rosselli, is the progenitor of cels, and they therefore call this 'mother of cels,'"

SEARCH FOR AND DISCOVERY OF THE FEMALE EEL.

A scientific investigation into the generation of eels could only begin when at the end of the Middle Ages, the prohibi-tion which the veneration for Aristotle had thrown over the tion which the veneration for Aristotle had thrown over the investigations of learned men was thrown aside. With the revival of the natural sciences in the sixteenth century we find that investigators turned themselves with great zeal to this special question. There are treatises upon the generation of the cel written by the most renowned investigators of that period, such as Rondelet, Salviani, end Aldrovandi. Nevertheless, this, like the following century, was burdened with the memory of the numerous past opinions upon the ed question, and with the supposed finding of young inside the body of the cel.

The principal supporters of the theory that the cel was

dy of the cci.
The principal supporters of the theory that the cel was viparous were Alburtus Magnus, Leuwenhock, Elsner, edt, and Fahlberg. The naturalists, Franz Redi and Chrisviviparous were Alburtus Magnus, Leuwenhock, Elsner, Redi, and Pahlberg. The naturalists, Franz Redi and Christian Franz Paullini, who lived in the seventeenth century, must be mentioned as the first who were of the opinion, founded, however, upon no special observations, that the generation of the cel was in no respect different from that of other fishes.

other fishes

In the eighteenth century it was for the first time main-In the eighteenth century it was for the first time maintained that the female organs of the eel could certainly be recognized. It is interesting that the lake of Comacchio was the starting point for this conclusion as well as for many of the errors which had preceded it. The learned surgeon, Sancassini, of Comacchio, visiting an eel fishery at that place in 1707, found an eel with its belly conspicuously enlarged; he opened it and found an organ resembling an ovary, and, as it appeared to him, ripe eggs. Thereupon he sent his find, properly preserved to his friend, the celebrated naturalist, Valisneri, professor in the University of Padau, who examined it carefully, and finally, to his own great delight, became satisfied that he had found the ovaries of the eel. He prepared an elaborate communication upon the subject, which

satisfied that he had found the ovaries of the cel. He prepared an elaborate communication upon the subject, which he sent to the Academy of Bologna.\(^3\)

At the very beginning there were grave questions raised as to the correctness of this discovery. The principal anatomical authority at Bologna, Professor Valsalva, appears to have shared these doubts, especially since shortly after that a second specimen of eel, which presented the same appearance as that which was described by Vallisneri, was sent from Comacchio to Bologna. The discussion continued, and it soon came to be regarded by the scientific men of Bologna as a matter of extreme importance to find the true ovaries of the cel. Pictro Molinelli offered to the fishermen of Comacchio a valuable reward if they would bring him a gravid cel. In 1752 he received from a fisherman a living eel with its belly much extended, which, when opened in the presence of

cel. Pietro Mollielli Olliced to the Issiermen of Comacchio a valuable reward if they would bring him a gravid cel. In 1752 he received from a fisherman a living cel with its belly much extended, which, when opened in the presence of a friend, he found to be filled with eggs. Unfortunately the joyful hopes which had been excited by this fortunate discovery were bitterly disappointed when it was shown that the eel had been cumningly opened by the fisherman and filled with the eggs of another fish. The eel question came up again with somewhat more satisfactory results when, in the year 1777, another eel was taken at Comacchio which showed the same appearance as the two which lind preceded it. This cel was received by Professor Cajetan Monti, who, being indisposed and unable to carry on the investigation alone, sent a number of his favorite pupils to a council at his house, among whom was the celebrated Camillo Galvani, the discoverer of galvanism. This eel was examined by them all and pronounced to be precisely similar to the one which had been described by Vallisaeri seventy years before. It was unanimously decided that this precious specimen should be sent for exhaustive examination to the naturalist Mondini, who applied himself with great zeal to the task, the results of which were published in May, 1777. The paper is entitled "De Anguillæ ovariis," and was published six years later in the transactions of the Bologna Academy. Mondini was satisfied that the supposed fish which Vallisaeri described was nothing but the swimming bladder of the eel in a diseased state, and that the bodies supposed to be eggs were simply postules in the diseased tissue. In connection with this opinion, however, Mondini gave, and illustrated by magnificent plates, a good description and demonstration of the true ovaries of the cel, as found by himself. This work, which is an act of historic justice to state that neither O. F. Müller nor Rathke, but really Carlo Mondini was the first discoverer, describer and demonstrator of the femal

erer, describer and demonstrator of the temate organs of the cel, which had been sought for so many centuries."

Three years later, entirely independent of Mondini, the celebrated zoologisk, Otto Friedrich Müller, published his discovery of the ovary of the eet in the "Proceedings of the Society of Naturalists," at Berlin.

celebrated zoologist, Otto Friedrich Müller, published his discovery of the ovary of the eel in the "Proceedings of the Society of Naturalists," at Berlin.

The discovery of Mondini was next specially brought into prominence through Lazzarro Spallanzani. This renowned investigator, in October, 1792, went from Pavia to the lagoons of the Po, near Comacchio, for the sole purpose of there studying the eel question. He remained at Comacchio through the autumn; he was, however, unable to find anything that was new regarding the question, but in the report upon his journey of investigation he entirely threw aside the discovered by this authority were simply fatty folds of the lining of the stomach. 9

⁷ I fall to find any record of the publication of this paper, except that given by Jacoby, who states that it was printed at Venice, in 1710, with a plate, and subsequently, in 1742, under the fittle "DI ovario Angoillarum," in the proceedings of the Loopold Academy, 's C. F. Muller, Bermbungen, Bei den Intestinal Wirmern.

9 Prof. G. B. Ercolani, of Bologna, and also Crivelli and Maggi, in their essays published in 1872, have rightly stated that Mondinits priority of discovery has been overlooked in Germany. Neither

It was without doubt this absolute negative statement of such a skilled investigator as Spallanzani which for a long time discouraged further investigations on the cel question, and allowed what had already been discovered to be regarded as doubtful, as finally to be forgotten. So when Professor Rathke, of Konigsberg, in his assiduous labors upon the reproductive organs of fishes, in the year 1824, describing the ovaries of the cel as two cuff and collar shaped organs on both sides of the backbone, and in the year 1838 described them as new, he was everywhere in Germany (and to a large extent to the present day) regarded as the discoverr. The first picture of the ovary after that of Mondini, and the first microscopical plate of the egg of the cel, Holmbaum-Hornschuch presented in a dissertation published in 1842—a paper which should be rightly considered as far importance in the literature of this question. The questions concerning the ovaries of the cel may be regarded as having been brought to a distinct conclusion by Rathke, who in the year 1850, published an article describing a gravid female cel, the first and only gravid specimen which had, up to that time, come into the liands of an investigator. 10 was without doubt this absolute negative statement of investigator. 11

ITO BE CONTINUED.

Fishing in Inland Waters.—Concerning the California trout which have been put out in New York waters, Seth Green writes from Rochester to Mr. Chas. F. Inlbrie, of the firm of Abbey & Imbrie, this city: "The fishing in the inland waters will be better this year than last, and within three years you will hear the greatest howl over the California trout that has been heard for years. They spawn in the spring and hatch in a few days, and will fill our streams so full that our followers will have to enlarge their baskets."

REEL FITTINGS.—In our last issue in a reply to a correspondent who wanted something new in a way to hold his reel to the rod, we overlooked the fact that our advertising columns contained an illustrated patent reel plate and rod trimming by Thomas H. Chubb, Post Mills, Vermont, and another by George Hancock, North Adams, Mass., to whose advertisements our inquirer is referred.

Hishculture.

THE SALMON WORK IN MAINE.

THE SALMON WORK IN MAINE.

THE following is an extract from the report of the Commissioners of Fisherics and Game of the State of Maine, for 1881:

For the benefit of such of our citizens as take an interest in pisciculture, we will give a short account of the method of taking our salmon eggs. The Salmon Works are owned by the United States and such individual States as contributed to their construction and arrangement. The whole is under the control of Mr. Charles G. Atkins, Assistant U. S. Commissioner of Fisherics. Each subscriber, whether Prof. Baird for the U. S. Commission, or such of the other States as see fit to contribute, receives a dividend of eggs according to the amount of his subscription. The fish are purchased alive of the weir fisherman at the market rate per pound, at the time when it is lawful to take salmon, and all that Mr. Atkins purchases are just so many fish saved to the State, less the number that may die from bruises received in taking them from the weirs, being fresh run from the sea, and have to be transported in boats carefully prepared to protect the fish from the weirs, being fresh run from the sea, and have to be transported in boats carefully prepared to protect the fish from injuring themselves, as also to furnish them with continued change of aerated water. The fish are transported several miles up a tributary of the Penobscot River into a stream of water known as Dead Brook. About ninety rods of the stream is here divided off by a secure and high fence made of slats, allowing free circulation of the stream; here the fish are confined all through the summer and autumn up to the time of spawning. The water varies in depth from two to fifteen seet. An abundant growth of water plants and overhanging bushes affords shelter to the fish from the direct rays of the sun, in deep pools where the surface water will sometimes indicate in the hottest days seventy-five or even eighty degrees of heat. The bottom of the area of water where the fish are confined all through the same process

Color, become separate and individual bodies like buck shot. They are now washed in several waters, and then spread Rathke nor Hohnbaum-Hornschuch nor Schluser have mentioned his work. S. Nilson, in his Skandianvisk Fauna, 1855, says nothing of Mondini. His mentioned as the first discoverer of the ovaries O. F. Muller, while Cavier, in his "Histoire Maurelle de Poissons," assigning in his work, published in 1828, Die Suswesserfsche von Mittalmond, page 349, that Mondini, almost contemporaneously with O. F. Muller, and independently from him, discovered the ovaries of the eel. The rror, as was discovered by Italian zoologists later than by those of fermany, arose from the fact that the amountement of Muller's discovery was printed in 1789, while that of Mondini, which was made in 1777, was first printed in 1789, while that of Mondini, which was made in 1778, and 1890 the ovaries of the eel, is considered by some to have recognized them; but this, however, is not true, the additions made is not true that the traverse leaflets are wanting than coroneous the eel as he asserts in his last work, contrary to his former description, which was probably based on the law of analogy, and that thereby they are distinguished from the salmon and sturgeon. It is not true, what Rathke likewise asserts, that the genital opening of the eel consists of two small caunis, for I have invariably only found one, which open in the uretura. Rathke has certainly described the eggs quite exactly, distinguishing the larger whitish ones, having a diameter of the contrary of the contrary of the true matter of the ovaries and the eggs, and contrasting them with the fatty formation and with the ovaries and eggs of osseous fish," (Syrski).

upon the trays ready for transportation to the developing house. They are there placed under running water which flows over and under them day and night until the eyes of the incipient fish can be seen without the help of a lens, like two little black dots small as the point of a needle. This period arrives in about sixty days. The eggs are then ready to be sent to the different subscribers. They are carefully packed in layers of gauzo netting, resting on soft beds of damp moss, and can then be sent all over the United States, and even to remote parts of the world like Australia. Penobscot salmon are now swimming in Australian rivers, where no salmon was planted at the creation: where no salmon was even known until the eggs of the Penobscot salmon was planted at the creation: where no salmon was even known until the eggs of the Penobscot salmon were some out and hatched in those waters, and the little fish there carrying out the institucts of its own machinery and wants, went down into the ocean, and thence back to the place that first saw its birth, and thus was established a colony of Maine salmon in Australian waters.

After the eggs are all taken from the fish, their numbers ascertained, which is readily done, as each tray holds in a single layer covering its entire wire surface, a certain number, say two thousand each; counting the trays in use gives an accurate count of the eggs; the books are made up, the expense per thousand will go into the sum of money each subscriber contributed.

The number of salmon bought this year was five hundred

thousand will go into the sum or money each australiant tributed.

The number of salmon bought this year was five hundred and thirteen. One hundred and forty-six of these died from injuries supposed to have been caused by the rude dip net used by the fishermen transferring the fish from the pound of the weir to the boats in which they are delivered at the works. Four were never accounted for, possibly killed by other or mink. In the fall, one hundred and thirty-one males and two hundred and thirty-two females were captured and placed in the tanks.

hundred and thirty-two females were captured and placed in the tanks.

The Penolscot river being the only river on the Atlantic coast of the United States where salmon are left in sufficient numbers to afford a supply of salmon ova to the country, it is deserving of all the protection and care that the State and the city of Bangor can afford it.

We give below the contributions to the Penolscot salmon breeding establishment controlled by Sate and National Government, at Bucksport and Orland for the year 1881:

Maine,	\$2,000.00	Share o	of eggs,	1,080,000
Massachusetts.	500,00	* 6	110	-270,000
Connecticut.	300.00	6.6	6.6	162,000
United States,	1,757.04	6.6	6.0	950,000

LANDLOCKED SALMON.

LANDLOCKED SALMON.

We received from the Grand Lake Stream Landlocked Salmon Breeding Works one hundred and fifty-eight thousand eggs, for fifty thousand of which we are indebted to Prof. Baird. These eggs were hatched and distributed in Cold Stream pond at Enfield, Maranocook at Readifield, Wilson's pond in Auburn, and Rangeley lakes. The landlocked salmon planted in previous years have proved a success, and have been taken at Cold Stream pond in Enfield, Wilson's pond in Auburn, web's pond in Weid. Also several have been taken in the Androscoggin River, at the mouth of Webb's River at Dixfield. Every year they are now taken quite frequently in Rangeley waters. This tish is a very valuable acquisition to all waters where there are large running streams affording them facilities for breeding, and which seem as necessary to their perfect development as to the sea salmon. As a pond fish, without these accessories, it will prove a failure. Maine is the only State that possesses a sufficient stock of this rare fish, of afford its ova to be taken for distribution to other States. An establishment in its conduct and arrangement similar to the salmon works at Orland and under the same superintendent, is successfully carried on at Grand Lake stream in our State. As this is strictly an inland fish, which does not migrate to the salmon works at orland and under the same superintendent, is successfully carried on at Grand Lake stream in our State. As this is strictly an inland fish, which does not migrate to the same and that twenty-five per cent. of all the ova taken shall be hatched and distributed in the same waters.

As a matter of interest to the reader, we give below a list of the contributors for 1881, with the dividend of eggs to each subscriber:

Maine,

Sono,00 60,000

Maine,

Sew Hampshire,

Sono,00 60,000

Maine, New Hampshire, Massachusetts, Connecticut, United States,	\$300,00 250,00 500,00 500,00 1,450,00	60,000 50,000 100,000 100,000 290,000
United States,	1,450.00	290,000

In conclusion we would suggest to any anglers taking a landlocked salmon in waters stocked by the Commissioners of Fisheries, that they carefully return them back. In this way, we may expect in a few years to see good salmon fishing in our inland waters, and while we are on this subject, allow us to ask the aid of all our citizens in preventing the destruction of the young sea salmon by boys. We do not wish to be understood that they are wantonly destroyed, but from actual ignorance that they are young salmon. Indeed, they are sometimes sold as trout. They may readily be distinguished as having minute and bright red spots, dark cross bars, and are often mistaken for trout.

NATURAL FOOD FOR FISH PONDS

NATURAL FOOD FOR FISH PONDS.

In order to stock our waters intelligently it is necessary more fully to study the character of every lake, pond, river, reservoir or other waters in regard to its character and capacity to produce fish. What is its temperature, what does it now produce in the way of iish, and what would be better suited to it? What are its present productions—vegetable, infusorial or insect life—that will furnish food for fishes; and what of these that, if introduced, would find a suitable home, to make painer what I mean, let us examine one of our smaller lakes. We find a few bass and wall-eyed pike, but we find them in small numbers, of small size, lank, lean, and with a ravenous look. These facts give us evidence that, while the water is suited to produce these valuable fish, the food on which they live and thrive is wanting in their haunts. They are carnivorous. They live almost wholly upon minnows, and these we will find almost, if not entirely, wanting. In our explorations we find a bed of water plants. We pull one up and find it covered from end to end with small insect life—too small to be of any use to the carnivorous ishes, but precisely what would delight the stomach of a smelt and make him a fish paradise. We introduce the smelt. He lives, thrives and grows, and in a short time the waters will be swarming with young smelt. We dip up a paddle full of mul from the bottom of the lake and we find it filled with small red worms and other forms of infusorial life. We know that this is the food of the buffalo, red horse and sucker. We at once introduce a few large buffalo. He finds these rich banks of mud and infusoria much sooner than we could, and, turning his tail to the surface of the water, he soon fills himself with the portion of the bank richest in that nourishment on which he lives and thrives. Soon we shall have added to the lake millions of young and many large buffalo. Again, we find varieties of render water vegetable-feeding fish live and thrive. We at once introduce the earp. H

various conditions we may find, but we are now turning the insects into smelts and minnows, the infusoria into bulfalo, redhorse and suckers, and the water vegetation into carp and other valuable varieties of vegetable-feeding fish. But I think I hear some one say, "I do not like suckers or redhorse—they are poor food, and the bulfalo is little if any better, and the carp and smelt are too much in the future and so are only speculative." Very well, my friend. I shall tell you that these fish are much better than the insects, infusoria mud, or water vegetation for human food; but those are not the results we were aiming at—they are still to follow. Some day one of the lank, lean bass, which has been living upon his own young until there are no more to lire upon, pressed by a voracious appetite, determines to change his diet. He catches a young smelt. In place of the hard, scaly armor of the young bass he finds the soft body of the snelt; instead of the stiff, sharp-pointed, spine rays of bass fins that so otten have very nearly taken his life as he has gorged his old food, he finds only the soft, velvety fins of the new. He needs no further argument to cause him to henceforth forswear the bass and take to the new food. He took the old, obuxxious, unnatural food sparingly, for the labor and pain of taking it made him do so. This caused his former small, lank and lean condition; and because he took the young bass for food, you have a reason for their former scarcity. The cating of the new soft-rayed finned fishes is a luxury, and their plentifulness insures him a full meal with but little labor, and with these conditions he will soon grow in size and fatness, while the innumity given to the young bass will eyed pike, salmon, brook trout and other valuable fish from the insect, the infusoria, the vegetation and other sources of food by simply furnishing missing links.

Is there anything further we may do upon the ground, or rather water, we have just gone over! Let us see. Suppose, when we pulled the weed, we found

SALMON IN SCOTLAND.

A PRIVATE letter from Mr. A. W. Armistead, the gentle-man who brought over the turbot and soles to America last season, informs us that he soon sails for South Africa. In relation to the spawning of salmon he writes:

The River Firth Fishery Board have sent down word to my brother that the salmon are now up spawning, so he is going this week to try for sonc—we have early and late spawners in the Firth, some spawn October and November, and then there is another run in January. Forest And Stream has just arrived now while I am writing. A new line of steamers I think will run before long from Milford Haven to New York to make the passage in about six and a half days—this might be worth noting down perhaps, in case another attempt is made with the soles and turbots. Must not add more—hust write you again before sailing. My brother will do anything he can in connection with the sole and turbot experiment.

A. W. Arbistead.

A. W. Armistead

CARP IN GEORGIA.-Mr. A. A. Wright, of Georgia, "Thave eary weighing from six to eight pounds, two and three years old, and they have a nice palatable flavor, and from experience with other fish they suit our Southern waters better than any I have tried. All our Germans here are advocates of carp.

DOG RACING

THE staid inhabitants of the "City of Brotherly Love" occasionally indulge in a little decorous recreation. Last week it was a dog race. The Philadelphila Times gives us a synopsis of some of the heats as follows:

Watch and Park's Dash were prepared for a start. Watch, a half-breed Newfoundland, being the largest dog, had to run the full course, 175 yards, and Dash, a setter, was given "44 yards start. At those points the dogs were held in silp, while their masters, after allowing them to smell a live rabbit and a pigeon, ran towards the end of the course. Ten or a dozen yards from the end the owners of the dogs stopped, the pistol went off and the dogs started. Watch made a bee line for his master, but Dash wanted blood, and instead of racing toward home turned and charged full tilt upon his rival. The dogs rolled over and the crowd yelled with excitement, but an instant later Watch struck his feet and, resuming the race, darted on toward his master, followed savagely by Dash. Watch crossed the string first in 174 seconds, but half a second later the defeated dog was on top of the victor and feeding on his left ear. The dogs were separated annid the cheers of every one except the owners of the racevs. Jones' Nell, Smith's Just in Time and Hicks' Sport were the starters in the second heat, the first named being at the scratch.

Jones' Nell, Smith's Just in Time and Hicks' Sport were the starters in the second heat, the first named being at the scratch.

They started evenly. Sport, a lurcher, that is said to have been a clever racer in years gone by, soon pushed to the front, with Nell six yards before Just in Time when the first hundred yards were run. The crowd yelled, "Sport winst" and "Twenty to one on Sport," but before the first shout died away a man, who had evidently attended dog races before, gave a sharp whistle as the lurcher passed him. The dog half halted in response to the call and swerved momentarily, but that halt and swerve, brief though the time was, allowed Nell to flash past and cross the tape a yard in front of Sport, who seemed to recognize the error he had made and hung his head and tail guiltily when he approached his master. The unexpected result of this heat brought the excitement up to a fever heat. Nell ran her 105 yards in 11 seconds. Nixon's Joe Buckley and Cartwright's Old Spring raced for the next heat in good style, but the latter, who had the best of the handicapping, won by several yards.

Tyler's Let Me Go, Johnson's Bess and Davis' Nelly came next, and the first mentioned won so quickly and with such ease that the spectators could hardly believe their eyes. Sho nothing but her master at the other end of the course with a rabbit in his hands. She went off with the pistol, shot by her rivals like an arrow and had finished her part in the race before they were fairly going. She won the final heat and handicap with even greater case than she did the first trial. So amazed were the spectators at her speed and the straightness of her course that they forgot to take the time of the last two heats.

PUBLISHERS' DEPARTMENT.

The American Arms Company, of Boston, Mass., are making a single-barreled, semi-hammerless gun, which they furnish at a low price. The firm is well known in connection with the Fox gun.

GORDON SETTERS.

Editor Forest and Stream:

Editor Forest and Stream:
In your issue of Feb. 23 I notice an article by Dr. Niven on
the Gordon setter, in which he asks several questions about
this grand field-dog. Being a great lover of field sports and
owner of some fine field-dogs, my experience of many years
in breeding this dog, and in hunting over them in the North,
South and West, I consider a sufficient reason why I should
be entitled to express my opinion and answer the above-named

gentleman's article, and to assist in placing the Gordon before your many readers in his true light. His first question—"Is it necessary that a Gordon setter should be a heavily-built dog?" Certainly not, if you wish him for field-work; but from a bench point of view, one would be led to think differently; the bench show dog is much too heavy for field-work; some of the prize winners of the present day weigh from 68 to 75 lbs. How many hours' work, do you suppose, such a dog capable of performing, and what chance would he have by the side of the nicely-made field Gordon, weighing only 50 lbs.? The latter dog would surpass him in all field-work by long odds. Who, pray tell me, would wish to start on a hunt with two of these heavy Gordons in their wagons, when they can get the same breed and color, with lighter frames, swift as the racers, with nose surpassed by none, and powers of endurance equal to any strain in this country or in Europe. Tbelieve the craze for large dogs for the bench has been the cause of so many comments on this strain.

Secondly, he asks, "What advantages are to be gained by breeding thus?"

I will say positively none; every step taken toward the heavy dog is ruinous to any strain of field-dogs, unless you are breeding for the style and speed of the cart-horse.

Thirdly, he asks, "Are the Gordon setters of to-day as good in field as when a little white was allowed on chest or feet?"

The light-weight Gordons are good field-dogs, whether it is with a frill or toe of white. I certainly—speaking in a field point of view—would not destroy one so marked, nor a black-white and tan dog, if of proper size. My preference is always for the Gordon with as little white as possible. I think it wrong to debar such from competing at shows. Fellow-sportsmen, a good Gordon cannot be of a bad color; color will not spoll his field-work. Many pups are destroyed for a white chest or foot; save them, and many you will find, at two years old, have lost the white hair; it will have grown out; turn your attention m

GROUSE DALE.

WE give our readers this week a sketch by the well known artist Mr. J. M. Tracy, of the celebrated setter Grouse Dale, which we need scarcely say is a speaking likeness. Grouse Dale, won first at the late Eastern Field Trials on Robbins' Island. He won the puppy stakes at the inaugural meeting of the Eastern Field Trials Club in 1879, and was second with Aldrich's Sunt in the braces at the same meeting. He also ran at the same trials in 1880, but was not placed, although he ran a grand heat with Gladstone, except that he was unsteady at the finish. At the last meeting on Robbins' Island he ran all of his heats in good form, vanquishing such noted performers as Croxteth, Maida, Lizzie Lee and others. He also ran at the late National and Pennsylvania Trials at Grand Junction. Tenn., but was so heavily handicapped by his long journey and want of rest that, although he showed some remarkable good work he was unplaced in the national all aged, winning with Dashing Monarch third in the brace and dividing second with Warwick in the Pennsylvania all aged. He has been shown on the bench but once, capturing a v. h. c. at New York in 1880, in a large and very good class, his sire, Waters' Grouse, being placed first in the same class. His dam, Daisy Dale, won second at Philadelphin in 1877, and is a full sister or Diana, the dam of Pollux, who won the Derby at the last meeting on Robbins' Island. Grouse Dale is a handsome dog, rather above the medium size. He is nearly white, with lono—orrather rance—markings, and is now three years old. His action while roading game and his style while on point obacking is magnificent. He is very intelligent and obedient and has a capital nose, and is always in the best of health and spirits and ready for the field at a moment's notice. He is owned by Mr. Wm. A. Buckingham, of Norwich, Comn., and was trained by Mr. Wm. A. Buckingham, of Providence, R. I. WORMS IN PUPPIES.

GROUSE DALE.

WM. A. BUCKINGHAM'S GROUSE DALE.

their not being placed, but because they are not owned by men whose principal hobby is to have a trainer and see his dog hunted once a year. But they are owned by practical lunters, and many by those who have not the means to gratify themselves in yearly field-trial amusement. Then, again, they are owned by men who would attend but their time is not their own. If the Gordons, with field form, had the same labor expended for them, as dogs of other strains, they, to my mind, would do much better nose-work than what we read of at many yearly trials.

Sixthly, he asks, "Have the English setters so much improved, or have the Gordon setters retrograded?" The Gordon is as good for field-work to-day as he ever was, and is the peer of the English in many respects. I believe you can get more first-class field-dogs out of a litter of Gordons than you will ever get out of Euglish or Irish.

To queries seven and eight will say, in order to improve the Gordon for the bench, have the standard changed for a lighter and more racy-looking dog. Fellow-lovers of this dog, it is the dog on the bench, with his immense frame, that has made him unpopular with many that have purchased them for field-work. We have in this country as fine field Gordons us any one could wish for, and wherever owned they are very highly prized.

Baltimore, Md.

Baltimore, Md.

TRACY'S SKETCHES,—Mr. J. M. Tracy, the well-known artist, has just issued the second pair of the series of hunting scenes which he is publishing. One of them, "A Hunting scene in Tennessee," is a striking picture of the well-known Gladstone and Peep o' Day. The other is a capital delineation of Minnesota chicken hunting, with Dash III, and Countess May in the foreground. The pictures heretofore published by Mr. Tracy have mut with a very cordial reception from the sportsmen of the country, who recognize a 'master hand' in the truthful as well as pleasing portrayal of the animals represented. There has been such a call for these pictures that Mr. Tracy has found it impossible to supply the demand as promptly as he would like. He has now made arrangements for increasing the production, and will soon be able to fill all orders as soon as received.

A CONSCIENTIOUS DOG.—A faithful Newfoundland dog spent the night on a pond in Connecticut, recently, guarding the coats of a party of fee-cutters. He refused to leave them when called away, and in the morning he was found at his post budly frozen. That dog was a noble philanthropist, he probably knew that the icemen would seize on the fact of an axe or saw being lost to raise the price of ice in the summer, and he averted the calamity.—Ohristian Union.

THE BOSTON DOG SHOW.

THE BOSTON DOG SHOW.

THE third bench show of dogs which is to be given by the Massachusetts Kennel Club, at Music Hall, May 9, 10, 11 and 12, promises to be a grand one. The classification list is now in course of publication, and will be one of the most complete ever offered.

The club, after due consideration, have decided to give handsome certificates of award in the following order: First, second, third, very highly commended, highly commended, and commended, to each of the different classes in their list. The judges will be particularly instructed not to give those awards unless the dogs come up to the proper standard of merit.

awards unless the dogs come up to the proper standard of merit.

The classes number ninety-six against sixty-three of the last show given in Boston. The following other classes will be made champion classes: For heavy and light weight pointers, black spaniels, heavy and light weight champion fox-terriers, champion mastiffs, champion St. Bernards, champion buildogs and bult-terriers; also same to pugs, Skyes, Cyrkshires, and other breeds; a class will be made for the new breed of dogs, the famous berghunds, which have been extensively imported into this country by Mr. Lorillard and other gentlemen.

The prize list will soon be ready, and an office opened which will be duly announced. Mr. Chas. Lincoln has again been appointed Superintendent for the show. He reports that a great amount of interest is already being taken in the show from various parts of the country.

already being taken in the show and all country.

Special invitations will be sent to England so as to make a truly representative show of all the best dogs in the world.

The entries will close April 3.

All communications should be addressed to E. E. Hardy, Secretary, P. O. Box 1,793, Boston, Mass.

NEW YORK DOG SHOW.—A special prize of a club medal will be given for the best greyhound puppy under twelvo months, also a medal will be given for the best Chesspeake Bay dog or bitch. This class of dogs was unfortunately left out in making out the prize list. Thomas Orgill, Esq., of Brooklyn, will judge the classes for spaniels in the sporting division. Please state that the P. O. Box is No. 1,625, where all communications should be addressed.—Chas. Lincoln, Supt.

LAVERACK PEDIGREES.

LAVERACK PEDIGREES.

I NOTICE in your issue of Feb. 23, a very interesting communication from "East" on the pedigrees and colors of Laverack setters, and, as he in the commencement of his letter corrects you in regard to the color of some of Pride of the Border's get, so now I take the liberty of correcting him in regard to the color of Adams' Rock. After a long line of reasoning, "East" says: "We might add a strengthener to this side, by bringing another example in the shape of Adams' Rock, a liver and white dog by Bruce out of Daisy. Bruce was by Dash II. out of Statler's old Phoebe, and Daisy was full sister to Countess and Victress. Now, where does this liver come from, etc?" I would inform "East" that Adams' Rock (now dead) has nothing to do with this Laverack setter color question, for in the first place, he was not liver and white at all, but lemon and white; and again, he was not a pure Laverack. Mr. Laverack has passed that bourn from which no man returns, and he cannot speak to defend, and that grand old dog, Pride of the Border, which he sent to Mr. Raymond, has passed to the happy hunting grounds; and now, after all these years of slumber, the truth of the one, and the pureness of the other, is held up for rivals to pick at. I am rather of the opinion that Pride can rest in his grave with peace, and trust to his descendants, be they of whatever color they may, to tight the battle of his breeding.

CLAREXIONT, N. H.

Owing to the recent controversy in regard to the Laveracsk

CLAREMONT, N. H.

Owing to the recent controversy in regard to the Laveracsk and their colors, permit me to mention, if of any interest to you or you readers, that I have a dog, liver and white, which color I attribute to the Laverack blood. The dog referred to, Dolph by name, is the produce of in-breeding after a direct cross, he being bred from brother and sister, (by different litters, however). Fred and Kate, black and tan. They by Dan out of Ruby. Dan, by Dandy ut of Die; Dandy, by Jobing's Dandy, ILOrd Rosslyn blood) out of Langstaff Moll, etc. Die, dam of Dan, has clear pedigree back to the Duke of Gordon's Dandy. Boady and Die were purchased by Dr. J. H. Gautier of J. D. Kedward, Esely Courf, Michel Clurch, Esely, Hert-ord, England, and were pure Gordon, while the dam of Dolph was by Mystery out of Cora, born May 12, 1871, and was bred by Mr. Edward Laverack. Cora is own sister to (Q. C.) Mr. Garth's Daisy, and to Porcell Llewellin's Countess and Nellie, Cora by Laverack's Dash, out of Laverack's Moll III., etc. Mystery, bred by Mr. Laverack, by Ls. Jet, out of Duchess, and so on back to old Moll and Ponto. And to conclude, as I cannot find any traces of liver and white on the grand sire, think grandma is to blame.

PERCY C. Ont.

THE NEW YORK DOG SHOW.—Brooklyn, Feb. 27, 1882.

think grandma is to blame. PERGY C. ORL.
PLANFIELD, N. J.

THE NEW YORK DOG SHOW.—Brooklyn, Feb. 27, 1882.
—Editor Foyest and Stream: At the Westminster Kennel Club
Shows, with but one or two exceptions, the sporting dogs have
been divided into two classes. Namely, the aged and puppy
class. One of the exceptions is the English greyhound. Being
desirous of entering some of my puppies in the coming show,
yet feeling they could not compete with full grown dogs with
any chance of winning, I addressed Mr. Lincoln, the superintendent, asking him to present the matter to the club and if
possible have a puppy class formed. He very kindly wrote
me on the 23d inst, that he had submitted the subject to the
managers and they had decided to give a club medal for the
best English greyhound puppy under twelve months old. He
regular class for greyhounds, and all puppies will be afterward
judged separately. They will also be allowed the privilege of
competing in the aged class." At the last show the display of
greyhounds was exceptionally fine, and now that we are to
have a puppy class, I hope that it will be a full one, and thus
bring into sharper competition these dogs which, beside their
great beauty, afford their possessor the double pleasure of companionship and usefulness. The recent sales at Aldrich's show
in what high esteem and value these fleet and graceful dogs are
held by our British cousins, and I look forward to the time not
are discussed by the competition that the supplies are
held by our British cousins, and I look forward to the time not
are discussed by the competing that the supplies are
held by our British cousins, and I look forward to the time not
is now strange.—H. W. HUNTINGTON.

DOGS POISONED.—Willow Lake Kennel, Plainfield, Feb. 22.—Eddtor Forest and Stream; I penned you last week with sorrow, the death of my stud dog Lord Percy; and now I must add among the gone but not forgotten, the black and tan Gordon, Tom, whose death will be read with sorrow by the many who have enjoyed his company, and also the promising young dog Guy, the property of Mr. James R. Brady, is a 'loss never to be replaced. The sudden death of Lord Percy, and his action as described to me, caused me to report that it was pneumonia that killed him. A post mortem on the last two shows poison to have been the cause, and as Lord Percy's actions were the same, it is safe to assume it was poison that killed him. Sir Lancelot and several other noted dogs have also been ill, but are recovering. But I hope the three which have fallen victims to this scoundrel's work may satisfy his desire, for if the inteution was to injure me he has certainly accomplished the purpose, or if done for the purpose of robbing, I think the perpetrator deserves reward, and trust it will be my lot to serve it to him. "I know I could graciously,"—PERCY C. OHL.

COUSLY."—PERCY C. OHL.

COCKER IMPORTATION.—We noticed some time since the proposed importation of two of Mr. Arthur H. Easten's black spaniels, Beau and Blackie. Both of these dogs have been great winners on the bench in England. They were shipped from the Beverly Kennels, England, Nov. 14, and reached the Riverside Kennels, at Claremont, New Hampshire, Dec. 10, 1881, in good condition. Beau and Blackie are evenly matched, are jet black in color, with but little white on the chest; have flat glossy coats with excellent feather, and are made after the latest fashion, with short, sturdy legs and long, well-shaped bodies. They give indications of very high breeding. Beau is the sire of Beverly Bess, for which Mr. Easten refused £70 (8250) at the last Manchester show. Beau is also winner of twenty-two prizes and cups, and has sired a number of prize winners on the English show bench. Blackie is also a noted prize winner, having taken first at Manchester, Eng., just previous to importation, winning twenty-one prizes and cups in all.

PRIORITY OF CLAIM TO NAME.—Feb. 20.—Editor Forest and Stream: I see by the Forest and Stream, that Mr. Smith, of St. Louis, wishes me to change the name of my puppy Brian Borou. Am I under any obligation to do so. I have special reasons for not wishing to.—John Goold. [We fail to see any good reason preventing any one claiming any name for his dog he may choose. In case two or more gentlemen should chance to select the same name for animals of the same breed, it seems to us that they have a perfect right to do so, and no confusion can possibly arise if the owners will in such case prefix their own names to those of their dogs, thus Mr. Smith's dog should be known as Smith's Brian Borou, and Mr. Goold's dog as Goold's Brian Borou, by pursuing this course it would be impossible that any mistakes of identity could transpire.]

THE POINTERS BOW AND JAUNTY.—Mr. Edward Odell, of New Orleans, La., writes us that he has purchased of the St. Louis Kennel Club the celebrated pointer, champion Bow and the bitch Jaunty, the latter in whelp to Faust. We congratulate Mr. Odell upon the acquisition of so good a pair of dogs. We understand that Bow will not be withdrawn from the stud and the breeders of the Southwest will undoubtedly eagerly embrace the opportunity to secure his services.

COCKER SPANIEL PRODUCE STAKES.—The Hornell Spaniel Club enters the cocker spaniel Lady Bath, in whelp to Bob III. in the Cocker Spaniel Produce Stakes. Any person having cockers who has not received a copy of the conditions of the stake, will oblige by sending stamped envelope, and copies of the circular will be furnished at once. James Watson, Secretary, A. C. S. C., 453 W. Forty-third street, N. Y.

PEDIGREES.—We have received a large number of pedigrees in response to our request for them, and tender our thanks to the senders. We find them very useful for reference as often they contain information that cannot be found elsewhere, and we trust that our readers will continue their favors and send us copies of the pedigree of all of their dogs.

KENNEL NOTES.

We wish to impress upon the minds of those who send us items for our Kennel Notes, that to avoid mistakes all names should be written in prarts Letters, as we find it very casy to make mistakes where this is not done. We also would like to be informed whether the animal is male or Female, and to know the date of birth and the breed to which it belongs, whether pointer, setter or other. A careful study of the notes in this number of the paper will show just what is wanted.

is not done. We also would like to be informed whether the animal is male or female, and to know the date of birth and the breef to which it belongs, whether pointer, setter or other. A careful study of the notes in this number of the apper will show just what is wanted.

NAMES CLAIMED.

Hachting and Canoeing.

THE YAWL IN AMERICA.

THE YAWL IN AMERICA.

[CONTINUED.]

DERHAPS the readiest explanation of what the yawl rig really is can be given by referring the reader to the accompanying cuts. In point of principle, the special features consist of a mainstail, which is really the main sail, and inboard entirely at that; a small sail of some sort rigged over the stern, its mast stepping anywheres from rudderhead ari, and headsail such as may be preferred. The principle of the stern is mast stepping anywheres from rudderhead ari, and headsail such as may be preferred. The principle as the entire sail is made so small that the vessel large, vanish as soon as the after sail is made so small that he age or handherchief flung to the breeze over the counter, and all recommendations of the rig have no longer any force. To obtain the benefits of the yawl, the after sail is made so small that are gor handherchief flung to the breeze over the counter, and all recommendations of the rig have no longer any force. To obtain the benefits of the yawl, the after sail is made yield the property of the property of the property of the readercous shem, likely to get the skipper into trouble.

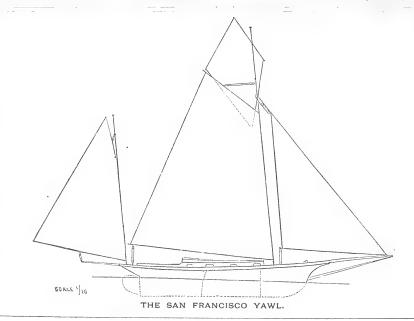

In Great Britain the custom of allowing yawls one-fifth of their ton-mage free of tax in racing has lead to the introduction of a sail plan which, while technically a yawl, and the recipient of the one-fifth deduction, is, in point of facel, hittle class but a cuiter. For racing, the few square few secretical in the mainsail have been found an advantageous vawls flourish to a great extent among foreign racing men. Line can be said in their favor, for their mizzen is too small to gain them the sympathies of the cruiser, and their mainsail is docked too much to suit the lancy of those who wish a full-fledged cutter, and nothing short of one. With sail plans of this sort we have now nothing to do, and our advantage one of the cruiser, and their mainsail is docked too much to suit the lancy of those who wish a full-fledged cutter, and nothing short of one. With sail plans of t

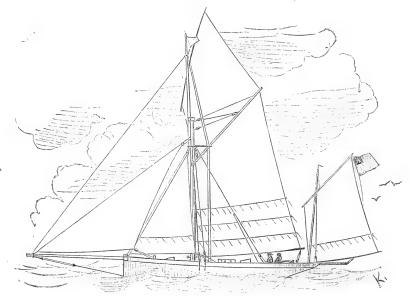

We are a practical nation, and very fond of considering ourselves such; and if trial develops what we claim for the yawl, we see no reason why its popularity may not be counted upon for the future just as soon as once fully understood. We will lay before the reader ample facts and testinony of a home source, so that our choice of this right of the property As Stakes.

And Stak

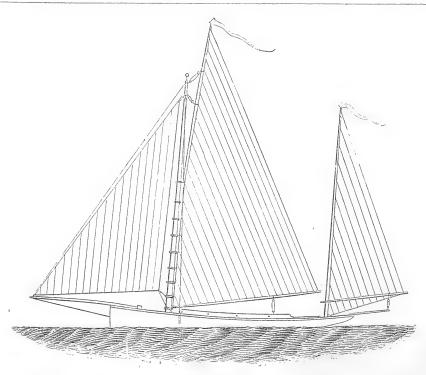

AND STREAM Some years ago by Mr. Yale, Secretary of the San Francisco Y. C. His long experience serves to render him an authority worth quoting:

With jib activer alone your boat is under command, there being With jib act of cauves to form working sails. This, of course, is as handy as possible in getting under way of samm him of the parent to every yachisman, the bulk of canvas being off the loc. as we all very well know, one never reefs until the last moment, and is ago to hold on to it too long on account of the bother. Nobody ever reefs a sloop f he can help it, of course, and the longer the boat the bigger the job, In case we settle away to reef the mainsail in the yawl, we keep right on our course with driver and jib, and all the yawl, we keep right on our course with driver and jib, and all the yawl, we keep nay be will recognize when man along easily. In the passing an earing inboard or outboard in a lumpy sea and fresh breeze. At no time do we lose control of our vessel, as in laying by under a jib in reefing a sloop. It is very convenient to coar a boat through a squall with driver and jib by flowing the main sheet and getting the bulk of the canvas off her by letting it shake. With a squall abeam, for instance, flow your main sheet, but keep on your mains. If the wind comes too heavily, lower say your mainsail on the day of the passing harmiesly between your mains.

THE BRITISH YAWL.

THE CLAPHAM YAWL.

Acres 2, 1882 |

Like in your driver alone and sail under mainsail and jib, which would put you in shape like a reefed sloop. Your sails must be properly belanced to enable you to do all this. Your yachs will then work well under any of these circumstances.

The driver nets as a very efficient lever, being so far outboard, and as it is entirely under control, can be used to great advantage in doing short work, as among whorves or vessels. A very slight pull on your driver to winward will swing you wonderfully quick, which will come in very handy in cruising about in a light breeze, or if you happen to get a stern-board on. If you wish to back out of a slip—stage of the contention for you to do—by bringing your driver square services nortested for you to do—by bringing your driver square services nortested for you to do—by bringing your driver square services nortested for you to do—by bringing your driver square services nortested for you to do—by bringing your driver square services no manuer to surprise any lookers-on.

The driver is very handy in other ways as well. If you wish to stop and wait in a moderate breeze without lowering your sails you can come up on your jib and main sheefs, haul your driver flat aft and tell represent. She will then lie head to wind and will pay off enough to let her head sails fill, the driver being so much outboard aft throwing her head up the instant it begins to pay off. At the same time there is not muon sail for the wind to take effect on. If alone, you or an oar, or pack up a duck; your may saie with any touchood to an oar, or pack up a duck; you may saie with any touchood to an oar, or pack up a duck; you may saie with any touchood to wind your walks or your boat coming to grief during your rails or your boat coming to grief during your sails or your boat coming to grief during your sails or your boat coming to grief during your temporary absence. If you beat up into a marrow slip or creek and want to turn square in your wake, haul your driver, and your jib will turn ine

YACHTING IN SAN FRANCISCO.

WACHTING IN SAN FRANCISCO.

Editor Forest and Stream:

In some respects, at least, we are setting an example here in San Francisco, which might well be followed by your older cituls in the East. We metsoveral times during the whiter months to listen to leatness delivered by members who are proficient in technical al large audience composed of the club members and others interested, a large audience composed of the club members and others interested, a discourage upon a paper read by Mr. Dixton Kemp before the London Institution of Naval Architects. The Dixton Kemp before the London Institution for Naval Architects. The Dixton Kemp before the London Institution for Naval Architects. The Dixton Kemp before the London Institution for Naval Architects. The Dixton Kemp before the London Institution for Naval Architects. The Dixton Kemp before the London Institution for Naval Architects. The Dixton Kemp before the London Institution for Naval Architects. The listeners in a very acceptable manner; as Mr. Oliver is by profession are engineer, and heliga also a scientific yachtsman, the subject was treated by him in a thorough manner. As you may suppose, a great deal of discussion arrose in consequence. Mr. Oliver held with Mr. deasy form of hull was productive of the best seagoing qualifies. In fact, he agreed allogether with the principles set forth from time to time in Fousser and Straum. Now you know we have here many professional men, ship builders, sea captains and others, whon your resistant deep type, but the old school of bean and flat bottom, is of strong gales, shoals, and comparatively smooth water in which on yeaching is done, the old school has an advantage in referring to existing customs and practices, which are all on their side. If we had more outside cruising to do, and made regular sea voyages as the favor of deep yachts would have a nuch stronger case. At all events are not likely to be built from, the originators of the project having are both narrow and shoal in our strong winds. The inversal prof

Innovations in our regaltas and may throw them open to all conversibility this idea does not seem pounting allogather, as it would give an undestrabile element a chance at the prizes. Of starmy metric we have undestrabile element a chance at the prizes of starmy metric we have every little, as we all profer salling, our clubs being thorough. Corincians who go in for the sport with keoner relish than your Eastern nabols who seem to care more for getting from port to port than for the practical enjoyment of working their own yanchs. In our entire fleats we have only one professional captain, he aboard the 90ft. Schooner Caseo, belonging to br. Merritt, of Oakhand. By the way, you met the Doctor when he was East recently. He still thinks as or two in her this year, his last ventures in this way having go such a success and so much enjoyed by himself and a party of five ladies. One of the ladies has written up the log of her cruise mentertaining style, and we would rejoice to see it published. We have our Mrs., or rather in this case, our Miss, brassy just as well as the English, and we are a little prond of the fact. The Frolic Commodore Harrison's syank, has, of course, been in commission all the year round as usual, as the start of th

ABEEL TROPHY MATCH.—Terms: Open to teams of ten (10) men each; number of teams from each company unlimited; each team to pay entrance fee of one dollar and pay for its own ammunition, which must be such as is used for armory practice; seven shots per man at 200 and 500 yards; no sighting shots; positions as usual; Remington rifles asissued. All competitions to take place at the armory between Nov. 1, and April 1. Winning teams to have possession of trophy for 30 days, subject to challenge at any time after 20-days, and the challenging team shall notify the Inspector of Rifle Fractice so that at least 10 days shall be allowed the challenged company for preparation. Should more than one challenge be received, the Inspector of Rifle Practice shall decide precedence, and appoint date for each company to shoot.

Company B Team,

ISS2, under supervision of Capt. J. Le Boutillier. Regimental J. R. P.

PISTOL PRACTICE.—Several letters on this topic have been re-elved, and will be printed in our next issue,

CONLIN'S GALLERY.—The]rifle' tournament which has been in progress at Conin's rifle and pistol gallery, 1,285 Broadway, corner Thirty-Inst street, was brought to a close Feb. 18. It proved a great reserve class of rifle-shooters an opportunity.

Ten prizes were offered for the ten (10) best targets made with rifle held strictly off-hand, with the under arm free from body.

The same number of prizes were offered for the ten (10) best targets made with rifle same number of prizes were offered for the ten (10) best targets made with rifle held in any standing position without artificial rest. Five prizes were given to the competitors making the best score with rifle the prizes were offered for the ten (10) best targets were given to the competitors making the best score with rifle the rifle and the standard position without artificial rest. Five prizes were given to the competitors making the best score with of the competitors for the other prizes took a trial at the "go as you please," and the way they went was hard to follow. Positions and rests were invented and brought into use which would have puzzled the most acrobatic of Creedmoor long-range marksmen. Conlin's ready measurement targets were used. It enabled the shooters to measure each shot from centre of bullseye to centre of shot very actual good the best. Any 22-100 callibre rifle was allowed.

The following name and scores show the winners of the respective kinds of shooting:

Strictly Off-hand.

Strictly	Off-hand.
Inches	
 Dr. E. T. T. Marsh 4 6-1 	
Dr. Fred, T. Brown 4 12-1

the past records. The deliberate	aim match was a very close contest,
and the scores of the winners will	deserve the trophies which they won.

ALBANY.—Third match for the Maynard rifte at Rensselaerwyck. When the practice commenced yesterday, the light was dazzling bright, and the reflection from the snow, which covered the range and the hills beyond, made sighting extremely difficult. The outlines of the targets were hardly visible, while the bullseye was more indistinct than the black stumps which occasionally crop out of the snow on the hills near the targets. To add to the difficulty a fickle fish tail wind was blowing, requiring careful watching and constant changes of elevation and wind to keep anywhere near the centre. An hour was spent in preliminary pool if edice, we may be a fine of the match depended upon the last shot. Mr. L. Geiger got a bull on his final round, which gave him the lead by a point, and, notwithstanding the handicap of a point against him, he retired a winner. The details of the match were as follows:

Maynard Match-500yds., Off-hand.

*Handicap.

LITTLE FALLS, N. J., Feb. 23.—The following pigeon shooting match took place Feb. 22 among the old acquaintances of Little Falls, and a merry day was spent. Mr. H. B. Walker and Mr. John Hopping, of Hanover, were present, and scored well anong the shooters. We were all surprised to see Mr. Walker with his old broken gun. He used it all day; and when Mr. Baxter, of New York, who kept score for us, told him his gan was played out, he replied, "I will stand by Spier, Walker and Townley tied for first. To shoot it out, Walker started by killing his first bird, when they found they had fallen short of birds; so, the first prize being \$100, they were all willing to divide this among the three best. Walker's first bird naking four, he was entitled to \$50, and \$40 was divided among Messrs. Townley and Spier. The score was as follows:

Spier. The score was as tonows:	
	J Walker0 1 1-2
J Chapman 1 0 1—2	C Townley 1 1 1—3
	J Hopping 1 1 0-2
	T Foxall
Wm. Bunn	Peter Spier 1 1 1—3
	for \$40; 10 birds each, as follows:
Wm. Bunn, 0101101110-6; Peter Sp	ier, 0000010000—1.

ZETTLER RIFLE CLUB, Feb. 21.—Sixth competition for the gold match, 10 shots per man, gallery distance, possible 50: J. Levy, 60; W. Klein, 49; J. O'Nell. 49; M. B. Engel, 48; M. Dorler, 48; B. Zettler, 48; C. Judson, 47; G. Schurmann, 47; O. G. Zettler, 47; D. Miller, 46; J. Dutel, 46; N. D. Ward, 46; H. Hoiges, 45; A. Lober, 44; C. Recht, 41; D. Patterson, 41.—B. Z.

PLATTSBURGH, N. Y.—Match between Henry Collins, of Canada, and Henry Prentice, of Plattsburgh. Conditions: 20 birds, 30yds, 3ddrs. powder, 140z. No. 8 shot. Score:
Prentice...111111111111111—20 Collins....111110101101010111111115

THE FIRST GERMAN NEW YORKER GUN CLUB held their annual official election Wednesday, Feb. 8, in L. Maisch's hall, No. 384 Pearl street. The election resulted in favor of Henry Zahn, President; Fr. Schiller, Vloe-President; Fr. Pfaender, Secretary, and John G. Klein, Trensurer.

NEW DORP, S. I.—A match was shot Friday, February 24, 1882, between Fr. Oppermann and Adam Foetz, both of the First German New Yorker Gun Club, at 25vds, rise and 15 birds each, for \$50, at Col. Luxs' hotel, New Dorp, S. I. Mr. Oppermann Killed 12, and Mr. Goetz 11. The match resulted in the success of Oppermann. The shooting then ended in series of sweepstakes by those present. All present seemed to be well pleased with the few hours' sport.—Fa. P.

present seemed to be well pleased with the few hours' sport.—Fr. P.

THE TRAP IN SPRINGFIELD.—Springfield, Mass., Feb. 1882.—The
interest taken here in the trap, and in glass ball shooting, shows pleasant evidence in the preparations which the Rod and Gun Club Glass
Ball Association have made for the ensuing season. Near the close of
last year's field days, the need of a shooting house and somewhat
closer rules and perfected system, was manifest to all the fraternity.
A subscription paper was readily filled, and to-day the association
have a fine shooting house erected, 50x12, with a plazza eight feet
traps—pulling stand and lever—and the proper proposed and begarders
traps—pulling stand and lever—and the proposed proposed for the coming season, which will be opened the first Tuesday in March.
It is hoped that you may have to report, from time to time, interesting
and good scores.—

THE MATCH AT CREEDMOOR.

THE English rifle managers have completely turned the tables on the members of our American Board of Directors, and in place of capitulating under the absurd demand made by the acceptors for a guarantee of a return match in 1883, the British Council has shifted the scene of the proposed match from Wimbledon to Creedmoor for the present, and made the demand of the American managers that a team be sent over to England in 1883. The Americans at once accepted this turn in the programme; gave the promise that there should be a return match in 1883; and now all is bustle and preparation for the event.

It was a politic move on the part of the British managers They avoid the conflict and rupture which seemed sure to come so long as the return match guarantee was insisted

The throwing of the match over into September or later will enable the English riflemen to get in all the seapractice, to have the advantage of the selection which the Wimbledon gathering will present, and then striking the American shores when the worst of the hot weather will probably be over, the visitors will find those long days of steady weather so favorable to the making of the highest scores. The visiting team will go back, too, with many lessons gained in the matter of arms and team drill by careful observation on our American ranges; and so a victory for the British team during this year means an almost certain victory for it in 1883, while a defeat for that team at Creedmoor would leave the chances open and about even, with a fair margin of probable success on the side of the British

With the complete acceptance by the British managers of every change suggested by the Americans there ought to be an obligation on this side to make the match the greatest sort of a success. It will be a very easy matter to follow up an American victory in 1882 by the sending of a team across in 1883, and a defeat of the home team in 1882 ought to serve as a spur of the most pressing sort to secure a worthy representation abroad in the year following. We are, at any rate, certain of two matches in the two years, and from present appearances it will require some very lively work on the part of our American influence to make even a presentable showing in the opening contest. We are in this style of shooting, at the ranges named for the second stop, without rifles or

We have to make the one and secure the other, and that too with the utmost promptitude. But what has been once performed may be done again and with certainty, before us an American victory at the first encounter is entirely possible.

That the English shooters feel pretty secure in their own powers is shown by their desire for a match, even by sending over a team to fight it, and judging by all the data in their possession the English marksmen are justified in their confidence. They are the Goliah while we are but the little David. The dwarf may slay the giant but the chances are always in favor of the giant.

The turn which affairs have taken may be regarded as a very favorable one, and does credit to the diplomacy of the British Rifle Council. The step which they so gracefully took was at once a victory and a concession. They agree to the American demand for a return match without really offering to do so, and by the transposition of dates retain the part of leader and at the same time secure all the advantage to which their magnanimous action entitles them.

A defeat in 1882 will be very disastrous to our American association, far more so than a whipping on the other side would have been at the same date. The first match must be won, or at least not lost on anything short of an accident, or we fear that the chances of seeing an American team at Wimbledon in 1883 will be very slim.

The reception given to the visitors should be of the warmest sort. To have a set of British soldiers and members of Her Majesty's army, for such they will be, landing on our shores is an event of moment in itself. Such official visits abroad are rarely paid by the British soldier, even of the volunteer wing of the army, and we have a sufficiently large force of militiamen here to give their fellows at soldiering from Great Britain the heartiest of receptions.

THE APPROACHING SHAD.

N 0 doubt the extremely mild weather will cause the shad to appear somewhat earlier in northern rivers than usual. The 17th of March, the glorious anniversary of the ever glorious St. Patrick, who put a fast upon the meat but none upon the whisky, is the day set apart for the first shad to be caught in the Hudson. 'No right-thinking and respectable shad would like to be taken before that day, which is recog-nized by the "North River" family of shads as the opening of the season, yet occasionally an unprincipled member allows itself to be captured several days in advance of this date, merely to get its name in the newspapers. Such a one was taken up the Hudson River about the first of the month, and we were sorry to see that Mr. Blackford encouraged such a forestalling of the day, by giving it a prominent place upon the stand, and a placard calling attention to it. Such conduct upon the part of an adventurous shad should not be encouraged.

The staid and respectable shads are in no hurry to crowd in on the first day, even though it be the day set apart for remembering the virtues of St. Patrick; they hold aloof until the restless spirits of the more adventurous ones have led them through the Narrows and past Castle Garden. They wait with dignity outside of Sandy Hook until the snow water has all come down, gathering, in the meantime, flesh of the most savory quality, in order to retain their flavor up to the standard established by their ancestors, to whom was given the specific cognomen of sapidissima. These have no wish to be confounded with the Southern fish, which have been forty-eight hours out of water by the time they reach New York, and they so proceed leasurely and in order, knowing that epicures await them who will appreciate their freshness

A distinct species of shad is found in the Delaware River below Philadelphia. It is known as the "planked shad," and is always found on a chestnut plank before the fire. habits are little understood but it is conjectured that they scent the odor of previous shads exhaled from the planks which are never new, and ascend the banks of the river and fasten their tails to the same nails that held their ancestors. The planked shad loves the society of green peas, asparagus, hot rolls, and champagne. We think that the Fish Commissioners of New Jersey and Pennsylvania should pay more attention to this species. Commissioner Anderson, of the first named State, is well aware of their superiority, but we would call his attention to the fact that certain hotels are frequented by baked shad who try to pass themselves off on unsuspecting visitors as the genuine planked variety. This is resented by the simon-pure planked shad, who have cautioned their customers to suspect all shad not brought to the table on the plank. All planked shad hold a platter in abhorrence, and would not allow themselves to be served at a

hotel where the landlord took a shad to table in this manner. None genuine unless served on the plank, is their motto.

The shad of the Connecticut River keep later dates than those of the Hudson, and claim to be entirely distinct in their tastes and habits. These shad have learned to take flies in fresh water, by way of desert to their last pate de entomostraca, and the more esthetic among them have become so highly cultivated as to relish the artificial fly with a hook in it-to add piquancy to the otherwise flavorless compound of feather, silk and tinsel. After taking this style of fly the stimulating effect of the hook is seen at once. dance about like a man with an overdose of horse-radish, and rush ground in a wild state of excitement for a few minutes, and then become quiet, if they succeed in getting into a boat or on the shore. After the intoxicating excitement caused by the stimulating hook comes a reaction, followed by a repose which is usually fatal, but the shad do not seem to

If Dr. Watts were now living and fully acquainted with the different shads we have mentioned, he might, if so inclined, sing:

How doth the little busy shad Grow till he's a whacker, A feeding round Long Island Sound, Upon En-tom-o-strac-a

Let sharks delight to snap and bite, And chew up the sailors' clothes, But I am glad when a hot broiled shad Lies steaming under my nose.

LOADING FOR GAME.

T is impracticable to lay down a formula for the loading IT is impracticable to lay down a formula for the following of guns which will apply with equal good results in a cases. Two guns may be of the same make, and exactly similar in gauge, method of boring, weight, etc., and yet what is the correct load for one may not be for the other. The sportsman, then, who wishes to get the best work out of his gun should experiment with it to determine the load best adapted to securing the most effective work. The following hints for amateurs we published two years ago, and venture to repeat them now, in answer to numerous inquiries which have come to us.

In the first place, select the kind of powder that you think will suit you, and stick to it. We have several well-known makers that manufacture a first-class article, either brand of which will give satisfaction after you become accustomed to it. Bogardus himself could not successfully use a mixed lot of cartridges, especially at cross-shots. The reason of this is that one kind will burn slow and another quick, and an aim that would prove deadly with one kind would be very unreliable with the other. Therefore choose a good, clean, strong, rather coarse-grained powder, and when you have made your choice use no other. It does not make so much difference with shot, as nearly all the makers turn out a good The greatest trouble with new beginners is they are apt to use too many shot for their powder, thereby losing penetration. Always bear in mind that one pellet that crashes clean through the bird will bring him to bag much quicker than half a dozen that wind up in the feathers or penetrate but slightly. Our gun is a 7-lb., 12-gauge, cylinder bore, and after a very exhaustive test we decided that three drachms of Hazard's No. 3 duck, with two pink-edge wads, and seven-eighths of an ounce of No. 8 shot, with thin wad, was the most killing charge for all distances, for common field shooting. For thick cover shooting, when snap shots are the rule, we use the same charge for the left-hand barrel, but for the right, which we always use first for a quick shot, we use the same amount of powder and only fiveeighths of an ounce of No. 10 shot, thus obtaining high velocity, which insures penetration. We also get a large area of spread within a short distance, which secures many a bird that we knew we should not bag with ordinary charges, and we consider that our success in snap-shooting is in a great measure owing to the use of this deadly charge. Some may think that No. 10's Bre too light. We have not found them so, and nearly all our shooting is at ruffed grouse in the months of November and December, and we have never killed so clean nor so large a proportion of our shots as since we commenced using this charge.

We have already said that there is a great difference in the shooting of different guns, and the charge that will give good results with one gun will be far from satisfactory with others. Therefore test your gun thoroughly with different charges. Commence with 2½drs. of powder and ¾oz. of shot, and 2¼drs. of powder and ¾oz. of shot, and 3drs. of powder and 1oz. of shot; vary these charges until you obtain results that are satisfactory; try not less than ten of each kind, and carefully note the result. Always use a fixed rest when firing at

the target, as off-hand shooting is very uncertain. When you have found the charge that will give the best average resuits, be slow to change, and never do so until you find, after thorough test, that you have something better. Do not base your judgment upon your success or failure in bringing the game to bag, as this is most unreliable unless you are an experienced shot. Comparatively few can ever make first-class shots at all kinds of game. Very many, by painstaing, care and perseverance and a careful attention to neces sary details, can achieve a very satisfactory success.

THE TROUBLE IN OHIO.

A BILL is now before the Ohio Legislature to provide a three years' close season for game. Such a proposed law has absolutely nothing to commend it. But its passage is strenuously advocated by the representatives of the farming interests. The farmers of Ohio reason that they cannot afford to have their property despoiled and their live stock maimed by the shotgun ruffians who invade their premises. In that they are perfectly right, and should have the sympathy and support of all decent people.

But the Ohio farmers have set to work in the wrong way to secure a remedy for this evil. In their determination to rid themselves of the plague of trespassing rowdies, they have become aggressive and seek to trample on the rights of a very important and very respectable portion of the community. They propose in fact to punish the inno cent with the class the law abiding sportsman with the rowdy. They forget that when they make such a law as that now under consideration they are taking away from a very large number of hard-working business and professional men their favorite means of recreation, rest and recuperation. These men surely have rights which should not be wrested from them simply because land-owners have suffered from the outrages of another class of men. There is nothing in common between the ruffian gunner, be he rich or poor, and the gentleman sportsman, be he poor or rich. And we can conceive of no logical process of reasoning whereby the latter class should be made to suffer for the sins of the former, The law providing a close season of three years in Ohio would be a most unjust law if only because that it is based on a most unjust principle. But Ohio farmers are not the only men who have failed to see the social distinction which surely exists here, and until that distinction is insisted upon by sportsmen themselves, others will not recognize it.

Let the Ohio Legislature provide the strictest laws and the severest penalties to suppress shotgun lawlessness, but we trust that for the sake of the best classes of citizens of that State such unjust laws as that now under discussion may not have place on the statute book

Farmers have rights; we hope to see them maintained. Those who seek recreation with dog and gun have rights too, which should be insisted upon.

Its injustice is not the only objection to the proposed Ohio law. Such a statute would be futile as well. The fellows by whose depredations the farmers suffer are not a law-abiding class. They would not respect a three years' game law. The farmers would have the same trouble year in and year out as that they have now; and always will have until they adopt some more sensible means of abating the nuisance than by tinkering at the "game law." The only men who would respect the three years' law, would be the legitimate sportsmen, a class from whom landowners suffer no injury now, and by thus depriving them of their rights no advantage would be gained.

SCIENCE AND FISHCULTURE.

THAT embryological science and fishculture should go hand in hand is a fact disputed by none, except a few dog-in-the-manger fogics who, having little knowledge of what embryology really is, sneer at it. The United States Fish Commission has long been conducted on the plan of scientific fishculture, and Major Ferguson, the Maryland Commissioner, has made his name famous by his excellent reports wherein embryology has been a leading feature under the ablest scientists whom he could employ.

Mr. E. G. Blackford, the most progressive Fish Commissioner that the State of New York has ever had, has just taken a step in that direction. He has long been a valuable assistant to ichthyologists by forwarding specimens of fish, which came to him in his private business, at his own personal expense, to Washington, for identification, and has added many species to our fauna. Now he proposes to go deeper into the subject and has rented a room in the new Fulton Market for the purpose of advancing research in all departments relating to fish. The room will be fitted up for the gratuitous use of such students as may wish to avail themselves of its privileges to study up any special line of original investigation. This, no doubt, many will be glad to avail themselves of, and it will prove of great benefit to a class of students who now have difficulty in obtaining fresh material or a room in which to work it up.

New York city offers many facilities in the way of material for biological research, especially in the line of marine fauna, and the generosity of Mr. Blackford in furnishing such a place for its study will, we predict, not be neglected. Those who have pursued such studies at home, especially in the summer season, need not be told of the advantages of a public room fitted for this purpose. By this act Mr. Blackford will place biological science under further obligations to him.

WHAT ELSE COULD BE EXPECTED?—The latest prominent shooting case is that of a young New York lawyer, who died last week from the effects of a pistol shot, the weapon being discharged by his wife. If the published details of the affair are correct, the circumstances were most extra-It appears that the man had been accustomed to ordinary. keep a loaded and cocked pistol lying on the table in his room. It was a revolver of the old style, with straight trigger and no trigger-guard. There it lay day and night, ever ready for its deadly work whenever the inevitable accident should explode it. Finally, one Sunday morning, the tragedy was enacted, the pistol was discharged by the wife, and the man was killed. Nothing else, indeed, could have been expected from the circumstances,

We understand that Mosquito Lagoon, twelve miles from New Smyrna, Florida, is to be made more attractive to sportsmen visiting Florida by the erection of a small, but first-class, hotel there. The shooting at Mosquito Lagoon is excellent, and the deer hunting very good indeed, while there is no better fishing, we are told, in Florida. A party there recently, within one week, took, besides many smaller fish, seven "channel bass" weighing from twenty-five to fortyeight pounds. Next winter visitors will find a good hotel at the Lagoon, and we have no doubt that it will become a favorite resort.

California Quail on Long Island .- In the year 1852 Mr. Wm. Niall, of Islip, Long Island, brought from California thirty quail, which he turned out at Islip. Can any of our readers give us any further information about the

EASY READING LESSONS-V.

FOR THE LITTLE READERS OF THE FOREST AND STREAM.

T is a Dark Night, and the Young Man from the East is down in the Big Swamp. He is there to catch Snipe. He holds a Light and a Sack! The Snipe will fly at the Light as we all know Birds will do—and will fly into the Sack! Snipe have not come yet, but all the Mosquitoes in the Country have arrived. The Young Man is full of Faith, and his Boots are full of Water. His Kind Western Friends, who taught him this Nice, Easy Way to catch Snipe, are up at the Camp. I suppose some one is telling a Funny Story, for they are all Laughing very much.

MORE EXPERIMENTS WITH THE QUAIL.

IN reply to your request contained in issue of Feb. 23, for information as to the success attending the efforts of clubs or individuals attempting to introduce Southern qualis, we score a complete failure. Several of the sportsmen here raised sufficient funds to procure from Messrs, Ryall and Ledbetter, of Shelbyville, Tenn, about twenty dozen—231 birds—which arrived in several lots in December and January last most of them in an apprently nearly family decomposity. birds—which arrived in several lots in December and January last, most of them in an apparently nearly famished condition. Upon being fed they at heartily but soon commenced to die, and in a few days not one of the lot was living. We were shown the body of one, skinned by a taxidermist, that was not more than one-half its natural size, the crop was full of food but none in the intestines, and we believe that the birds had not strength enough left upon their arrival after the long journey without food and water, to enable them to digest their food. At any rate-we attribute our loss to this cause, and if in error shall be pleased to have the true cause explained.

In the spring of 1880 we received three hundred Messina

In the spring of 1880 we received three hundred Messina In the spring of 1880 we received three hundred Messina quail in excellent condition. They were liberated on farms near the city and were heard of frequently during the summer following, but no young broods were observed. There, however, is no doubt that they did breed, as the writer has in his possession a nest containing four eggs that was run over by a mowing machine and deserted by the old birds, which shows that if unmolested they would attempt to rear young. In the fall they all disappeared and none have been heard of in this section since, with one exception. In May last a gentleman who helped put them out was informed that some of the birds had returned, and upon visiting the locality with his setter succeeded in finding a pair and approached them twice near enough to identify them positively. They were left un-

setter succeeded in finding a pair and approached them twice near enough to identify them positively. They were left undisturbed but were not afterward heard of; others may have returned in localities of which we have no 'knowledge, as no special effort was made to keep informed.

This section is not a "sportsman's paradise." ruffed grouse are not as plenty as in many other sections of New England; there is usually fair woodcock shooting in the season, but no quails, snipe or ducks. Foxes are very plenty, to our knowledge no less than sixty-five have been captured by local hunters this winter in immediate vicinity of the city; of this number Ira A. Moore, of the Waverly House, has taken twenty-two.

MANGHESTER, N. H., March 3, 1882.

Manchester, N. H., March 3, 1882.

The first week in December last I ordered from Shelbyville, Tenn., one dozen live quail, which reached here the 11th of December in most excellent condition. They had been boxed with care and looked very healthy and bright, not at all worried by their long journey by rail. The last week in January I ordered another dozen, which came Feb. 2. They did not seem to be healthy, but I could not detect anything in particular. I turned them into my large cage, 8 by 18, with the first flock. On the afternoon of that day two of them died, the next day one, and day by day one or two were taken out dead, until by the 22d of this month the whole flock of twenty-four quail were dead. The last lot seemed to bring with them some dire disease that infected my first flock, which, up this time, had been so healthy, and in about twenty days I lost all the little beauties. I could not detect any indication of disease, such as lice or cholera. The trouble very evidently originated with my last lot, but what it was is past my finding out. I have heretofore been very successful with my pets and would very much like to know what caused this fatality.

THE OLD RED FOX OF BALD MOUN-TAIN.

THE HERO OF A HUNDRED RUNS.

MANY winters have passed since I first saw him—the Old advisedly, and in the same sense that we speak of a lovely maiden's summers—for is not winter the joyful season when, with eager hound, we enjoy the right royal sport of the glorious chase? What more appropriate, lines, for an old glorious chase? What more appropriate, lines, for an old glorious chase? What more appropriate, lines, for an old glorious chase? What more appropriate, lines, for an old glorious chase? What more appropriate, lines, for an old glorious chase? What more appropriate, lines, for an old glorious chase? What more appropriate, lines, for an old line property of the cheerful season; and repeat, many winters have passed away since if first saw him in all the pride and pomp of his first chase. Not so many by eleven love the change of the change

fox appear upon the scene. I knew him at once as the one that I had seen an hour before ahead of the dogs. His tongue was out and his brush was trailing, he evidentily was having a hard time of it. Take courage, old fellow, for deliverance is near. Here comes our friend of the beautiful coat gaily cantering to the rescue. See the tired one as he toils up the steep, glame back, and understanding the ruse, slackens his headlong speed, and as the dogs break into the open with eager cry, he squats upon his haunches and calmly watches his deliverer, who unconcernedly continues his gambols until the open-mouthed dogs are almost upon him, wherk knowing by their frantic screams that they have caught sight of him, and his friend is safe, he gives a final shake and with a default fourish of his tail almost in their faces, glides away with a long, low sweeping stride that soon leaves his pursuers far behind. "Noble deed, bravely done," and deserving success. But hark there comes old Sounder with his resonant one-one at every stride. Gallant fellow, his many years are too much of a handleap when the scent lies as now; but he steadily keeps on the even tenor of his course, well knowing that, when the sun gets a little higher and the track grows slim, he will find his companions circling some barren field or whimpering in some old road, and again take the lead. Now he is in the open, and as he canters up the shope he causes a new light to dance in the eyes of Uncle Nat, for he does not turn after the others, but with head high in air, exultingly voicing his delight, and with quickened speed he keeps straight on up the hill "true to his first love," who has jumped to his feet and is coming toward us, Uncle Nat slowly brings "old Hollyhock" to a present. I hear the onimous click of the old flint-lock, and as the fox is creeping in front full sixty yards away the old gun belches forth a cloud of fire and smoke, and reynard rolls in the dust. My long pent up feelings found vent in a series of yells as I rushed, had a submediate

present I had drawn upon my imagination for some of my facts, thus, I had entirely ignored Unice Nat and "old Holly hock" and held him until old Sounder came up.

Let us now return to the chase of our gallant fleet-footed hero. We left him showing the pack a clean pair of heels. In fifteen minutes the pack was out of hearing, and we neither saw nor heard them more that day. About midnight two of the dogs got home; three more straggled in the next afternoon footsore and weary; more than a week after, one was found twenty miles from home; the other we never heard from. Although some of us were out nearly every day, we did not start this fox again until the middle of March. I well remember the date, for when he first showed himself, fifty rods away, I exclaimed, "There is our hero of opening day." Several of us were standing together, and Joe Hicks, who was quite a poetical genius, shook his fist at the fast rereating form and quoted in a sepulchral voice, "Beware the ides of March." Joe must have been endowed with the spirit of prophecy, for on this fateful day eleven years later, this hero of a lundred contests was brought to grief. As soon as the fox was out of sight, every one started for his favorite runway. I was not old enough to carry a gun, but hunted because I dearly loved the sport. As I had learned the different runways and was sleet of foot, I managed, by cuting corners, to keep pretty close to the dogs most of the time, and unless the chase led straight away, I seldom lost a single note of the music, and frequently saw the foxes and witnessed many of their sly maneuvers. So when the others left me, I ran to where I had last seen the fox, and sitting down, waited for the dogs, who were fast approaching. Looking in the direction that our hero had gone, I saw him returning. There was an inch or two of fresh snow, and he was carefully stepping in the tracks he had made when going. I kept quiet and he came within two rods of me, when he gathered himself together and with a prodiguous leap side ways, clear

day, I did not follow, Uniking that he would adopt the same tactics and that we should see no more of him or the dogs for that day.

Sitting down upon a stone, I listened to the dogs, meanwhile bewailing our unfortunate luck in starting this fox on such a magnificent day. I had been there but a short time when I heard a dog in the distance behind ne (I learned afterward that he was let go on the trail nearly five miles away). Turning to look in his direction, great was my surprise and elight to see our beautiful hero, who had disappeared in the opposite direction a short half hour before, break into the open and come straight for me. He cantered up within twenty feet of where I was sitting, and came to a stop and turned his bright eyes up to my face with an inquisitive look. He had undoubtedly been unable to quite make me out in the horry and scramble attending my first appearance, and after obtaining a sufficient start from the dogs had returned o investigate the phenomenon. While musing thus, and admiring the unstudied gracefulness of his every motion and the beautiful contour of his supple form, my thoughts were

turned into another channel by the nervous twitching and retraction of his lips. I could see the sharp white teeth gleaming in his partly open mouth, and as at this moment a twinge of pain shot through my wounded hand, I was forcibly reminded of my struggle upon "opening day," and it is needless to say that I did not covet a combat with this uneasy looking brute, who had moved a step nearer, and with his ears laid back and an occasional jerky flourish of his tail, appeared about to spring upon me and punish me for my interference with the success of his well-laid plan to outwit the dogs. Or, stay—perhaps he has heard the oft-told tale of my first brush, and recognizing me. has come to wreak a summary vengeance upon the fell destroyer of his dearly-loved friend. But a few seconds had passed since his appearance, yet it seemed a long time to me, and as this last thought flashed through my mind, an oppressive feeling of dread came over me. I could stand it no longer. I made up my mind that there had got to be a fight; and knowing well from experience in many a battle with my schoolmates that a vigorous onslaught would often reverse the odds. and reassured by a cheery shout from some one on the hill above me, I threw myself at the grinning fiend with all my force. He did not run, but, like something supernatural, appeared to glide away just out of my reach.

At this juncture the dog that I had heard a few moments before, gave tongue a short distance below me, I recognized his voice, and with a loud spasmodic yell sounded my war cry. He knew the signal, and before the sound had died upon my lips he was coming at full speed, his despairing mournful wail at the coldness of the track suddenly changed to eager, joyous notes, for well he knew that this cry would surely lead hin to a fresh trail steaming with the grateful perfune he loved so well; or, oh happy thought, perchance his longing eyes would actually behold the object of his longing desire. On, still faster he came, with flakes of foam flying from his wide open

his tail still curled close between his legs and one ar turned wrong side out, the very picture of alject fright. The fox had sheered to the right and was leisurely cantering up the hill, his shining coat was all smoothed out and as he looked round at me and then at the cowering dog, I imagined that I could plamly see a broad grin upon his face and his sides shaking with laughter, ever and anon he would flourish that beautiful brush in a manner that was péculiarly aggravating to my deeply wounded feelings. The other dogs now came up. Straightening them on the fresh trail, away they went, and I do not remember a better race than we had that day. Round and round the mountain, with an occasional turn away, but never out of hearing, this wily fox kept us in an agony of suspense all day long. Very often in sight, but never within reach of the "death-dealing tube." he appeared to delight in tantalizing his would-be captors. No sooner would one of them leave his stand to go to a better one, than this cunning rascal would slowly saunter by within a few yards of where he had been patiently waiting for hours. His crowning act of impudence was played upon Uncle Nat, who had remained crouched behind a big rock that was a famous runway from early morning until nearly night. About fifty rods below him was a barway through which the fox had passed several times. Once seeing him come into the open and head toward this barway, Uncle Nat forgot his own golden rule, to "stick to your station when the fox is playing," and cautiously crept down the wall within shot of the runway. After waiting some time for his expected victim, he slyly peered over the wall, but not seeing him, involuntarily glanced behind him. "Pity the sorrows of a poor old man!" There, standing upon the rock that he had just left, the setting sun illuminated each particular hair and causing it to gleam like burnished gold, he beheld this incarnate trickster calmly looking at him, and evidently enjoying his discomfiture. I was but a short distance away and witnes

PEEKSKILL, N. Y. Jan. 30.—In this region last fall woodcock shooting was moderate, quail very scarce, almost diminished from the fields where they we found but a few years ago in good quantities. Their early departure is a mystery yet to be solved. Ruffed grouse are found in but small numbers. Gray squirrels abound in the woods. I shot twelve from one tree. The prospects for sport in the coming full are good,—D, A, P.

"PODGERS" TRIES FLORIDA.

"PODGERS" TRIES FLORIDA.

TROM this paradise of the sportsman, made famous by the Forest and Streem, I greet you. To those who have read your work on Florida this place must be somewhat familiar, but feeling that a more recent "report" on its attractions will be acceptable to your numerous readers, I sit me down this bulmy afternoon after a dinner fit for the gods (presuming that the gods were sensible enough to appreciate such a one) with a soothing pipe to tell you what a jolly good time I am having.

It was sharp and cold when the good stamer State of Texas left Pier 20, East River, and headed down the bay bound for Fernandina, and a stiff northwester was singing through the rigging; but much to the gratification of many of the passengers who had sundry misgivings as to the retention of their dinners, it was smooth along the Jersey shore, and the gathering under the lee of the smoke stack was in full force. Steadily and rapidly she steamed on her way to the orange groves, and when the steward's summons to the matutinal meal rang out over the cold waters the response set at rest all hopes of the cook that his duties would be for a month to the tempting "lay out" of the Sturtevant, but on this occasion there was no such failure, and during the three following days there was little profit to the steward's department.

Railroads are all very well when one cannot take steamer,

but on this occasion there was no such failure, and during the stree following days there was little profit to the steward's department.

Railroads are all very well when one cannot take steamer, but the dedicious sense of rest and peace that one feels with plenty of room to walk deeks, and when tired of that, a chearful warm cabin and a clean berth to turn into with a certainty of not having your neck dislocated by sudden stopand starts, and your rest disturbed by shrieking engines, is a consummation not to be realized on a train of dusty cars, to say nothing of sitting down to a square meal with plenty of time to enjoy it, and no dyspepsia from hasty feeds of greasy compounds and gutta percha pastry, and lastly and not leastly at one-half the expense.

You can take one of the fine steamers of the Mallory line, and with all the comfort described, find yourself landed in Florida and travel about for ten days for what it would cost to take rail, the charge by steamer being but \$23, while by rail the fare is \$35, sleeper \$5, meals en route (and such meals) as much more, or say about \$50 total. There is no comparison on the score of expense or comfort in the choice, and any one having any regard for either will take steamer

and any one having any regard for either will take steamer

rot take rail, the cather being but \$23, while by rail the tare is \$35, sleeper \$5, meals en route (and such meals) as much more, or say about \$50 total. There is no comparison on the score of expense or comfort in the choice, and any one having any regard for either will take steamer every time.

Arriving at Jacksonville one finds a busy, prosperous place, with hotels full of Northern tourists, cripples and invalids, familiar New York faces in the streets, and the fashionable Fifth Avenue belies with the usual pug or Yorkshire pet dog, the latter warmly welcomed by the jocund flea. You are met on every corner by the runners from opposition is teamboats, and are enlightened on the merits and demerits of the numerous boats. Fare by virtue of the strong opposition being cheap, and a little more so than remaining at the hotels, which are generally high priced, although if one knows the ropes good accommodation can be found at less pretentions houses at less rates. I tried the Tremont and found the table unexceptionable and price reasonable—\$3 per day for transient, less for permanent. But as sight-seeing was not my racket and little alligators in the windows had no charms for me, I pushed on to Cedar Keys, for there is no sport to be had at Jackson-ville. The fishing is poor, and as for shooting, the birds are as scarce as in New York. Occasionally one comes on a king-fisher, which immediately exclaims mentally. 'Good gracious here's a tourist. I'll git.' And "git" he does at a lively gait, knowing full well it will be bang, bang at a hundred yards. As for alligator shooting, that is a thing of the previous. The gentle saurian knows his value, and that his carricus will bring ten dollars, his teeth he made into dog whistles and scarf pins, and big lies told of his idmensions. The alligators have got to know just the hours the boats will pass, and when one of them looks at his watch and sees that time is about up, he rolls off his log, sinks behind it, and with one cye just his provided to the provided particus and

at the eastward I roused Dick and asked if that did not portend something we were not hankering after. Dick allowed that it looked so, and in order to get a "lee" we hauled up for the coast, miles and miles to windward and not in sight. For half an hour we carried all sail; then had to put in a reef, then another, and then another, and still it "piped." It did blow; and the sea began to rise, and the Spray to labor, and the darkness of Erebus followed. Still we carried on, and as the phosphorescent seas broke on our bow, the conviction loomed up in my mind that it would have been wiser to have waited for the larger boat. But the recollection that the day before leaving I got insured in the Accidental Hartford Company was soothing consolation; firstly, because nothing serious could happen; for had I not been for years trying to get the best of life insurance companies vainly? Secondly, had it not been oft and repeatedly promised me by a pious old aunt that I never would be drowned, but was reserved for a higher at the eastward I roused. Dick and asked if that did not por-

that I never would be drowned, but was reserved for a magner destiny?

By this time it fairly hissed, and the swash of water in the boat told the tale of boarding seas that, if continued, were bound to swamp us. Diek bailed with the wash basin and I cased her at the helm; but it was useless, and Dick and I held a council of war. One of three things must be done, either to throw the freight overboard, up helm and seud, or anchor—for be it known that soundings showed but four fathoms, even though we were a good ten miles from land—a rare dispensation of Providence, especially designed for such occasions. There were objections to either propositions; firstly, it was dangerous to get a barrel upon the gunwale to launch, as the weight would heel her and let the seas in on us. To scud was to run the risk of a pooping sea, loaded as we were, besides a prospective voyage over to the coast of Mexico with short rations. So the anchor was the best experiment. We got the small piece of sail down and the anchor over with long scope; and, Jerusalem! how she pitched and rolled. But coral rock bottom was good holding ground, and she held. But the forward deck rode under, and the seas would soon have settled our hash except for the house which broke them. After watching her awhile I made up my mind she would stand it, if it got no worse. Fortunately it did not. Crawling under the cuddy, somewhat sheltered from the spray, I waited for morning, and filled in the time by builing, while Capt. Dick coiled himself up on the case of bacon and went to sleep; and high above the whistling of the wind through the rigging and the pounding of the seas that nigger's snore arose. It was a square stand-up tussle, but Dick won; and about daylight the wind gave up the fight. The sun rose bright. The sean calmed down. A light breeze came out from the south, and we got under weigh. By noon we entered the mouth of the Homosussa, and, with a hedd wind but fair tide, we beat up the four miles; and, rounding a bend, the welcome sight of the Jones wide By this time it fairly hissed, and the swash of water in the

On the Homosassa, Florida, February, 1882

REMINISCENCES OF A SPORTSMAN.

REMINISCENCES OF A SPORTSMAN.

A BOUT the year 1872 I was invited by my friend, Col. J. D. T., than whom few worthier men live, who was then a rice planter in the county of Brunswick in this State, to visit his hospitable home and join him and several others in the pleasures of the chase. At that time, and even now, so far as I know, deer abounded in the pine lands and swamps of that section, and to get an abundant supply of venison only required a few good dogs and skillful hunters to bring down the game which the might start from their lairs. Still hunting or stalking, as some persons call it, was not practiced, for the reason that but little success attended it. Hounds—whether of "Black St. Hubert's breed," I do not know—were almost invariably used; and the experience of this section demonstrates that deer were not exterminated at all, nor permanently driven from their accustomed haunts by the chase, the opinions of learned writers "to the contrary not withstanding." Pleet dogs of good breath can force them not only to "pant for the water brooks," but to plunge in them as a means of refuge, but they will surely return before many days have clapsed. In open woods, where deer are plenty, still hunting is far more destructive; for there the huntsman has only to have the advantage of the wind, and knowledge of the habits of the animal, to enable him to kill noneally every one he sees. An acquaintance of the writer told him, several veurs age, that near the banks of the Suwannee hunisman has only to have the advantage of the wind, and a knowledge of the habits of the animal, to enable him to kill nearly every one he sees. An acquaintance of the writer told him, several years ago, that near the banks of the Suwannee River, in Florida, he had killed 173 deer in two years, by stalking, with an old-fashioned muzzle-loading rifle. A party of us, including himself, hunted two days diligently in the same neighborhood with a pack of dogs, and though we started plenty of them, did not even get a chance to shoot. But this is a digression. On the occasion to which I refer, the party consisted of Capt. Rumming, Kinchen K., Nick Darcall, Col T., William Fires, Teecel, Rev. William Millets, the writer, and one or two others. The month was September, and the good old county lad done her best to give us a good supply of mosquitoes to keep us charming company while we were in the woods. Although there were hundreds of thousands—this is not strictly accurate, you know, for I confess I was kept so busy that I could not count the enemy—we were not troubled at night at all, and so far as their music was concerned, slept quietly and sweetly. Rice birds were plentiful in the plantations, and fat and juicy as few other birds ever become. Col. T. had secured several dozen for the purpose of regalling his guests; they were nicely prepared, set on the table for supper and eagerly devoured by all the company, especially by Kinchen K. and Capt. Rumming. That night—the memory of it haunts me still—the god of discord reigned triumphant, through the mouth of his vice-regent Rumming, assisted in no small degree by other Kako-phanists, who indulged in the usual stentorian variations, to the bullfrog tones of their leader.

Next morning, at an early lour, we were off for the hunting grounds, between Orton and Lilliput ponds. Soon after

plannists, who induged in the usual steniorian variations, to be fullfrog tones of their leader.

Next morning, at an early hour, we were off for the hunting grounds, between Orton and Lilliput ponds. Soon after reaching the point of our destination the forces were properly disposed, and it was not long before the report of Parson Milletts' gun was heard. Both barrels had been fired, and the writer, who had been assiduously fighting a whole brigade of mosquitoes about two hundred yards away, left his "stand" and went to see what had been done. Milletts had a fine buck. He told me he had shot about a hundred yards the first time, "and a leetle furder the next." Noticing that the deer had been hit with several shot, and thinking that a gun capable of such performance, at that distance, a remarkably good one, I ventured to ask if it could be relied upon for such work. He assured me that, if properly charged, it would do the same thing nine times out of ten. I then asked if he would sell it, and told him if it would do

as he represented, I would be glad to purchase. He told me he would take \$30 for it. I replied I would give him a hundred if, on trial at a target, I saw that it was such a shooter as he alleged. It was agreed that when the hunt ended I might make the trial. A day or so afterwards, for the wan of a better target, a flour barrel was placed on end, and Kinchen, an old surveyor, stepped off the required distance, and shot each barrel consecutively. When we went to the barrel we found it had been hit with only one shot, and that did not even stick in the stave. As Milletts had loaded it himself, it was clear that he overestimated the capacity of his gun, as he doubtless did the distance at which he shot the buck. And so I didn't buy that gun. The truth is, that very, very few shotguns can be relied upon beyond fifty yards, and most of the tales to the contrary are the purest fiction, and must be taken with very many grains of allowance. Indeed, after the finsco of Milletts' gun, all the crowd tried the barrel, and, except in one instance, no gun hit it with more than one shot.

Milletts killed another buck the same day, at what he said was eighty yards, but old Kinchen, who was near him, told me it did not exceed forty. Nevertheless, we got two deer, and then went to our buggies to take the noonday lunch. Our good hostess, with her excellent neighbor. Mrs. Fires, had prepared us an excellent repast, and, as usual, with appetites somewhat sharpened with a draught of Glenlivet, full justice was done to the sylvan entertainment. Milletts, with a little persuasion, concluded that as he was hunting, he would take a mere taste, and, holding the bottle to his mouth, I counted nine movements of the piston of his throat, and wondered if that was what he called a taste, what he would call a drink!

with a little persuasion, concluded that as he was hunting, he would take a mere taste, and, holding the bottle to his mouth, I counted nine movements of the piston of his throat, and wondered if that was what he called a taste, what he would call a drink!

On my return to the city of Washington, I stopped with a friend and presented him with a fine fresh venison ham for his Sunday dinner. Among his special guests, invited particularly that he might partake of the game, was an eccentric but intelligent clergyman whose name was Patterton. After we got to the table and Brother F, had returned thanks to the Giver of all good for His mercies and blessings, I ventured to ask him if he did not think that such a piece of venison, like Burns' haggis, was "weel wordy o' a grace as lang's my arm?" He replied, "No; short graces are always the best, for you can get to cating the quicker." It is certain that he enjoyed the roast "excellent well," judging from the rapidity with which his molary organs were moved during the continuance of the dinner.

The scene now changes to a point much nearer home, and involves some of the same parties who have figured in another part of those reminiscences.

During the month of November, 1873, we had a hunt about fifteen miles northeast of our town. One afternoon, the hunters divided, and concluded to drive the same swamp and the bordering thickets, so as to meet each other about half way. A gentleman, a close kinsman, and a dear friend of the writer, whom all his nephews and ninces and many others called "Uncle Pickett," old Kinchen K., Parson B., and Inveself went to the upper part of the "driveo" and started down. We had two hounds, Bob and Rock. Parson B. and I were on one side, while the two hounds were on the other. We had not gone exceeding three hundred yards, before the dogs "gave tongue," nearly opposite where I was waking. I hastened rapidly below, evincing unusual agility, and had run perhaps fifty yards, when I saw a large buck emerge from the swamp and head away, so as to gi

at uncommon range, he hears the words of Old Kinchen—
"tol'able thick, for forty yards."

On another occasion, quite late in the afternoon, and in the sume section of country, Teceel and Parson Duffrey—he of Lake Waccamaw—were sitting, facing each other, at the conclusion of an unsuccessful drive, when Brother D. suddenly raised his gun, pointing it diagonally towards his companion. "Fool who?" said Teceel. Just as he said it, bang went Brother D.'s gun, and as T. looked round, he saw a fine deer, about eighty yards off, bounding away as well as he could. Both shot, and then went down to see whether any damage had been done. As they were looking at the place where Brother D. said the deer was standing be remarked, "It, was a nice fawn, T." "Fawn, the —— (beg pardon Bro. D.) it was a fine buck." Just then the writer came up, and as he pursued the track, he soon saw where the buck had run against a small hickory tree. He remarked that he, the deer, was hit, or he would not have touched that tree. Pursuit was made and after going about a mile he was found. And Brother D. having "flashed his maiden sword," was happy. After getting to camp he talked and talked ahout the achievement until he wore us all out. Indeed, I fear that his exultation was so high, that he forgot one of the duties of all men—a nightly approach to "the throne of the Heavenly Grace."

In that day the region for miles cast and northeast of the

In that day the region for miles east and northeast of the spot where we camped afforded splendid sport to the deer-hunter. With good dogs they could be started in nearly all the "drives," but it very often happened that the game eluded the walchful standers by running out at some place where no one was located, and where nobody thought a deer ever would run. After fleeing for a while, often shifting their course if the dogs continued the pursuit, they took the nearest feasible route to some large body of water, where all trace of them was lost. Can this habit be what David had in his mind when he wrote the Forty-second Psalm—"As the hart panteth after the water brooks, so my soul panteth after Thee, Oh God." It is certain that the mere desire to quench a "raging thirst" cannot be the motive which impels the deer

when pursued by unrelenting dogs to seek the water. I have known them often to cross a mere brook twenty times in their course to the river, without ever stopping at all. They seek for safety, not for drink nor for cooling. It seems to me, therefore, that in the light of safety from all enemies, the simile in the verse I have quoted is far more expressive. And now, begging pardon of every one who has had the patience to follow me in this and other articles, for forcing him to the exercise of that very commendable virtue, I promise him at least a week's repose before the commission of another trespass.

another trespass. Wells.

PASSAIC FALLS.

PASSAIC FALLS.

ROM what knowledge 1 have of the country that stretches out toward all points of the compass from the watery boundary of New York city, I will venture the statement that there is not another spot within an hour's ride of your office that just now combines so many elements of grandeur and beauty in the way of natural scenery as do Passaic Falls, at Paterson, N. J. I will not even except the famous Palisades at their best. At present the scenery at the Falls is all Nature's own. It seems, as if out of pure jealousy, she would put out of sight the encroachments and embellishments of art, for the strong stone wall built across the top of the cataract last summer, during the drouth, is entirely hid by the great volume of water that now goes gliding over it, and plunging madly down into the deep rockwalled chasm. Likewise, the trussed foot bridge over the chasm, a little east of the Falls, is absolutely covered, inches thick, with frozen spray, a fantastic array of icicles of all sizes, some of them enormous, depending from the bridge's floor. Shelving rocks are fringed with them. Whatever the spray touches it adorns in beautiful ice drapery. The trees are cumbered with ice from trunk to remotest stem, and those in close proximity with the Falls are quite denuded of their limbs by the weight which proved too great for their strength.

Yesterday, while I was at the Falls, a limb four inches in

strength.

Yesterday, while I was at the Falls, a limb four inches in diameter where it joined the trunk of the tree came crashing down to the ice-paved earth. The ground beneath the trees is literally strewn with severed limbs. A boy handed me a little twig with three tiny prongs, on each of which a ball of ice had formed that together would weigh at last two pounds. He had plucked it from a small hemlock several rods away. The Falls are three hundred yards wide, while the chasm into which the great flood of water tumbles is at its widest point not more than twenty feet. From this narrow chasm the water runshes out at a right angle to the Falls into a large, deep basin, and thence again, a little north of east, forming an acute angle with the basin, it pursues its course down the rapids, which of thems-lives are really picturesque as viewed from the high, rocky promontory between the Falls and the rapids. Across these rapids, at a high elevation, rope-walkers have risked their necks for the amusement of the people, and for their amusement Sam Patch once leaped into the basin from a projecting cliff. It has appeared like a perpetual holiday at this interesting spot, so constantly do the crowds come and go, many in carriages, but more on foot, since the high water in the Passaic and the gorgeous appearance of the Falls in its beautiful winter robos, woven by icy fingers out of the delicate tissues of the rising, floating mist, all emblazoned by the inevitable rainbow that shoots up out of the sprayey chasm like a ribbon of fire.

SCREECH OWL IN CONFINEMENT.

WHILE out shooting in December last I had the good forage. After being shot the little fellow flew to the ground, and was secured under my hat; uncovering him, he appeared to be dying, and was therefore carefully wrapped in a piece of paper and deposited in a capacious pocket of my shooting coat. A tramp of three hours brought us to the wagon; and, taking Scops out, I put him in the basket, observing to my companion that he was about as dead as an owl could be. Much to my surprise and delight, upon arriving home and opening the basket, there sat the owl, out of the paper, with eyes wide open, snapping his bill and hissing at a most alarmate. We put him in a large cage, where he afforded us much pleasure by his curious habits. For the first few days he was very quiet, not moving about much, night or day, probably owing to having been wounded; nor would he eat anything, even though it were left in his cage all night. We were afraid he would "kick the bucket," so determined to feed him, which was accomplished, with some difficulty, in the following manner: One of us would hold him and pris mouth, while the other poked a chunk of raw meat down his throat; we found it necessary to thrustit behind the forked part of his tongue, otherwise he would throw it out of his mouth, which was accomplished, with some difficulty, in a first order, which is the some of the would remained to forked part of his tongue, otherwise he would throw it out of his mouth, which was a decompliand closing his mouth, just as a person would who had tasted something remarkably nice. After a week of feeding in the above manner, he seemed to grow much more lively, flying about the cage during the night, and feeding himself night or day with equal arvidity, either taking the meat in his bill or claws, as suited his convenience. WHILE out shooting in December last I had the good for

night, and feeding himself night or day with equal avidity, either taking the meat in his bill or claws, as suited his convenience.

When he had passed about ten days in confinement we became very much attached to him, passing many moments in his society, amused by the curious and comical motions he went through; also the varied forms of facial expression, caused by winking one eye at a time, or raising and lowering the long car tuffts. I cannot refrain from quoting what Wilson says about this species, as it conveys a new feature to this already comical and interesting bird: "On contemplating the grave and antiquated figure of this night wanderer, so destitute of anything like gracefulness of shape, I can scarcely refrain from smiling at the conceit of the Indicrous appearance this bird must have made had nature bestowed on it the powers of song and given it the faculty of warbling out sprightly airs while robed in such a somber exterior. But the great God of nature lath in His wisdom assigned to this class of birds a more unsocial and less noble, though, perhaps, not less useful disposition, by assimilating them, not only in form of connenance, but in voice, manners and appetite, to some particular beast of prey, seeluding from the enjoyment of the gay sunshine of day, and giving them little more than the few solitary hours of morning and evening twilight to procure their food and pursue their amours, while all the tuneful tribe, a few excepted, are wrapped in silence and repose. That their true character, however, should not be concealed from those weaker animals on whom they feed (for Heaven abhors deceit and hypocrisy), He has stamped

their countenance with strong traits of their murderer, the

their countenance with strong traits of their murderer, the cat; and birds in this respect are, perhaps, better physiognomists than man." The above opens, to me, at least, one new supposition: What if the owl could sing?

Upon our approaching the cage he would erect all his feathers, lower his ear tuits and head, swing his body from side to side, winking his large eyes, and repeatedly snap his bill together, producing a loud cracking noise, alternating the fits of snapping with a hissing noise, produced by expelling his breath suddenly. He also had a habit, which I do not find mentioned in the books, and which I have never observed in the great horned owl (Bubo viryinianus), of which species I have had two in confinement, and that is, when going through the above-mentioned defensive maneuvers, he would often stretch out one of his wings to its fullest extent backward and downward, as a bird does when stretching its wing. It is hard to imagine a much more grotesque object than our little friend when engaged in warning us away from his cage in the above-described manner. When sitting on the perch in his cage he always sat at one end, bringing his body against the side of the cage in the same way that he would sit in a tree, doubtless thinking he could be less easily discovered if close to one side. I often allowed him to fly about the room at night, and his flight was as soft and noisless as falling snow. Frequent handling caused him to become very tanked about the room. In a lighting, after a flight, he would, if his back was toward us, either turn around with a sudden jump or turn his head, which he could do to an alarming extent. After a time, owing, I suppose, to teasing, he got cross, and would fight a stick or your hand when thrust into the cage. In so doing he usually struck out with one foot, fastening his claws in the object, and, at the same time, delivering a vigorous bite, followed by a twist, calculated to tear off a piece of the tormentor. In the cage were two swinging perches, to which he took a gr

SPRING NOTES.

BAY RIDGE, L. I., Feb. 19, 1882.—While out gunning on Thursday (16th) I observed several bluebirds (Statia statis) and two flocks of cedar birds (Ampelis garratus) hovering around the top of a cedar tree. Among the branches of a weeping willow near by were congregated a small flock of tree sparrows (Spizella monticola); also two pair of ducks were seen winging their way to the far north. I was informed by a friend, whom I met later in the day, that he had seen a few meadow larks at a friend's place, where he had been visiting. Have also heard the song sparrow, but have not seen any yet.—A. L. Townsenn.

New LONDON Comp. Feb. 27, 1889.—I have recomptly

New London, Conn., Feb. 27, 1882.—I have recently observed here a number of birds that spend the summer with observed here a number of birds that spend the summer with us, as follows: Feb. 14th, robins; 15th, redwinged blackbirds; 25th, two red linnets, robins, redwinged blackbirds; 26th, robins and a whitethroated sparrow. Yellow birds, song sparrows, flickers, redheaded woodpeckers, bluebirds, larks, kingfishers, etc., have been seen around all winter. I shot a goshawk the other day that was cating a full grown white leghorn hen. Is not this hawk a rather rare bird in this section? Sharp-shinned, sparrow, cooper's hawks are more plentiful this winter than I ever knew of before.—B. C. S. [The goshawk is not especially rare in Connecticut. Years ago, when we were accustomed to collect birds in that State, we usually killed half a dozen of this species every year.]

New HAYEN, Feb. 27.—In going into the country to-day

we usually killed half a dozen of this species every year.]

New Haven, Feb. 27.—In going into the country to-day with another party we saw a large flock of redwinged blackbirds. Is this not an unusually early time for this species of bird to put in an appearance in this latitude? Redheaded woodpeckers have been here all winter. Robins and bluebirds have been here all winter. Robins and bluebirds have been here for several days past.—L. E. M. [We have found redwinged blackbirds in the vicinity of New Haven in every month of the year.]

Haven in every month of the year.]

Weellength, N. Y., March 2, 1882.—Robins and bluebirds appeared for the first time this spring last Saturday. Purple finches are quite plenty. A few flocks of pigeons have lately passed over on their way north.—E. W. B.

Elmira, N. Y., Feb. 21.—While driving in the country today I observed a flock of bluebirds ('sialia sialis'). The weather is cold and wintry; ground covered with snow and the mercury indicated but 12 degrees above zero this A. M.

This is the earliest arrival of bluebirds coming to my notice during five years of observation.—E. B. Gleason.

Watergrown, N. Y. March 2, 44 dec. lat.—The bluebird

during five years of observation.—E. B. GLEASON.

WATERTOWN, N. Y., March 2, 44 deg. lat.—The bluebird arrived in this section to-day, and is the only spring arrival proper, as yet. The waxwing and goldfinch evidently remain hereabouts when the winters are open. For several seasons the bluebird has arrived in advance of robins and sparrows, and is entitled to distinction as "the first bird of spring." Black River is nobly at its task, the bearing away of snow water from the North woods. The trouter can reasonably expect an early opportunity.—J. Quay.

Newport, R. I., March I.—Hundreds of brant were seen here Feb. 28 in the upper bay. Is not this early for

NewPort, R. I., March 1.—Hur here Feb. 28 in the upper bay. them?—X.

Shore Lark Breeding in New York.—We take the following note from Mr. Chas. A. Green's report of the committee on ornithology of the Western New York Hortcultural Society. He says: "H. T. Jones, of Rochester, N. Y., reports to me as follows: "With many others. I have been interested in watching the nesting habits of the shore lark, (Eramophila cornetta) a species which has only recently been known in our State. It is a native of the Rocky Mountain section. I found the first nest and eggs recorded in this State in 1876. The nest was small, composed of grasses and dried sticks (small ones) placed in a hollow in the ground in the nursery row. There were four eggs, differing but slightly from those received from Utah. The shore lark has become more common, but I have been unsuccessful in securing another nest until the past summer, when, in hoeing between small peach seedlings in June, I found a second nest, containing four eggs. Not being positive, I watched the female go on the nest, thus establishing the identity beyond doubt. The nest was placed on the ground in a clump of weeds, and partly shaded by the peach seedlings. Both of these nests were found upon land frequently cultivated, within gunshot of a dwelling, showing that this bird has confidence in human kindness. Like the night hawk, nursery fields seem to be its favorite nesting place."

Hedgehogs not Porcupines.—Lincoln, Me., Feb. 27—Editor Forest and Stream—In your issue of Feb. 16. I read an interesting article on "Hibernation of Animals" by C. F. Holder. Among the animals he enumerates as remaining dormant during the winter is the hedgehog. I don't question his statement that they are sound sleepers, but I think he must be mistaken in regard to their hibernating, at least I have frequently seen them during the winter months, particularly on moonlight nights when feeding upon the bark of hemlock trees, for which they appear to have a particular liking. They will bite the "boughs" from the limbs in getting to the most tender bark (I presume this) and I have seen the snow under the trees where they have been feeding, completely carpeted with them. Have seen regularly beaten paths in the snow, where they have traveled from one group of hemlocks to another. Have seen them in these paths during day time, but this is an exception, as I have most commonly seen them nights as before alluded to.—F. C. P. [Our correspondent has fallen into an error for which local nomenclature is to blame In certain portions, if not the whole, of New England, the Canada porcupine is wrongly called the hedgehog. The animal referred to in the article on "Hibernation of Animals" is the true hedgehog, (Brinaceus Europews) which is not found on this continent. The porcupine and the hedgehog have scarcely anything in common except their prickly armature, and if any one will compare specimens of the two animals, he will see that even these are widely different. The porcupine belongs to the order Rodentin, which includes the beavers, squirrels, and hares, and the hedgehog to the Insection, with the shrews and moles.]

HABITS OF WOODPECKERS.—An extract from the report of the committee on ornithology of the Western New York Horticultural Society, delivered by Mr. Chas. A. Green, chairman, at Rochester, N. Y., is of interest in connection with observations recently printed in the FOREST AND STREAM. It is as follows: The redheaded woodpecker is classed among migrating birds, but I have often seen him in protected positions during winter in this vicinity. On the 26th of December I heard a familiar drumming in the orchard, and on scarching found Master Redeap pecking away as though for dear life, at the juncture of a decayed limb. I drew quite close, but he was not alarmed, but kept his eyes on me, at the same time drilling away like a steam pile driver. He has followed the specialty of dislodging insects so long he might learn their whereabouts and direct, his beak, though blinded—a rebuke to men who are jacks of insects so long he might learn their whereabouts and direct his beak, though blinded—a rebuke to men who are jacks of all trades, but master of none. He is an active, solitary bird, reminding one of those energetic people who are too busy to visit, or gossip about their neighbors. He sometimes has a companion, but seldom lets her interrupt business. Aside from insects, he rivals the boys in searching for and stor-Aside from insects, he rivals the boys in searching for and storing nuts; acorns, chestnuts and beechnuts are his delight, and woe to the intruding robber, be he squirrel or brother, who dares to test the wares in his storehouses—the stumps and hollows of trees. By way of dessert he is not averse to a ripe harvest apple or peach, and when cherries ripen he drops other diet in proportion to the quantity and quality of cherries to be had for the picking. Master Redhead is not so commonly seen as of old, which I regret, for all our woodneckers are good friends. peckers are good friends.

The Emperor Goose in Iowa.—Algma, Iowa, Jan. 20.—
Editor Forest and Stream: I noticed several communications in your paper in reference to the snow goose and the blue goose, and although many writers have claimed that they are the same bird, yet I have never considered them so, and have always looked upon them as two distinct species. They differ in shape and color. Their bills and legs are not the same color, and I never considered the blue goose as good eating as the snow goose. We have large flights of these birds in Northwestern Iowa sometime in September or October, and the weather is often quite warm when they come birds in Northwestern Iowa sometime in September or October, and the weather is often quite warm when they come down from the north. They go to the same lakes and feed in the same fields as the white-fronted and Hutchins geese. Last spring we had quite a little flight of the snow and blue geese, and I shot an emperor goose that came to a field where I was shooting, with a flock of snow geese. It is a splendid bird, and the only one I have ever seen in Iowa. I mounted it and have it in my collection:—J. G. SMITH.

Lake Mohegan, N. Y.—In the early part of the season woodcock were quite plenty and quite a number were shot. Quail are scarce; none have been shot worthy of mention. Ruffled grouse are almost entirely swept away from the sportsman and dog. But a few years ago a sportsman could go out for a short time and bag a half dozen with ease, but now they have left us. Gray squirrels are found in the woods in large numbers, I shot twenty-seven during the month of October.—Lorsella.

RARE WINTER BIRDS.—Mr. James McCormick, of Syracuse, N. Y., writes us: "I did kill three English snipe and one rail on the 9th of January, this year. The president of the Onondago Sportsman's Club, as well as others, saw them. They were killed on a small marsh on the west side of Onondago Lake, near the blast furnace, where a stream of warm water is constantly running from it, and spreads over the marsh, which affords good feed. The birds were all in fine condition.—James McCormick."

Taunton, Mass., March 4, 1882.—Bluebirds, robins, marsh quails and golden-winged woodpeckers are here, but not as if they wish they had not come. The markets here contain quite a number of ducks and prairie chicken. I have seen a large number of common yellow birds or gold-finches at different times this winter.—John C. Cahoon.

Game Bag and Gun.

HOW TO CHOOSE A GUN.

IN buying their guns, sportsmen should consider carefully what sort of game they are likely to shoot the most, and choose accordingly. This is the first thing to be thought of, the price and quality is a secondary affair, which can be settled later.

choose accordingly. This is the first thing to be thought of, the price and quality is a secondary affair, which can be settled later.

When the shooting is of such a character that the gun has to be carried around very little, it is just as well to get a large size, so that the heavier loads used will do no more damage to the game. For geese and ducks from a point or sneak-box, the greatest shoulder-guns that can be handled are single-barrel four-bores, weighing about eighteen pounds. These are full-choked and carry in the cartridge ten to twelve drachms of powder, with three ounces of shot on top. They will occasionally kill over a hundred yards off, and are such powerful shooters, that good shots under that distance can kill single birds sitting nearly every time. The barrels are forty-four inches or more long, and although they cannot be aimed so quickly as a short gun, stay without "wobbling" when once sighted at an object. Some of these have elevating rear sights for long range, but I think they would prove to be more troublesome than useful. Another good heavy gun for those that prefer a double-barrel, is an eight-bore weighing fourteen pounds or under; all over this are too clumsy to shoot easily, as they are not so well balanced as a single barrel. The charge is eight drachms of powder, two ounces of shot, B for geese, No. 4 to 6 for ducks, according to the kind. Of the two guns just mentioned, I think that under most circumstances the four-bore is to be preferred. It is almost as destructive in flocks as both harrels of the other, besides having a greater range. Both of these kind of that under most circumstances the four-bore 18to be preterred. It is almost as destructive in flocks as both barries of the other, besides having a greater range. Both of these kind of guns are rather expensive to buy, and can generally be made only to a special order. They should be bored for close shooting, to do away with the trouble of wire and thread-wound cartridges so often used in cylinder, breech and muzzle-load-

only to a special order. They should be bored for close shooting, to do away with the trouble of wire and thread-wound cartridges so often used in cylinder, breech and muzzle-loading guns.

When ducks are jumped in lakes by boats and shot over decoys in the rivers, something that is lighter and more easily handled must be used. A ten-pound ten-bore, such as professional trap-shooters generally have, is the most suitable weapon; it will do for shooting the larger kinds of bay snipe at the senshore, as well as occasional duck shooting there. The charge for this should be five drachms of powder, one ounce and a half of shot. At pigeons and glass balls it has been the favorite for some time with Americans. In England, however, they have guns from two to three pounds lighter, because many of the clubs handleap or bar out those over a certain weight. For trap-shooting, I think that light guns should be chosen always by persons who are not strong or well developed physically, because the quickness they acquire with handling these pieces, more than compensates for the heavier loads they are able to use in the other. What most people need that go shooting, however, is a gun for the field, one that will do for quails, snipe, woodcock, grouse, etc., which is not too heavy to be carried all day easily and yet will kill the game. An eight-pound, twelve-bore suits exactly for this. It takes three drachms and a half of powder, with an ounce and one-eighth of shot in the cartridges comfortably, giving but little recoil. This is for people of ordinary physique; of course those who are not capable of much endurance can choose still lighter. There are other kinds of game which are killed so easily, that the smallest charges are large enough to shoot them with. Such are woodcocks and rail. A gun made on purpose for these birds should be a sixteen, or possibly a twenty-gauge. In the former case it would weigh from six to seven pounds, and in the latter from five to six. One of the neatest rail guns used below Philadelphia Tast seas

who are getting to be quite numerous now—say to the contrary.

In purchasing a gun the fit at the check and shoulder is a very important matter, as well as the length of stock, all of course depending on the kind of man. Some tall men do not take much drop at the stock, because they may have high shoulders or short neck, but they do take a long stock nearly every time to accommodate their length of arms. The best way to find out if you do not know what measurement you take in guns, is to try some in a gun store until one is picked, up which suits, then measure it and make a note at the time for future convenience. Always get a gun with a pistol grip, it gives the land a firmer hold around the stock, as well as enabling the gun to be handled easily. Patent fore-ends are useful things, but some of them are so made that they weaken the hinge on which the barrel swings. The best action I know of is the top snap lever, it is always before the eye and a glance will tell whether it is securely locked or not; it does not get in the way of the hands when loading the gun, or is not so liable to break the spring, as other styles.

Guns of any good maker that are made now come from the factory already choke-bored, so it is not necessary to send them to a gunsnith to be rebored for a desired pattern, as was formerly the case. It is always befter to have a gun made such a pattern as you wish when ta is manufactured, because any further boring is sometimes apt to injure the shooting, as often as improve it. Many gunsmiths do not thoroughly understand choking a gun properly, and their attempts to try it only succeed in spoiling the barrels altogether, requiring a new pair to be put in to get good shooting from.

There are several kinds of choke-boring practiced by the trade, among them the jug or full choke, the modified and the taper choke. The first consists of a chamber cut out by an expanding bit near the muzzle of the gun; its shooting is very irregular, however, and should never be applied to light guns, on account of th

dred dollars for instance—the Americans are far ahead; while in the highest grades the elegantly finished weapons turned in the highest grades, the elegantly finished weapons to out by the English crack makers cannot be beaten be

In conclusion, I will state that choosing a gun from the In conclusion, I will state that encouring a gun from one reputation its maker has achieved is always a safe way to buy. The various makes have all some peculiar advantage or patent, such as levers, fore-ends, extension-ribs, locks, etc., not possessed by others, which the purchaser picks out to suit his fancy, after having assured himself first of the shooting qualities and workmanship of the guns in question.

C. W. T.

THE DESTRUCTION OF LARGE GAME.

WHERE DOES THE BLAME LIE?

WIERE DOES THE BLAME LIE?

In your issue of Feb. 2 is a letter from "W." on the destruction of large game, and I ask for a little space to reply to it. As an army officer, who has been stationed for several years on the frontier and paid much attention to game, I desire to take exception to that portion of the letter in which English sportsmen are classed with skin-hunters. If a residence at various points, from the Mexican border to that of British America, may be considered a sufficient to that of British America, may be considered a sufficient to that of British America, may be considered a sufficient on the British and the same of the majority of the majority of the majority of whom are gentlemen and sportsmen of experience, who have hunted in other parts of the world and have enough self-control not to shoot at every living thing they see, and not to kill game wantonly. There are, of course, exceptions, but I think the above is true, as a rule. That it is so "W." practically admits; when he says "that they hunt in season and kill only

are gentlemen and sportsmen of experience, who have hunted in other parts of the world and have enough self-control not oshoot at every living thing they see, and not to kill game wantonly. There are, of course, exceptions, but I think the above is true, as a rule. That it is so "W." practically admits, when he says "that they hunt in season and kill only males is not to the point," but I maintain that nothing could be more to the point, and would like to ask "W." if he thinks as much can be said of our own parties of hunters, aye, or of five per cent, of them. If so, his observations have been very different to mine.

I am not speaking of skin-hunters, for it is admitted by all that they are one of the principal causes of the approaching externination of our large game in the West. Next, and very near to them, I would place parties of alleged sportsmen from all parts of the United States. Exceptions I again admit, but I do not think that anyone who has had many opportunities for observation, will deny that most of these parties kill without the slightest regard to close seasons, to their need of meat, or to the age or sex of the game. I further affirm that for every single head of large game killed by these parties, six others, at the very lowest estimate, are wounded and lost, dying of their wounds after hours and days of suffering. This is partly from incapability and carelessness in looking for a wounded animal, partly because we rarely use the double express rifle for large game, thereby showing ourselves as far behind the times as if we still used flint-locks for feathered game. To my mind there is no more contemptible and unsportsmanlike sight than to see a man empty a repeating ritle at a band of running antelope four or five hundred yards away. He knows perfectly well that while he may wound some, there is but the slightest chance of killing any, and yet he will blaze away as long as the band is in sight and call this sport.

Is potting a bevy of quail on the ground any worse than this, or as bad?

Buf

neglect of duty.

There is a growing sentiment against many of these things, and our true sportsmen, though few in numbers, are the equals to any in the world; but there is no time to lose if we wish to save any game for our grandchildren.

My own advice is this: Pass good laws with severe penalties for their violation, and enforce them "without partiality, flavor or affection."

MONTANA, February, 1882.

A CONVERTED GROUSE SHOOTER.

A CONVERTED GROUSE SHOOTER.

In reading the article of your correspondent "X" in a recent number of Forest and Stream, "On the Wing or on a Log," I am reminded of a funny occurrence which happened to me last October. One evening I took my dog and gun and went down the Potomac River about a mile to my favorite woodcock ground, thinking I might get a shot or two, and had met with some success, so that I was rather later than usual starting for home; but if a bird had got up high enough I could still have made it pleasant for him. This reflection was running through my mind, when my dog made a beautiful stand in a small clump of willows ahead of me, I, of course, thought it was a woodcock, and called to him to hie on. He tried to obey me, but after he had made a very faint effort, he gave it up and stopped again. Being a little provoked at him, as he never refuses to flush, I made about two steps toward him, when right at my feet there was a whirr and a buzz, and I was so taken by surprise that I did not recover myself in time to get a shot. I need not tell you it was a grouse, or as we call them here, a pheasant; I marked him down, and sent the dog forward again, but this time he did not lie so close, but got up with a large tree between us; and I did not get a shot again. By this time I was ready to shoot him anywhere I could catch him, and concluded, if possible, to get him on the ground. When we got to about where I thought he ought to be the dog stopped again, and I began looking very cautiously in all directions on the ground, and there he lay alongside of a small drift pile. I took deliberate aim at his head, as that was about all I could see of him and such another fluttering and jumping you never saw. I started to pick it up, and you can judge of my disgust, when I tell you it was a farmer's old hen which had wandered off from the farm and was hovering a brood of six or seven small chickens. I cannot account for the dog standing the chick-

ens, as he was raised among them, and I never knew him to stand one before, although he kills one every now and then for amusement, but only does it by playing with them. I then and there concluded I would not kill any more pheasants on the ground, even if I were shooting by moonlight, and so far I have kept my promise, although I have had several opportunities of breaking it, and have since had the pleasure of killing two after kicking them up from in front of the dog. But to finish my narrative, I concluded to go the farmer, make a clean breast of what I had done, and pay him for the old hen and her brood. Although I did not know it, he had been an unseen witness of the shot, and when I got to him he asked, "What did you kill? I saw you shoot something but did not see you pick anything up." I then related what I have told above and offered to pay him whatever damage he thought was right; but he refused to take anything, saying he had another old cluck which would take care of the brood, and he did not want any pay for the old hen. But he has since been paid twofold, for every time I go near him now with a gun he remarks, "Hold on until I pen up ny chickens," but I tell him he need not be alarmed as I don't kill pheusants on the ground any more.

Cumerland, Maryland.

WILD FOWL IN CALIFORNIA.

WILD FOWL IN CALIFORNIA.

O'UR open season for most kinds of small game is drawing to a close. In less than three weeks from this time the hourly reports of the shotgun, now heard from one end of the State to the other, will cease, and the mallard, the sprig, the teal, the canvas-back, the blackjack, the widgeon and all the other ducks will begin to take up their line of flight for the north. Throughout the Sacramento and San Joaquin valleys, however, many ducks—such as mallard, bluewinged teal and redheads—remain and breed among the vast beds of tule or swamps that line the two principal rivers of California. These home-bred ducks furnish our first sport at the opening of the season, the 15th of September. Long before that date—say as early as the 1st of August—the young begin to fly, and the finest ducks we have are those shot soon after the opening of the season. It is useless to say anything, perhaps, of the too prevalent custom, among a certain class, of shooting the young ducks before the open season arrives, for they will do it until somebody is badly "cinched." I have known men to resort to all sorts of deception and cunning in order to steal out of town and slay the young floppers, but whose zeal for duck-shooting seemed to subside assoon as the law protecting (?) the ducks expired. Anything that can be got illegitimately and in an unsportsmanlike manner seems to have a tenfold attraction in the eyes of some men over that secured in a gentlemanly, legal way. But, despite this army of bushwlacking shooters—among whom are often to be found members of sportsmen's clubs which profess to "protect game and encourage a healthy taste for field sports"—there are usually enough young birds left to furnish pretty good sport until the "immigrants" from the north begin to put in an appearance, which is usually with the first rains in October. The first to come are the widgeons, teal, mallard and sprig, and later on the lordly canvasback and his smaller cousins, the blackjack and blucbills. There is probably no part

sportsmen and small boys, prevents them from staying in the more accessible places.

Duck-shooting for the market has been a regular business in this section for the hast thirty years—ever since the country became settled by the whites. To-day I met with one of the veteran hunters of the Sacramento Valley—the most noted, probably, of those still engaged in the business. He broke up his camp on one of the islands in the lower Sacramento three weeks ago for the reason that the ducks had commenced to get poor, owing to the freezing over of the more shallow ponds in which they were wont to feed. For the last two months he has shot only canvas-backs, for which he received in the San Francisco market from \$2.50 to \$4 per dozen. There is a great deal of wild celery growing on these tule islands, and in mild seasons the ducks are very fat. The person referred to has hunted almost in one vicinity every year since 1852, and has made a great deal of money, often averaging for the season from \$300 to \$400 per month. He generally has a partner or an employe with him, and it is a poor day's shoot that does not bring them from 80 to 100 ducks to the gun. He informs me that many years ago he furnished one firm in Sacramento \$9,000 worth of ducks in one season, and I can readily believe it, as there were few market-hunters in those days, and half a dozen or so enjoyed a monopoly of the business. To day the country is full of men shooting for the market. Whenever a fellow finds himself out of work and doesn't know what else to do, he procures an old gun and goes on the warpath against everything that flies. Then, the farmer and his boys occasionally come to town with a hoad of wild ducks killed on the 'ranch,' or a bag of qualis which little Johnny caught in a trap in the nearest thicket. And this is not all, for many of our city 'sportsmen' make a regular practice of slaughtering all the game they can and selling it. It is safe to say that three-fourths of the ducks sold to dealers in this city are killed by men who would be ve

would be very indignant if one was to call them market bunters.

Now, I rather like some of the professionals. I am well acquainted with a number of men who regard it as perfectly legitimate to shoot for the market—free, generous, honest, open-handed, law-observing men they are too—men who have as much contempt for anyone who kills game out of season as any sportsman could have. But I also know of men that shoot for the market who kill their game whenever and wherever they can—at night, on the feeding-grounds—anywhere, so that they can fill their wagons and have something to boast of the next evening when they gather at their rendezvous. These creatures always come home under cover of the night, and sneak around unseen to the back doors of the poultry stalls to sell their game. I tell you it is a difficult matter to enforce anything like a proper observance of the game laws in communities where this style of self-termed sportsmen predominate.

has often been spoken of as a sportsman's paradise, and not inaptly. (It remains to be seen, however, how long it will be so.) A stranger happening in Sacramento to-day would no doubt have been greatly surprised at the quantity and variety of game to be found at the markets. In front of one little stand I noticed on the sidewalk a pile of wild ducks, consisting of almost every known variety, at least as high and broad as the average cord of stovewood, and beside another of geese of four or five kinds, nearly as large. In addition to these, piles of game were hanging all about, wild swans, sandhill cranes, hares, rabbits, quails, robins, and other small game. These were all killed within a few miles of Sacramento.

mento.

On the 15th of March our close season commences on all the above kinds of game, except geese and hares, but by that time the spring suipe will be along. They generally stay for a month or so, and of course furnish excellent sport. But, as I expect to refresh my memory shortly, in regard to these lively little fellows, I will defer writing of them until my next.

next.

I cannot close without expressing my admiration for the Forest and Stieam since it donned its new dress. Fine feathers do make fine birds, as every sportsman knows; and while in appearance the Forest and Stieam is all that the eye could wish, its contents have a still greater attraction for him who is ever athirst for knowledge on all subjects pertaining to the sports of the field.

Nimeod.

Sacramento, Feb., 1882.

THE OHIO GAME LAW.

WAUSEON, O., March 2, 1882.

Editor Forest and Stream:

Editor Forest and Stream:

I inclose copy of the proposed new game law for Ohio. I have underscored the changes. No one who has had experience in this matter can believe for a moment that this theory of game protection will, if carried our, protect. It has been tried in Ohio two or three times before, and found wanting. When the farmer learns that the gentleman, who shoots for pleasure, health and recreation merely, is not the man who tears down his fences, destroys his crops and injures his stock, but is his friend, and with him interested in frowning down rufflanism and lawlessness, then may we hope for a "pooling of issue," and reasonable game laws rigidly, enforced. The bill is as follows:

"A bill to amend section 6961 of the Revised Statutes of

A bill to amend section 6961 of the Revised Statutes of

"A bill to amend section 6961 of the Revised Statutes of Ohio. "Sec. 1. Be it enacted by the General Assembly of the Stato of Ohio, that section 6961 of the revised statutes be so amended as to read as follows: "Sec. 6961. Whoever, in any place, catches, kills or injures, or pursues with such intent, any quail or prairie-chicken, before the fifteenth duy of November, one thousand eight hundred and eighty-five, or after said date, between the first day of January and the first day of January and the first day of January and the first day of November, inclusive, or any wild turkey between the fifteenth day of January and the first day of November, inclusive, or any mallard or wood-duck, or other wild duck, between the first day of January and the first day of September, inclusive, or any mallard or wood-duck, or other wild duck, between the first day of July, inclusive, or catches by snare, or trap, any quail or Virginia partridge, or upon any waters, marshes, or in any cover to which wild fowl resort, by the aid or use of any swivel or punt-gun, or any other gun than a common shouldergun, or by the aid of a push-boat, or sneak-boat, used for carrying such swivel or punt-gun, kills or wounds, or pursues with such intent, any wild goose, wild duck, or brant, or disturbs or destroys the eggs of any such birds, shall be fined not more than twenty-five nor less than two dollars, or be imprisoned not more than thirty days, or both.

"Sec. 2. That said section 6961 of the revised statutes be not more than twenty-five nor less than two domes, of the imprisoned not more than thirty days, or both.

"Sec. 2. That said section 6961 of the revised statutes be and the same is hereby repealed.

"Sec. 3. This act to take effect from and after its passage."

W. H. H.

NOTES FROM WORCESTER, MASS.

NOTES FROM WORCESTER, MASS.

DURING the last five or six weeks your correspondent has been unable to pick up any notes of interest. Neither is there anything very exciting going on just at present. The annual meeting of the Sportsmen's Clad, which occurred Wednesday evening, March 1, at the Bay State House, and a recapitulation of the fox-hunting scuson, with one or two minor items, must furnish the material for this letter. The annual meeting of the club was largely attended, and was exceedingly pleasant in every respect.

The reports of secretary and treasurer were entirely satisfactory, and showed a membership roll of sixty-seven names and a handsome amount of cash in the treasury. And right here let me say, that since the formation of the club, about ten years ago, there has never been an assessment, and never has been a time in which there was not a sufficient sum in the treasury for any enterprise in which the club might wish to embark, such as getting up tournaments, entertaining other clubs, etc., and of which we have done not a little. After the report came the election of officers, which resulted as follows: President, Gilbert J. Rugg; First Vice-President, Wm. S. Perry; Second Vice-President, Maj. L. G. White; Secretary, Stedman Clark; Treasurer, O. L. Taft; Executive Committee—E. S. Knowles, A. B. F. Kinney, W. L. Shepard and J. B. Goodsell. After the regular business had been disposed of, the meeting adjourned and resolved itself into a social meeting, and remained till a late bour as the guests of some of the newly elected officers, who entertained the party handsomely. We are feeling very happy over our new president. Mr. Rugg is a member of the old and well-known firm of Witherby, Rugg & Richardson, mamtacturers of wood-working machinery. He is a man of character and ability, a thorough and thrifty business man, and an enthusiable sportsman. He has every qualification and, we fully believe, will make a model president. The clu never was stronger nor in a more flourishing condition than a present

The fox-hunting season closed Feb. 28, the local hunters as much contempt for anyone who kills game out of season as any sportsman could have. But I also know of men that shoot for the market who kill their game whenever and wherever they can—at night, on the feeding-grounds—anywhere, so that they can fill their wagons and have something to boast of the next evening when they gather at their render-nearest to be plenty left, as it was very easy to start a fox on any passably good day up to the close of the season. The hunters the night, and sneak around unseen to the back doors of the he next evening when they gather at their render-nearest the night, and sneak around unseen to the back doors of the names given below are residents of Worcester, except the night, and sneak around unseen to the back doors of the markes given below are residents of Worcester, except the night, and sneak around unseen to the back doors of the granter to enforce anything like a proper observance of the game laws in communities where this style of self-termed sportsmen predominate.

But we will dismiss this part of the subject, California

John R. Thayer, I—total, 71. A good many foxes to be killed in and about a city of sixty thousand inhabitants.

After the recent heavy snow storms, grave fears were entertained by the sportsmen here that the qualishad, for the most part, perished. Since the storms, however, reports have come in which give the matter a more hopeful look, several large bevies having been seen. Robins and bluebirds have been seen about here for more than a week. The Rife Club, after getting fairly settled in their new club house at Lovell's Grove, were notified to stop shooting, as the balls were heard to whizz unpleasantly near some of the houses in the neighborhood.

They are now looking for grounds which shall be pleasantly located, and where they can practice safely.

K.

ST. LAWRENCE GAME CLUB.

ST. LAWRENCE GAME CLUB.

THE annual meeting of this association was held at the office of the sceretary in the city of Ogdensburg, March 1, 1882. The president, L. D. Hoard, read his report, which was adopted.

Mr. Soper moved that the meeting appoint a delegate to attend the State Convention at Albany March 15. The motion was unanimously adopted, and L. D. Hoard was named as such delegate, with power of substitution.

W. R. Peters addressed the meeting on the importance of conferring with the district-attorney as regards the prosceution of the offenders of the game law, and suggested that the chair appoint a committee of three to so confer. The president appoint a normalite of three to, so confer. The president appoint a such committee, W. R. Peters, J. McNaughton and Jno. Webb, Jr. Mr. McNaughton moved that a committee of three be appointed to select suitable persons for trustees for the ensuing year. Carried. The president named as such committee, J. McNaughton, Albert Chismore and E. F. Bearsdlee. The committee reported as follows: For trustees—E. F. Beardslee, of Gouverneur, S. A. Redway, of Potsdam, A. F. Nims, of Canton, James R. Smith, of Russell, and J. Newell, of Ogdensburg.

The trustees retired for the selection of officers for the ensuing year, and reported the following: L. D. Hourd, President, Ogdensburg; E. F. Beardslee, Vice-President, Gouverneur; N. W. Howard, Secretary and Treasurer, Ogdensburg.

J. McNaughton, Esq., addressed the meeting on the im-

The trustees retired for the selection of officers for the ensuing year, and reported the following: L. D. Hoard, President, Ogdensburg; E. F. Beardslee, Vice-President, Gouverneur; N. W. Howard, Secretary and Treasurer, Ogdensburg.

J. McNaughton, Esq., addressed the meeting on the importance of protecting game and fish in this county, and especially in the Adirondack region, discussing the inefficiency of the present game law of the State, and urging the members of the club to do all in their power for the passage of an act that will easily convict those who unlawfully slaughter game and fish.

E. F. Beardslee suggested the necessity of securing the services of a game protector for this part of the State.

Mr. Reynolds made some remarks upon the interest that would be awakened in the right direction, by publishing in all the county papers the proceedings of the annual meeting of the St. Lawrence Game Club. It was so ordered.

Jno. Webb, Jr., offered the following resolutions which were unanimously adopted:

Resolved, That the existence of a matured public sentiment demanding the protection and culture of the best animal products of our forests and waters, and in favor of the appropriations made by the State in aid of such purposes, is matter for public congratulation, and demands from the people energetic action in the enforcement of the laws for the preservation of their game and fish.

Resolved, That we appeal to a law-abiding and sympathetic public sentiment to aid our efforts to suppress the lawlessness of classes and persons who habitually resort to our forests and streams to pursue their work of destruction of game and fish, regardless of every consideration but that of personal greed, or the gratification of a morbid passion for wanton and indiscriminate destruction.

Resolved, That we invite the people in the counties comprised wholly, or in part, in the section known as the Adirondack region, to form associations for the protection of game and fish in their respective counties, so that by the interch

Foxes on Ice.—Hartford, Conn., March 4.—In your last issue "E. A. R." gives an instance of a fox crossing ice and the dogs following the trail by scent. I have more than once witnessed the same performance, but in every case the fox has been wounded or foot-sore. I have also seen the dogs thrown out many times by the fox taking to the ice. Two years ago while fox hunting I saw a wily varmint who was some distance ahead of the dogs, leave the highway in which he was running and make a bee line for a pond nearly half a mile distant that was frozen over. As soon as he was on the ice he commenced rolling over and over until he had got three or four rods from the shore, when he gathered himself up, and throwing his head in the air to listen for the dogs, he shook himself and then retraced his steps to the road, when her an a short distance toward the dogs, and then turning at a right angle soon disappeared. I was some distance away, but anticipating trouble started for the scene. The dogs arrived there before I did and it was a long time before I got them straightened out. In this instance the dogs could smell the scent upon the ice much better than they could upon the ground, which was undoubtedly just the result calculated upon by designing vulpes when he took so much pains to leave it there.—Fox Hunter,

GAME ABOUT PHILADELPHIA.

GAME ABOUT PHILADELPHIA.

OUR Philadelphia sportsmen who have visited the New Jersey buys during the past week have been well rewarded. Goese, brant and black ducks are now numerous in these waters. The writer saw several large bags brought into Kriders a day or two since and learned from the fortunate duckers that fowl of all kind have been plentiful for a fortnight, and the baymen expect their presence until the middle of March to the last of the month. At Havre de Grace and the Bush and Gunpowder rivers canvas-backs are numerous, retheads being less in numbers than earlier in the season, and Monday last, "ducking day" at Havre de Grace, almost every boat was the lucky one. All that went out were well rewarded. Had there been more wind the number of ducks killed would have been larger; as it was many were brought in. At Port Penn, Delaware Bay, a few saipe have been killed—only the earlier comers. We cannot argue from the killing of these half dozen stragglers that the main flight is near; still we may expect them sooner than usual the present spring. All the curly migratory birds have arrived in the region about Port Penn, and the shad fishermen are preparing their nets in advance of last years' date. We have heard of the spring arrival of a pair or two of woodcock near Philadelphia, and their quiet settling down in swamps where they yearly breed. Should the first fortnight of March be balmy and springlike, without stormy weather, our sportsmen will surely find and kill snipe all along the Delaware River meadows from Woodbury Creek down to Salem Creek on the Jersey side and on the numerous feeding grounds on the Pennsyvania and Delaware side, which are yearly visited by our favorite bird. The duck shooting on the Delaware River the past month has been poor, not from lack of fowl, but on account of the open weather we have had, which has allowed the continual harrassing of every flock of ducks which has made its appearance. Our veteran Delaware River duck-shooter, Mr. T. Conway, has in the past two weeks cont

SNIPE-SHOOTING GROUNDS.

SKIPE-SHOOTING GROUNDS.

As the snipe shooting season approaches, many of your readers are doubtless making up their minds as to where their tramping grounds will be selected this spring. I have generally been a little selfish in imparting the localities of the sections of the country where I have been usually fortunate in finding birds plentiful, but at your request shall give for publication a few points relative to the finding of these grounds, which I am sure, should the sportsman hit the proper weather, it will repay him to visit.

In the neighborhood of Milford, Delaware, the Slaughter Neck marshes abound with snipe: also the Prairie Hook marshes; but at Milford don't stop at a hotel. Write to Mr. John Wooters. He knows the grounds, and is moderate in his price for board, pilotage and team.

At Milton, which is reached by stage from Ellwood station on the Delaware Railroad, I have always found fine snipeshooting. A team from Milton to the Drawbridge over Milton Creek, five miles from the town, will put the sportsman right among birds that are seldom if ever shot at. This last place is difficult to be got at, hence the certainty I experienced of having good sport. It will well repay to visit these places, but a license of \$5.00 is required of every non-resident of Delaware shooting in the State.

I would advise a trip of a full week to anyone desirous of wanting to shoot at these points, and the carrying of a No. 5 and 6 shot for marsh duck-shoot-

I would advise a trip of a full week to anyone desirous of wanting to shoot at these points, and the carrying of a No. 10 gun and shells of No. 5 and 6 shot for marsh duck-shooting, which can always be had in the spring of the year, especially at Slaughter Neck marsh. As to choice of time of starting, this must be made according to the condition of the marshes and openness of the season. I would say this year, if the spring proves open, any time after the 15th to 18th of March, or even later, would do. April 1 would surely hit it. Milton Creek is my favorite.

Loading for Game.—The subject of loads for shotguns is something to which I have given a good lot of time and thought in experimenting, both at the targets and in the field. I give the results of my experimenting. First, in regard to the load of shot, it should not, when in the barrel, exceed in height the diametre of the bore to get the best average results of both penetration and pattern, which will be for a 12-bore 140z. 10-bore 140z. As soon as the shot exceeds this the enertration fells off—with heavy powder charges very much so—and, consequently, the range; 10z. of shot and 4drs. of powder gives about the same pattern, but 18 per cent. better penetration than 3dr, and 15z. But 4dr, and 14pz. gives only 7 per cent, better than 3dr, and 14pz., though the pattern is the same. The gun I use for most everything is a 12-gauge, \$\frac{1}{2}\text{Bus}, 3\text{0ins}. The pattern is the same with 3 and 4dr, of powder, and it puts about 54 to 67 per cent, of the load in the 30in, circle at 40yds; 14oz, gives about 13 per cent, more than 10z. The following is the penetration of various loads taken from the averages of several shots with each load. The penetration is in hundredths of an inch:

neder, Shot, Pen, Powder, Shot, Pen, Powder, Shot, Pen, 3dr, 10z, 44 3½ 10z, 48 4 10z, 53 3dr, 1½0z, 43 3½ 1½0z, 47 4 1½0z, 53 3dr, 1½0z, 42 3½ 1½0z, 43 4 1½0z, 45

3dr. 140z. .42 3½ 140z. .43 4 140z. .43

The following loads I use in the field with good effect: For geese, 4dr. powder 1½0z. No. 1 or B shot; ducks, 4dr., 1½0z. No. 5; ruffed grouse, 3½dr., 1½0z. No. 7; quail and woodcock, 3dr., 10z. No. 9; ruly snipe, 3½dr., 10z. No. 9; rul, 3dr., 5pz. No. 9; upland plover, 3½drs, 1½0z. No. 8. Loaded in all cases with one cardboard wad, with two pink edge, except for quail, woodcock and snipe, where one pink edge is used. The one felt wad on powder does not drive so hard, and tends to scatter the shot more than two felt wads.—De HAVEN (Philadelphia, Pa.)

Charleston, Coles Co., Illinois, March 3.—On the 1st inst., William Hughes and John Cartright were out for a day's shooting about eight miles north of here on the prairie, and they bagged one sprigtail and eight mallard ducks. They saw a few killdear. They report the prairie a sea of water. Brant, geese and killdeer are scarce, rabbits and ducks by the hundreds, quail and pinnated grouse are tolerable plenty. In the timber, squirrels, rabbits and quail tolerable plenty, ruffed grouse and turkeys scarce. Not any deer in the county.—J. B. D.

INDICATIONS OF THE MILLENNIUM.—The following novel and entirely original view of domestication appears in the Portland, Oregon, Rural Spirit. The writer is more sanguine than sanguinary, and adopts an optimistic argument which is as beautiful in its way as anything we have ever seen. He says: "Thomas Monteith, of Albany, has a coop of about twenty Oregon quails, which he intends, if it be possible, to domesticate. "The mysterious of nature is the art of God." The wondrous development of the hitherto mysterious would seem to indicate that the Great Architect is still at work in ways that are calculated to bring man and His work and plans closer together. Those who give attention to the ways of the beasts, birds and fishes, can but recollect that there are incidents taking place which may be indicative or intended to attract our attention to the fact that the wild master is about to surrender to the more reasonable ruler, Civilization. We refer to incidents such as buffalo taking up with domestic cattle, prairie chickens with domestic fowls, quails making their nests close up to barns, and even raising their young close in, as though they appreciated man's protection. The farmer, the stock-grower, and every true sportsman will, if they give heed to such things as they are interested in, ofttimes ask themselves, Will all these things continue to be as they are now? The Great Giver. Creator and Maker certainly intended that His work should be forever. It is then reasonable to conclude that the species should be continued. Experience now goes to show that the species cannot, or at least will not, continue in the wild state. Man is too aggressive. We conclude, therefore, that when the wild animals and birds are robbed of their homes, that it may be that the God of nature may compromise, and man, beasts and birds will become pets of him who was to have dominion over them."

and birds will in time become pets of him who was to have dominion over them."

The Minnesota Association is getting down to work, and an active canvass is being made all over the State for additions to the membership roll. The idea is to have a popular association of sportsmen, each of whom pledges himself by becoming a member to observe the game laws and assist the association in enforcing them. The trouble has been that though many—very many—have been anxious to see the law enforced they have been unwilling to put its forces in motion against a friend or customer, and have shrunk from drawing upon their individual heads the odium (purely imaginary) of enforcing a beneficer law. This association, however, changes all that. On general information received the officers of the association will act, and the law will be enforced, not by a one-man power, but in the name of the associated sportsmen of Minnesota. It is absolutely of paramount interest not only for every sportsman, but for every man who wishes to attract strangers to our midst to join this association at once. Do not wait till some one comes round to solicit your subscription and name, but send in one dollar, the annual dues, to the secretary. W. S. Timberlake, corner Third and Jackson streets, St. Paul, and ask for a copy of the constitution and by-laws of the association, and for a copy of the game law of the State. Prompt and persistent action now will save the State of Minnesota all the money and trouble that the older and more custerly States, Michigan them to the older and more custerly States, Michigan the older and more custerly States, Michigan the older and more custerly States, Michigan the more paid into the treasury will be employed in carrying test cases to the supreme court. If that court decides the law unconstitutional, then the association will endeavor to frame one that is not, failing in which the game law absurdity will be wiped off the face of the statute books, and all will have an equal opportunity, without risk of malicious pr

Game Afloat,—The overflowed Mississippi is working ruin and disaster to the dwellers in the delta country between Cairo and New Orleans. Farms and townships are submerged in the flood. A correspondent of the Cincinnati Commercial writes of the destruction of game: The Mississippi "bottom," between the great river and the St. Francis, has long been celebrated as a sort of hunters paradise. The immense forests and interminable camebrakes afforded secure shelter for innumerable wildcats, lynxes, panthers, bears and deer, besides the smaller game, such as squirrels, opossums and raccoons. Some of these, like the squirrels, the wildcats, lynxes and panthers, can readily adapt themselves to the necessities of the situation and take to the trees. But many a black-pelted bruin has been routed from his lair by the encroaching flood, and compelled to seek preservation by taking refuge on a floating log. A gentleman just returned from Madison, on the steamer Katie Hooper, saw six monster black bears floating on one huge cypress log. Many hundreds—perhaps thousands—of deer have been caught in the overflow and drowned. Swamp rabbits and other game animals have met no better fate. The squirrels, being expert swimmers, have migrated to the highlands; but the destruction of game animals has been great.

Long Island Association.—The annual meeting of the L. I. Sportsmen's Association, was held in Music Hall, Brooklyn, March 4. The following officers were elected for the ensuing year: President, C. E. Fisk; Vice-Presidents, C. L. Havemeyer, Henry Altenbrand, Geo. Post, Robt. Robinson, Capt. W. L. B. Steers; Secretary, H. W. Thorpe, Treasurer, F. G. Chamberlin. Resignations from the Phoenix Gun Club and the Brooklyn Gun Club were read and accepted. Messrs. W. L. B. Steers, Chas, W. Havemeyer and Henry W. Thorpe, were elected delegates to the State convention at Albany. Alternates, Robt. Fury for Kings co., Judge Lott for Queens co., and G. A. Chappell for Suffolk co. As a committee of ten to accompany the delegates, the president named Messrs. Crook, Altenbrand, Chappell, Chamberlin, Post, Miller, Ackhurst, Eddy, Hedeman and McGovern. Mossrs. Geo. B. Post, C. W. Wingert and Hugh McLaughlin, were appointed a committee to secure a central club ground for the use of all the clubs belonging to the L. I. Association.

KEEPING DEAD GAME.—East Machias, Me.—Editor Forest and Stream: I should like to have some information about the best method of keeping dead game, and whether it should be drawn or left undrawn. When I am camping out I have always hung my fowls up by the neck undrawn. I never have been in the habit of drawing them until wanted for the

table. In case they were too "gamy," have sometimes thrown them away; but have always found that ducks, partridges, etc., keep for a long time during cool weather, say September and October, by simply bleeding and hanging up outside the tent after shooting.—S. H. T.

A New Duck Retriever.—Mr. Edmond Redmond, of Rochester, N. Y., the well known inventor of the diving duck decoys, makes a suggestion in his paper, the Journal, that we leave him to "work up:" One day lately we were reading about the desirability of a dog that would fetch ducks under all circumstances, when an idea occurred to us that may be worthy of consideration. It was to train hawks to retrieve. There would be no more difficulty in teaching a falcon to fetch than it is to teach them the old-time art of hawking. The only question is, would any ordinary hawk be strong enough to carry a four-pound duck or the still heavier wild goose or swan. Here would be a chance to put the national bird to some practical use. The eagle is unquestionably strong enough to carry any ordinary duck, and it would not be a bad idea to employ his storm daring pinion and sun-gazing eye to recover dead ducks. From accounts we have read about eagles swooping down and going off with decoys, we infer that the eagle has a penchant for wild duck; and if he could be trained to fetch and carry for the wild fowler, another attraction would be given to a fine sport."

The Coming of the Snipe.—Philadelphia, March 6, 1882.—Editor Forest and Stream: Everything indicates the early coming of the main flight of snipe with us. Yesterday's rain hastened a few brace, and this forenoon three were killed on the meadows at the foot of Broad street in the city limits. The veteran Mr. John Davis, of Philadelphia, has been out already, but have not heard of his bagging any, although he generally finds many of the early birds. Several local sportsmen started for the wet grounds on the New Jersey side of the Delaware River this morning in hope of finding a few. It is very uncertain yet, for we need a week of mellow spring-like weather. Yet all the migratory birds due about this time of year are ahead of their general coming a full week.—Home.

THE BUFFALO RANGE.—Fort Benton, Montana, Feb. 10, 1882.—The buffalo have made a very remarkable migration lately. Last September the buffalo were all on this (south) side of the line, in fact, nearly all on the south side of the Missouri River. Since that time fully half of them have gone north clear to Battle River and the south fork of the Saskatchewan. It is truly wonderful how many buffalo are still left. Thousands of Indians and hundreds of white men depend on them for a living. At present nearly all the buffalo in Montana are between Milk River and the Bear Paw Mountains, there are only a few small bands of them between the Missouri and the Yellowstone.—J. W. S.

WINCHENDON, Mass., March 2.—On Monday of this week members of the Gun Club went out for a hunt, sides were chosen, the agreement being that the losing side should pay for the suppers. G. Summer Lord with his party reported the capture of eighteen rabbits, while James Sutherland and party had twenty-two rabbits, two partridges, and one squirrel. Last evening supper was furnished by the losers at the American House, where rabbits and other good things graced the board. After supper a stirring speech was made by President Brown.

The Early Snipe.—Jersey City, March 7, 1882.—Editor Forest and Stream: I killed this Tuesday morning an English snipe, weight, 3%ozs. This is the earliest I have killed, Scollopax wilsonii. In referring to my field-actes, I find the earliest one killed in previous years on the 10th of March, 1880; last year not until March 31st.—G. L. W.

FLORIDA.—Maitland, Orange County, Feb., 1882.—Quail shooting has been very good the past season up to within two or three weeks. I have had a party of New York gentlemen here all winter and they have had good sport. Our table is supplied with venison all shot within a few miles from here.

STATE PARKS.—The reservation of a portion of the Adirondacks as a State park and the reclaiming of Niagara Falls are two projects now exciting deserved public interest. There can be no question of the ultimate advantage which will accrue from such action of the State.

ROCHESTER.—At the annual meeting the Monroe County Sportsmen's Club elected the following officers: President, M. M. Hollister; Vice-President, J. H. Brown; Secretary and Treasurer, L. A. Pratt. There are \$676.26 in the treasury and no debts.

Ducks on Long Island.—Port Jefferson, March 3.—Old squaws, coots and sheldrakes are very plenty here.—W. H. R.

NOTES FROM FOREIGN EXCHANGES

THE Revista degli Sports of Rome has this notice, which, we presume, refers to Judge Caton: "Un vicco signore degl Stati-Uniti si presentò al Ministro d'agricoltura e commercio proponendo l'acclimatazione del yak in Francia. Il yak è una specie di burlalo con coda da cavallo; dà un latte eccelente e con la sua Iana si fanno abiti per contadini. La stessa lana, mediante un operato, dicono che imiti molto bene il capello umano."

La Rustracion Venatoria of Madrid tells us that the outrages of the dynamite fishing fiend are not confined to this country. It reports: "Cuatro jóvenes muy conocidos en la citada villa, ancionados en extremo á la pesca, y con la saux, mala ó buena intencion de hacer abundante cosecha con el destrozador elemento de la nitroglicerina ó dinamita, y al encender, para arrojarlo al agua, uno de los varios cartuchos que llevaban en su bote ó embarcación, se les inflamó el resto de de los demas, siendo víctimas todos ellos, recogicado al uno cadáver y à los otros tres en un estado muy grave."

cadáver y à los otros tres en un estado muy grave."

La Chasse Illustrée of Paris has this, which we commend to our game law makers: "D'après le chiffre considérable des permis de chasse délivrés chaques aunée dans nos préfectures, c'est, évidemment, en Prance que l'on compte le plus de chasseurs, ou qui se disent tels, sur tous les degrés de l'échelle sociale: depuis le racommodeur de savates jusqu'au président de la République, tout le monde chasse. C'est le contraire en Angleterre et en Allemagne. Il résulte de cette mosaïque humaine des abus nombreux qui nous conduitent fatalement à la destruction radicale du gibier. On cherche un remêde au mal, et l'espoir nous reste. Le député qui aurait le courage de monter à la tribune pour proposer une loi conservatrice sévère contre le braconnage, risquerait de perdre sa popularité et déplairait aux masses."

Sea and Biver Hishing.

Hauling fish through the surf is better than wasting time in the Senate.—Daniel Webster.

THE INTERPRETATION THEREOF.

BY X.
"When the wind is in the north, when the wind is in the north,
The prudent angler goes not forth.
When the wind is in the south,
It blows the bate (fly) in the fishe's mouth.
When the wind is in the cast,
Then the fish will bite the least. When the wind is in the west Then the fish will bite the best." "When the moon is shining bright,

Seek other days for fish to bite."

If signs are the mere fictions of the brain and void of truth property or sense, then that is the end of them among sensible people. Boys may repeat them to kill time while spitting on their bait. But if they have sprung up out of the experience of some and the observations of others at all times and places, or at different times and localities, and from their truthfulness grown into proverbs sacred in the eyes of grand old Izaae Walton and his followers to this day, then it may be worth while to elaborate them a little and find out, if possible, what they mean.

In the north of England, where this first proverb probably originated, about the time in the spring when the flies begin to be plenty and the trout begin to jump for them, should a cold north wind set in the flies will all disappear from the waters, hiding away in warm cover until there be a change of wind and temperature. The trout, discovering the disappearance of their food, seek their hiding places in deep pools and under banks and logs. Occasionally one may be found in their usual haunts ready to take the proffered fly of the unbelieving angler in the 'sign,' but the 'prudent angler' in the localities where such a state of things may occur 'goes not forth.'

On any stream in any country north of the equator, in the spring and fall especially, the south wind would naturally be a warm wind, the flies would dance merrily over the water, the wary trout would be on the watch and keep up that half metallic splashing sound so delightful to the angler, and when he steals up cautiously and makes his cast 'It blows the bate in the fishes mouth.''

The northern part of England, when the east wind sweeps down from the North Sea and the cold Baltie, or in Maine, New Brunswick, Newfoundland, Nova Scotia, and Quebee, from the cold icebergs floating off the Southern coast of Laradro, across the trout streams, in the spring and fall, (as the east winds are dry and cold) the flies on the streams disappear, the trout slink away to Seek other days for fish to bite F signs are the mere fictions of the brain and void of truth

incredulous angler too late discovers that—"Then the fish will bite the least."

But when the vitalizing west winds sweep up from the warm currents of the Gulf Stream on the shores of England and North America, the files swarm in myriads, the fish (trout especially) are alive to the proffered chance for a good dinner and leap to every lure—"Then the fish will bite the best."

Exceptions may be found in the heat of summer, when all winds are warm, or in streams so protected by mountains or forests as to be little affected by any winds, but this only proves the truth of the signs.

Although "C. T. D." may have fallen into the trap set by the Forest and Stream on the "worm question" he is sound on the "moon question." Fish do bite best in the "dark of the moon."

When the moon shines bright during the night, minnows come to the surface near the shore and huddle together in swarms; then the trout, bass, pike and pickerel strike for this bonanza and gorge themselves to repletion. Being full, the fish retire to their hiding places, and remain there until the process of digestion is completed and hunger drives them forth to seek more food. This may occur in eight or ten hours.

forth to seek more food. This may occur in eight or ten hours.

Hence it is idle to fish for trout or bass when the moon shines at night, until about three or four o'clock in the afternoon, with any assurance of getting more than an occasional rise. When there is no moonlight at night the fish do not feed, and if the days be cloudy, rainy or windy, the 'signs' are right, and the chances are largely in your favor for a good day's sport and a full creel.

To 'spit on the bait' is not a sign, but a fact; so with anise seed and assafetida (recommended by our patron saint, the great and good Walton), and if these won't 'fetch 'em," no extraneous application will. Let the boys spit on their bate—just as good as assafectida.

RANGELEY NOTES.

SINCE the season closed, the proprietors of Forest Retreat, Messrs. Richardson and Grant, Lake Kenebago, have enlarged their main camp, and will erect a still larger one adjoining before the scason opens, doubling the capacity of last year. This has become necessary to accommodate the constantly increasing patronage. Though less easy of access changed their man can, asset of the capacity of last year. This has become necessary to accommodate the constantly increasing patronage. Though less casy of access than most others, once here the sportsman finds it the loveliest of all lakes, with fly-fishing all the season. During the past year a partially new trail was swamped out to Seven Ponds, lessening the distance two miles or more, and with less hill. As in past years, George Huntoon will perform mail service tri-weekly, and haul supplies daily. John A. Burke, Rangeley Lake House; George Oaks, Oguossac House, Rangeley City; H. J. Kimbal, Mountain View House, Rangeley Outlet; I. N. Packard, Camp Kenebago, Indian Rock: Maj. C. T. Richardson, Hains' Landing, at the head; and Capt. Fred C. Barker, Bemis, at the foot of Mooseluemagunic, will manage and control their respective hotels and camps as in past years. Captain Barker at present is in Boston, lecturing—talking, he modestly styles it—before schools and angling asociations, describing and illustrating by diagrams the localities and methods of enjoying sport. Those fortunate enough to visit this region will find all he promises fully verified. His steamers, Oquossac and Mooseluemagunite, will yly as usual. Old-timers will be pleased to learn that Captain C. W. Howard will resume charge of his steamer, Molly-chuncamunk, on the Rangeley peats season.

At the last session of the Maine Legislature an act was passed prohibiting residents from taking certain fish during a portion of the close season for their own use—a privilege heretofore allowed them. So far as can be ascertained, the law has been duly obeyed, though public sentiment is, and for a while longer, no doubt, will be, against it; but eventu-

ally it will be discerned to be in conformity with self-interest, which admonishes us not to kill the goose, etc. It seems quite probable that early in the summer this place and Phillips will have phonographic communication. This accomplished, a greater number of sportsmen will give this region the preference.

RANGELEY, Maine, February, 1889.

NIGHT SPEARING.

NIGHT SPEARING.

A MONG the fine sports of the boys of fifty years ago, that of "night spearing" must be included.

The stream that we frequented was quite wide, but generally shallow, say from six inches to three feet deep, with occasional holes too deep for us to wade. The fish were mostly trout and suckers, but the former were seldom captured, as they never lie close to the bottom, while the latter were often taken in large quantities and frequently of large size. Our parties varied from three to six, each armed with rude spears and grain bag in which to carry his fish. For a light, we at irst used a faggot of pitchpine splinters, four or five inches in diameter, and eight or nine feet long, bound together every foot or so with green bands or wire. Two such torreks were required for a night's spearing, covering about a mile of the stream and occupying about three hours.

In later times we made an improvement in our lights. Necessity is said ever to be the mother of invention, so instead of the cumbersome and unwieldly faggot, we constructed an open work basket of old barrel hoops and wire. This was tied to one end of a long pole and a corn basket to the other, in which a supply of pine knots were carried, and from which the light in the iron basket was kept glowing. This proved a great success, and except when the bearer slipped on a smooth stone and boy and light together disappeared beneath the water, lighted the stream from bank to bank.

We found that a cloudy and moonless night with no wind was the most favorable time for our sport, there being no ripple on the water and the light more searching, so that a fish was readily distinguished from a root or sunken stick. Spearing, like 'bobbing for bullheads,' may not be considered very scientific, but let a greenhorn try it, and if he don't miss his game, it will be because the fish is about as long as his arm and as logy as a sueker.

TROUT FLIES.

TROUT FLIES.

TROUT FLIES.

THE warm weather of the past few days has turned our thoughts towards the trout season. The bluebirds, robins and blackbirds are on in great numbers, English snipe have put in an appearance, and even the peepers have been heard in the marshes.

Thinking that the following items about trout flies are therefore in season I take the liberty of sending the inclosed lists. I have, for convenience, divided the flies into three classes, and, while I know from experience that such lists are not absolutely perfect, I can only say that they are the result of twenty years' lly fishing in our waters, and to a certain extent verified by many other anglers. Class A represents the flies that have proved most killing; class B, those not quite so good, and class C, those that are occasionally good.

Class A.

CLASS A.

Class A.

Coachman, Great Dun, Black, Brown, Red and Ginger Hackles, Cech-y-bon-dhu, Shoemaker, Abbey, Grizly King, Blue Dun, Black Guat, Cow Dung, Red and Dark Fox, Yellow Sally, Ronald Stone, Brown Hen, Dusty Miller, White Miller, Scarlet Ibis.

Queen of the Water, Plum, Grouse and Gray Hackle, Scarlet, Gray and Olive Gnats, Professor Beaverkill, Cahill, Iron Blue Dun, Bright-Pox, Canada, Moutreal, Jungle Cock, Prime Gnat, Cinamon Dun, Jenny Spinner, Gray Coflin, Brown Coflin, Blue Blow.

CLASS C.

Green Hackle, Brown Stone, Golden Spinner, Red Spinner, Raven, Green and Gray Drake, Hawthorne, Hooker, Golden Monkey, Alder, Shad Fly, Sand Fly, Brandreth Wood Duck, Bee.

Best flies for the Adirondacks, Maine and Canada:—
Brandreth, Holberton, Saranac, Rangeley, Moose, Iron Spinner, Canada and Montreal, Abbey, Coachman, White Miller, Jungle Cock, Silver Doctor, the Hackles. W. Holderton.

TROUT IN NEW JERSEY.

TROUT IN NEW JERSEY.

It is not generally known, save by a few Philadelphians and the natives of the locality of which I will make reference, that within fifteen miles of the Quaker City there are, in the vicinity of White Horse, on the Camden and Atlantic Railroad, two or three streams at this writing fairly abounding with trout. Trout Run, the main brook of the three, (the names of the others I have forgotten) is a stream thickly bordered and overgrown with an almost impenetrable labyrinth of alders, blackberry buskes, etc., which in spring time, unless it be very early, renders it impossible to fish with bait even, and never with the fly. The trout caught are small, scarcely ever measuring more than four or five inches, yet I have seen some that would reach six or eight.

five inches, yet I have seen some that would reach six or eight.

Some years ago the existence of trout in these New Jersey brooks was kept a profound secret by those that displayed their catch on their return. I remember at one time offering one dollar apiece for six live trout that would measure six inches each, to be furnished me in good condition in twenty four hours, not thinking I could possibly gotthem, for it was in the month of February. In less than twelve hours, to my great amazement, I had them swimming in my aquarium provided with running water and in full view of the passers by of my store, situated on Chestnut street, near Fourth, in Philadelphia. These fish were taken by Mr. Chas. Vogel from Trout Run while the snow was yet on the ground. They lived until June, when the temperature of the water becoming too high, they one by one died.

I have often seen catches of fifty and seventy-five brought from the stream, but the season in which they were taken was always in late February or early March, and I learned that it required the most active, weazel movement on the part of the angler (if you can call it augling) and a use of rod tip only to find one's way to water enough and room enough where a bait could be dropped. These fish were native trout, the stream had then never been stocked nor the communicating ponds, as I understand, but I was told by a Major Lewis, of Philadelphia, who used to visit the locality often, there are one or two dams situated on Trout Run or one of the neighboring small creeks, where he had at times finer fishing and larger trout could be caught. Trout Run was always reported to me as a terrible place for ruttlesnakes after the, sea-

son had became warmer as it approached May or June, but I do not know how true it was. I remember, though it was only in February, March, and early April, my friends went there. I always fancied, however, it was the greater growth of underbrush, etc., the later season brought forth and not the

snakes.

Of late years February and March fishing at Trout Run is not indulged in, as the law interferes, but I am informed today the same streums are full of trout, and the distance within fifteen miles of Philadelphia: Such fishing I never enjoyed, but it is a fact we have trout so near us.

HOMO.

THE BAIT QUESTION.

THE writer comes to you for information, from you or some of your well-informed correspondents, on "fish-ology." To state the case briefly, we have near us a river which abounds in perch (so we call them; I think they are generally known as "sun perch,") horse fish, white bass, catfish, etc., etc.

The great trouble with us is bait. We use, when we can get them, the tail part of large crawfish which, skinned or peeled, makes a very white nice bait; they are scarce, however, and hard to get. The common earth worm is plentiful enough, but is a poor bait, the fish seeming not to care much for it.

enough, but is a poor bait, the fish seeming not to care much for it.

The stream has a current of two and a half or three miles per hour, too much to fish with a cork or float, and what the writer wants to hear is—what is the best bait to use, and whether to fish at the top of water without any sinker, or to fish near the bottom with a sinker and worms, or some other bait. We have no experience with this, have no trout in this part of the State, and we use about the same old style of bait and fackle that was in use by our fathers and grandfathers.

Can "flies," "lady-bugs," grasshoppers, frogs, and rubber crawfish be used to advantage in our river? Of course I mean such baits as we can buy from the fishing tackle stores, and

crawiish be used to advantage in our river? Of course I mean such baits as we can buy from the fishing tackle stores, and not the natural insects. By answering these questions, together with such other information as would be useful on the subject, you will confer a great favor on a subscriber who is fond of fishing, but finds proper bait hard to get.

We are "up" on guns, dogs, and quall shooting, but far behind the age in the sport of the fisherman. The writer has a small carp pond, and has recently placed in it twenty young earp, procured from the Fish Commission in Washington city. He will be able to report something in that line. In the meantime, he would like to be informed as to what is the best kind of aquatic plant to place in the pond, whether to plant the seeds or bulbs and how best to get a quick growth in the pond, suitable for carp. Can you tell me?

Subscriber.

Subscriber.

Goldsboro', North Carolina.

Goldsboro', North Carolina.

It is very difficult to tell what will be'the best bait for fish in a stream that one has never fished. It is somewhat like prescribing for a patient whom you do not know, when at a distance. The best plan in such cases is actual experiment. We would try minnows, fins of fish and strips from their bellies, white grubs from the fields in spring, and such natural baits as we could get.

Artificial baits are good in some cases, especially when kept in motion to attract the eye of the fish, but they have no odor that is attractive.

We doubt that your fish will rise freely to the fiy. They are mainly mid-water feeders, and the current seems strong enough to spin for the fish. We would advise small trolling spoons, with very small books, and if the current is not sufficient to spin them when held by the rod with twenty to forty feet of line, then the spoon can be cast and trolled. If the spoon sinks with so much line, place a light float-indiway, or where experience proves the best. Perhaps other subscribers can help this one out of his trouble.

In the matter of carp food, the Festuca fluitans is a good water plant, it grows in the ponds at Washington. The conference alled "frog spittle" is excellent.

CHUB FISHING.

CHUB FISHING.

I NOTICED in your issue of February 16 "Ches. A. Peake's" answer to "P. A. B.," concerning chub fishing, locality, etc., and your editorial comments on same.' I agree with you that it is to be deplored that locality should so contribute to the incongruity of the popular nomenclature of fish. In some respects "Ches. A. Peake," although evidently referring to bass, describes the chub, for the chub certainly means business when he bites, which he is never tardy in doing on any fairly favorable day for fishing, and is a spirited, if brief, fighter when hooked.

I have known them in tide water to attain a growth equal to a good-sized shad. Is this too indefinite? Well, then, certainly two pounds and over; but the "giants" that are land-locked about one pound, as you say. I have caught them in every stream I have fished that empties into the Delaware—the Rancocas, Pennypack, Timber, Raccoon, Mantua and Brandywine; also the Octorara, that empties into the Susquehanna. My favorite and, I think, most successful time for fishing for them is from October to March, as their flesh is much finer then, and they will then always bite if there, and not frightened. Of course, I mean if the streams are clear and free from ice.

The bait par excellence—grub worms out of an old apple stump; light line under all circumstances and, if fishing from the bank of a flowing stream, a rather stiff rod—but not too heavy for comfort—that will enable the fisher to lift them out over brier bushes that frequently overhang "likely spots;" a small-sized cork float, that a buckshot will properly balance, regulated in distance from the end of the line as the depth of the fishing "(wery rinch of ground,") you should have your line (linen) well waxed, so as to make it as impervious to

e stream varies. If fishing "

the stream varies.

If fishing "every inch of ground," you should have your line (linen) well waxed, so as to make it as impervious to water as possible and to run through the guides freely; then let your cork float down stream, keeping it about thirty feet ahead of you. Experience alone can teach you when to strike. You can wax your line by either boiling it in, or rubbing beeswax on, and then remove the surplus by pulling it through a rag held in the hand. In shallow water always keep at least thirty feet behind your float, and when you want to fish the "likely spots" with shortened line, approach cautiously. The club are shy about here, and, I fancy, every place else when scarce.

The club are shy about here, and, I fancy, every place else when scarce.

I said that grub worm out of an apple stump is the bait par excellence; but they are as hard to get, if not more so, than the fish, so I have frequently used small blocks of dairy cheese; also the inside of a baker's loaf of bread, moistened and moulded by the hand on the hook. I have caught chub with both of these substitutes for the grub, but have generally been the most successful with them in running water, as the

deception seems to be more readily detected in pools and quiet places.

I forgot to mention that I use a leader from one and a half to three feet in length. This enables your bait, if the current is not too strong, to drag behind your float just the length of the leader. The part of your line under water, from float to sinker, being perpendicular, and as the bait goes down stream bouncing and dragging over the stones on the bottom, it is by this method made very attractive and inviting for the fish. When I have my line in proper condition—i.e., well waxed, so that it will float on the surface of the water from cork to rod. I use a 120z. split-cane rod; but 1 have always felt toward the end of a day's fishing, when the wax has worn off and the line becomes water-soaked, sinking, instead of remaining on the surface, that a stiff rod (natural cane) would be more effective in striking, if not yielding so much pleasure in point of comfort. I have also caught chub with a fly in early spring and late fall in a small trout stream that empties into the Conemaugh River, Pa. When fishing for them in the Octorara Creek we call them "fall fish."

Tuck. PHILADELPHIA, Pa.

BLACK-FISHING ON THE SOUND.

IN my day I have taken a good many blackfish. While there are a good many gamier fish to eatch than the blackfish, or tautog, there's a good deal of eating on them, and not bad eating either, when well cooked, and there's always some sport about catching them, too; and where the choice lies between trout the size of half a lead-pencil, and blackfish of from one to four pounds, I'll go for blackfish every time.

and not bad eating either, when well cooked, and there's always some sport about catching them, too; and where the choice lies between trout the size of half a lead-pencil, and blackfish of from one to four pounds, I'll go for blackfish every time.

A favorite place of mine for getting blackfish is on Long Island Sound near Darien, Conn. A bay sets in there, and back of the bay is an inclosed body of water, with flood gates to open and shut with the tide. Our boat was stowed away at the further side of this pond. In the morning early, my friend Fred, Ryder and I would start in our flat-bottomed seow, pull across the pond, slide the boat over the wall, and after pulling down the bay some distance, would go ashore and dig clams for bait. Sometimes this was the hardest part of our day's work, for, often after digging till we thought we would go through to the other side, we found—no clams; but perseverance brings success. So if we did not get them in one place, we would in another.

I well remember one day we spent there; during the forenoon the tide was not right for fishing, and we got but little, about noon the tide changed, and began to run out. We pulled out to the edge of the Sound, laying about 250 yards from shore, and dropped anchor a short distance from an oyster smack, on which all hands were busy with hand lines, fishing. As we laid aside our ones, and picked up our rods, our neighbors on the smack begun to laugh at "them city fellars fishin' out here with poles," "They won't catch a fish, see if they do," said one. "I'll be they won't," said another.

We said nothing, but got to work; finding it hard to get bottom, we kept putting on more lead, until we had about a pound on each of our lines, and getting the gauge of things, we soon had everything lovely; for the fish seemed to be fairly starving for our bait. First Fred, would reel up one, then I would get one—then they came up, two at a time, just a fast as we could reel them up—all good sized fish, "regular tide runners"—and it was hard work, too;

THE EEL QUESTION.

A paper read before the American Fishcultural Association by Prof. G. Brown Goode.

[CONTINUED.]
HUNT FOR THE MALE EEL AND ITS DISCOVERY BY SYRSKI.

The history of the search for the female of the eel having been given, for the most part, in a translation of the work of Dr. Jacoby, it seems appropriate to quote the same author concerning the search for the made eel, which, though much

concerning the search for the mate cel, which, though much shorter, is none the less interesting.

In the dissertation of Hohnbaum-Hornschuch, published in 1842, the opinion was expressed that certain cells found by the author in the ovaries which differed from the egg cells by their form and contents, should be regarded as the spermary cells of the cel, and that the cel should be regarded as hermaphrolite. Six years later Schluser presented an interesting dissertation upon the sexes of lampreys and eels, in which he pronounced these opinions of Hohnbaum-Hornschuch to be erroncous and expressed the opinion that the male cell must pronounced these opinions of Hohnbaum-Hornschuch to be erroncous, and expressed the opinion that the male eel must be extremely rare, or that it was different, perhaps, from the female. From this time up to the beginning of 1879 a male cel was never seen, nor do we find any opinions expressed concerning the form of the male of the eel or its reproductive

concerning the form of the lane of the early its reproductive Organs."

According to Robins in 1846, George Louis Duvernoy (Couvier Anatomic Comparée, ed. 2, 1848, tome viii, p. 117) described the ruffle-tube type of the testis of the lampreys and eels, with the free margin festooned in lobules, shorter to the right than to the left, like the ovaries, etc. He added: "At the breeding season, we perceive in it an innunerable quantity of granulations, or small spermatic capsules, the rounded form of which has often led to their being confounded with the ovaler, at least as the eels, in which, in reality, these capsules are nearly of the same size as the ovules, but the latter are distinguished by their oval form." The ovular are spherical, and not oval; but the other facts are fundamentally correct. It is also in error that Duvemoy

II Jacoby states that in a paper by Rathle, published in the Archiv fur Naturgeschichte in 1833, he remarked, "I expect soon to be able to say something concerning the male organs of the eet." It would be very interesting to know whether in the papers left by this skillful investigator there may not have been recorded some valuable observations concerning the male eet.

adds (p. 133): "The cels and the lampreys have no deferent

adds (p. 133): "The cels and the lampreys have no deferent canal, any more than an oviduct. Like the ova the semen ruptures the capsuler in which it has collected and diffuses itself in the abdominal cavity, whence it is expelled in the same way as in the ova." But he correctly describes the place of opening of the penbucal canal, the waters, etc. Robin, Comptes Rendus, 1881, p. 383.

By some droll coincidence the University of Bologna, and, soon after, that of Pavia, were again prominent participants in the cel tournament. At the meeting of the Bologna Academy, December 28th, 1871, Prof. G. B. Ercolani read a paper upon the perfect hermaphroditism in the cel.

Fourteen days later Prof. Balsamo Crivelli and L. Maggi read a detailed and elaborate paper upon the "true organs of generation in cels." These investigators, without concerted action, had all at once brought up the celebrated issue of the previous century; this time, however, having specially in view the male organs of the cel, while all were convinced that they had reached a final result by their investigations. The results were certainly very peculiar. In the paper of Ercolani it was claimed that the snake-like folds of fat, which had formerly been noticed near the ovarium, were nothing else than the spermaries of the eel, and that upon the left side of the animal this organ developed into a true testicle, while the one on upon the right side shrank up and became functionless. In the work of Crivelli and Maggi, on the other hand, the folds of fat next to the ovary were also considered to be the male organs of the eel, while the one on the right-hand side of the animal-was considered without any doubt to be the male organs of the eel, while the one on the right-hand side of the animal-was considered without any doubt to be the male organs of the eel, while the one on the right-hand side of the animal-was considered without any doubt to be the male organs of the els, since these strips of fat were universally found in all eels, and always in connection

other concusion than that the cels were complete nermaphrodities.

The male organ of the eel, as described by Ercolani, a also by Crivelli and Maggi, shows how carefully investigations may be expended upon things which are not in the least equivocal, since there was not the slightest trace of structure like that of a spermary. The cells of this body in the lining of the stomach next to the ovary are simply fat cells, with all the characteristic peculiarities, just as they are given in all the manuals of histiology. Prof. Rauber, of Leipsic, has examined these fat cells carefully, and they have also been investigated in many cels by the writer, Dr. Jacoby. Never has anything but fat cells and blood vessels been found in them. The so-called spermatoxoa, described in the work of Maggi and Crivelli, proved to be microscopic fat particles or crystalline bodies, such as are commonly found in facells. ¹²

in them. The so called spermatozoa, described in the work of Maggi and Crivelli, proved to be microscopic fat particles or crystalline bodies, such as are commonly found in fat cells.

In the meantime, at Trieste, the question concerning the male organs of the cel was making a very important advance. Darwin had already expressed the opinion that among nearly all fishes the female was larger than the male. He states that Dr. Gunther has assured him that there was not a single instance among fishes in which the male was naturally larger than the female. This opinion may, perhaps, have induced Dr. Syrski, director of the Museum of Natural History at Trieste, now professor in the University of Lemberg, when he undertook, at the request of the marine officials of Trieste, the determination of the spawning time of the fish which were caught in that region, and was obliged to take up the ed question, to devote his attention especially to the smaller cels. Dr. Hermes, in behalf of Dr. Syrski, profests against this idea, stating, on authority of the latter, that the published opinions of Günther and Darwin were unknown to him prior to the publication of Jacoby's paper. Up to that time every investigator had chosen for investigation the largest and fattest eels, thinking that the largest and oldest specimens must have the most highly developed organs of generation. On Nov. 29, 1873, Syrski found in the second speciman which he investigated—an individual fifteen inches long, which is now preserved in the museum at Trieste—a completely new organ which had never before been seen within the eel by any former investigator, although tens of thousands of eels had been zealously studied. Syrskian organ was found, the well-known collar-and-outf shaped ovary, the female organ of generation, was entirely wanting. It was evident from this that eels were not hermaphrodites. The guestion now arose, is the newly discovered organ in the eel, in its external form as well as inner structure, so different from the ovary that it could be c

HOW TO DISTINGUISH MALE AND FEMALE EELS INTERNAL CHARACTERISTICS—BENECKE AND SYRSKI.

The difference between the organs of sex in the eel are well described by Benecke. The ovaries of the eel are two yellowish or reddish-white elongated organs as broad as one's finger, situated alongside of the backbone, arranged in numerous transverse folds, extending through the entire length of the abdominal cavity. They have no special opening to the outside of the body, and their contents must be discharged

Oiltside of the 1004), and then Concurs have be concursed in a microscopic investigation of fatty tissues it is very easy for the so-called Brownian molecular movements to be mistaken for moving spermatozoa, especially in fishes whose spermatozoa, if not very much magnified, shows only the head and appear like little bodies globular in form.

13 "I commenced my investigations," writes Syrski, "on the 29th November last year (1873), and already in the second eel which I dissected on that day I found the testicles, and therefore a male individual of an eel." I sent in March of the following year (1874) to the Academy of Sciences in Vienna a preliminary communication, which was read at the public session held the 18th April, and printed in the reports of the academy."

at the public session feat use rotal approximation of the academy.

In 1876 Professor Von Siebold found male cels in the Baltic at Wisman although this discovery was not at this time made known to the fact that the beginning of the Atlantic and in the Mediterraneau.

into the, abdominal cavity and must find exit through the very small opening situated behind the anns. These two bodies, on account of their great size, are of course not easily overlooked, but they contain such a great quantity of fatty cells and the eggs imbedded in them are so small and delicate that one might easily believe, even after a superficial microscopic examination, that the whole organ consists only of fat. While the eggs of other fishes measure from one to three millemeters in diameter—and sometimes are much larger—still the eggs in the ovary of the eel have, on an average, a diameter of about one millemeter, and are so closely surrounded by fatty cells with outlines much more strongly marked that it requires great skill to prepare a microscopic skide in which they shall be as plainly visible as they are in the accompanying illustration, in which they are magnified 150 diameters. When a person has a microscope which magnifies only 100 diameters, it is best to put a portion of the ovary in water when dissecting it, in order that the eggs may be easily found. It is much easier to find the eggs in young eels, 7 or 8 inches in length, than in the adult fish, since in the former, although the ovaries and the eggs are smaller, the fat cells have not unde their appearance, and the eggs are, therefore, plainly visible at the first glance through the microscope. The number of eggs is extraordinarily large, amounting to many millions. The eggs of larger size, which sometimes are found in great quantities in eels that have been cut up and have been considered to be eel eggs, have always proved to be the eggs of other fish which they have swallowed, and in the course of cutting them up have been found in the eal's belly. The male cels, which are found only in the sea and in the brackish water, are much smaller than the females, rarely exceeding 15 or 16 inches in length; in them, in the place of the ovaries in the female, are found spermaries, which differ in appearance in the manner heretofore referred to. T

EXTERNAL CHARACTERISTICS. - JACOBY.

The external differences presented by living eels (remarks Jacoby, corresponding to the presence of an ovary and the supposed male organ, are very interesting.

The most important, writes Jacoby, is (1) the difference in the size and length of the animal. Syrski states that the largest eels found by him with the supposed male organ measured about 17 inches, 430mm. I have, however, found specimens with this organ at Trieste and in Comacchio which measured 17 to 19 inches, 450 to 450mm. All the cels which exceeded this size, for instance those which were over 8 feet in length, 1m, many of them growing to the thickness of the arm of a strong man, have been hitherto found to be females. The other recognizable external character in the female are (2) a much broader tip of the snoot in comparison with the small, either attenuated or short and sharply pointed, snoot of the ed with the supposed male organ; also (3) a clearer coloration in the female, usually of a greenish hue on the back, and yellowish or yellow upon the belly, white the others have a deep darkish green, or often a very deep black upon the back and always a more perceptible metallic luster upon the sides (1, once in a while, found eels covered all over with a brownish tint, always possessing the organ of Syrski), usually exhibiting also a white color upon the belly. In addition (4) there is an important external character in the height of the dorsal fins; all females have these fins much higher and broader than the cels of the same size which possesses the supposed male organ. Finally (5) there is a character, which is not always a safe one, in the greater diameter of the eye in the eels with quite small eyes are almost always found to be females; eels with the organs of Syrski usually have comparatively large eyes, yet female eels with quite large eyes are not unusual.

The following proportional measurements, the average results of the study of a great number of eels measured by me, will be of general interest; column a gives the total length of the

According to the distinguishing marks which have been given, special reference having been paid to the height and narrowness of the dorsal fin, much success has been met with in picking out, in the firsh-market of Trieste, the cels which possessed the organ of Syrski; absolute certainty in recognizing them cannot, however, be guaranteed. If one is searching among living cels with no characters in mind with the exception of the first—that of length—he will find in every ten eels, on an average, eight females, and with the carposed male organ; but if the selection is made with a careful reference to all these marks of difference, the proportion changes, and out of every ten examples about eight will be found with the supposed male organ.

For another excellent discussion with figures of the characters of male and female cels, the reader is referred to a translation of an article by S. Th. Cattie, in the Proceedings of the U. S. National Museum, vol. iii, pp. 280–81.

QUESTION AS TO THE VIVIPAROUS NATURE OF EELS.

The discovery of the two sexes has not, however, writes

Benecke, settled the question whether the cel lays eggs or
brings its young alive into the world. There has always been

14 Zoologischer Anzeiger, No 20, p. 133; American Naturalist, vol.

15, p. 123, and Jacoby, p. 44.

a strong disposition to adopt the latter hypothesis, and there a strong disposition to adopt the latter hypothesis, and there are many people at the present day who claim to have been present at the birth of young cels, or to have found a quantity of young cels in adult cels which have been cut open. Frequently ichthyologists hear accounts of occurrences of this kind, and receive specimens of supposed little cels from one to two inches in length, which have been kept alive for several the contract of the kind, and receive specimens of supposed little cels from one to two inches in length, which have been kept alive for several days in a glass of water. These are usually thread worms, Asearis libertae, which live by the hundred in the intestinal cavily of the ecl, and which may be easily distinguished from the cels of the same size by the sharp ends of the body, the absence of fins, of eyes and mouth, and by the sluggishness of their motions. The smallest cels, less than an inch in length, have already the complete form of the adult, and are also transparent, so that with a magnifying glass one may perceive the pulsations of the heart, and see behind it the brownish-red liver; the mouth, the pectoral, dorsal, anal, and candal fins are easily seen, and the black eyes cannot be overlooked. In addition to the intestinal worms, the young of a fish of another family, Zoarces viviparus, have given opportunity to the ignorant for many discoveries; for instance, Dr. Aberhard, in No. 4 of the Gastenlaube for 1874, described and illustrated an "embryo of the ecl," which, in company with about a thousand similar embryos, had been cut out of the belly of an eel. This tolerably good drawing at first sight is seen to represent the embryo of zoarces which is almost ready for birth, since it still possesses a very minute umbilical see. It is very evident that the minute egg of the cel could hardly produce a great embryo with an umbilical see Which exceeds by more than a hundred times in size the whole egg. It is also evident that the imagination of the writer had exagerated the 200 or 300 young in the zoarces to a thousand.

whole egg. It is also evident that the imagination of the writer had exaggerated the 200 or 300 young in the zoarces to a thousand.

HUNT FOR YOUNG EELS.—JACOBY.

As might have been forescen, continues Jacoby, Syrski's discovery drew attention anew to the solution of the cel problem. In the spring and summer of 1877, the German advastrian papers and journals were full of articles and paragraphs upon this subject. Among others the following amouncement made the rounds of the press: "Hitherto, in spite of all efforts, science has not succeeded in discovering the secret of the reproduction of the cel. The German Fischerei Verein in Berlin offers a premium of fifty marks to the person who shall first find a gravid eel which shall be sufficiently developed to enable Prof. Virchow in Berlin to dissipate the doubts concerning the propagation of the cel. Iterr Dallmer, of Schleswig, inspector of fisheries in that province, offered to transmit communications to Berlin, and in 1878, in the January number of the German Fishery Gazette, he published a detailed and very interesting report of his proceedings. He wrote, among other things, that it was quite beyond his expectation that this announcement would have found its way into nearly all the German journals between the Rhine and the Weichsel, and from the Alps to the sca. The number of letters which he received first rejoiced him, then surprised him, finally terrified him, so that at last he was obliged to refuse to attend to the communications. He had learned at Berlin that an equal number of communications from all parts of Germany had been received, sent directly to the address of Prof. Virchow, Objects which professed to be young cels cut out of the parents, but which were really thread worms, were sent to him by dozens; the most incredible stories, usually from women, about great, thick eggs which they had found in cels, were received by him. A witty Berliner communication that theel problem was now happly solved since a lady cel in Berlin had given birth to twins.

BENECKE.

It may be assumed with the greatest safety, writes Benecke, that the cel lays its eggs like most other fish, and that, like the lamprey, it only spawns once and then dies. All the eggs of a female cel show the same degree of maturity, while in the fish which spawn every year, besides the large eggs which are ready to be deposited at the next spawning period, there exist very many of much smaller size, which are destined to mature hereafter, and to be deposited in other years. It is very hard to understand how young cels could find room in the body of their mother if they were retained until fley had gained any considerable size. The cel embryo can live and grow for a very long time supported by the little yolk, but when this is gone it can only obtain food outside of the body of its mother. The following circumstances lead to believe that the spawning of the cel takes place only in the sea: (1) that the male cel is found only in the sea the sea: (1) that the spawning of the certaines place only in the sea or brackish water, while female cel is found only in the sea or brackish water, while female cels yearly undertake a pilgrinage from the inland waters to the sea, a circumstance which has been known since the time of Aristotle, and upon the knowledge of which the principal capture of cels by the use of fixed apparatus is dependent; (2) that the young cels with the greatest regularity ascend from the sea into the rivers and

since the young eels never find their way into land-locked ponds in the course of their wanderings, while eels planted in such isolated bodies of water thrive and grow rapidly but never increase in numbers. Another still more convincing argument is the fact that in lakes which formerly contained many eels, but which, by the crection of impassable weirs, have been cut off from the sea, the supply of eels has diminished, and after a time only scattering individuals, old and

many eels, but which, by the erection of impassable weirs, have been cut off from the sea, the supply of eels has diminished, and after a time only scattering individuals, old and of great size, are taken in them. An instance of this sort occurred in Lake Müskendorf, in West Prussia. If an instance of the reproduction of the eel in fresh water could be found, such occurrences as these would be quite inexplicable. In the upper stretches of long rivers, the migration of the eels begins in April or May, in their lower stretches and shorter streams, later in the season. In all running waters the eel fishery depends upon the downward migrations; the eels press up the streams with occasional halts, renaining here and there for short periods, but always make their way above. They appear to make the most progress during dark nights when the water is troubled and stormy, for at this time they are captured in the greatest numbers. It is probable that after the eels have once returned to the sea, and there deposit their spawn, they never can return into fresh water but remain there to die. A great migration of grown eels in spring or summer has never been reported, and it appears certain that all the female eels which have once found their way to the sea are lost to the fisherman. In No. 8 of the German Fisherei Zeitung for 1878, Dr. Schock published certain statements sent to him by Dr. Jacoby. It is remarked in this paper, among other things, that after the deposition of the spawn, the female cel dies a physiological death, and that occasionally the sea in the neighborhood of the mouths of rivers has been found covered with dead eels whose ovaries were empty. When, where, and by whom this observation

or the spawn, the female cel dies a physiological death, and that occasionally the sea in the neighborhood of the mouths of rivers has been found covered with dead cels whose ovaries were empty. When, where, and by whom this observation was made, and who pronounced upon the empty ovaries in these dead fish is unfortunately not mentioned.

A great number of the eels remain in inland waters while others proceed to the sea, either because their eggs are at this time sufficiently ripe, or perhaps because they are sterile. It would seem probable that the increase in the size of the eggs in the wandering eels begins to be very rapid after August and September, while in the carlier months of the year, in all cels of moderate size, the eggs were at the utmost but about 0.09 in diameter. In September of the same year, I found (as an average of numerous measurements) a diameter of 0.10; in October, 0.16; in November, 0.18 to 0.23, while the eggs showed other characters connected with approaching maturity which earlier in the season were not to seen. All the eels which were captured later—in December and January—part of which came from rivers and harbors, part from the harbor of Putzig (Putziger Wiels) had eggs measuring from 0.09 to 0.09mm, while, very exceptionally, some measured '0.16mm, although among the tish examined were some which measured 8 feet in length.

DO MALE EELS LEAVE THE SEA AND ENTER FRESH WATER.

DO MALE EELS LEAVE THE SEA AND ENTER FRESH WATER. This problem is one of great interest, both to the biologist and fishculturist—it is in fact this one disputed point still remaining to be solved. Upon its solution appear to depend the final decision of the question still so warmly debated both in Europe and America. "Do cels breed in fresh water only, in salt water only, or in both fresh and salt water only, in salt water only, or in both fresh and salt water." As has already been stated, the theory for a long time generally accepted, is that cels are "catadromous," descending to the sea to spawn. The theory is, however, sharply contested by many observers, chief among whom on this side of the Atlantic is the Hon. Robert B. Roosevelt, Presient of the American Fishcultural Association. It appears probable to the writer that the truth lies somewhere between these two extremes, and that it will be hereafter ascertained that the cel, like a majority of other animals, has flexible habits, sometimes deviating from its ordinary custom, which appears to be to spawn in salt or brachial water.

Male cels have been found in the following localities:

1. In 1774 by Syrski, in the fish markets of Trieste; these markets being supplied with cels fram Chroggia on the Adriant, and to a lesser extent from the lagoons of Commachic.

In 1875, on the coasts of France, by Dareste.
In 1875, among specimens of Anguilla marmarala from

India.

4. In 1875, in the Baltic, at Wismar, on the Danish coast,

India,
4. In 1875, in the Baltic, at Wismar, on the Danish coast, by Prof. Von Siebold.
5. In 1877, in the lagoons of Commachio, by Jacoby, Among 1,200 specimens, five per cent, were males; while among these, less than 15 inches in length, 20 per cent, were males. This was in brachial water. (See paragraph XIX.)
6. In 1879, at Trieste, by Dr. Hermes, who found 15 males among 20 cels selected by Dr. Syrski.
7. In 1890, on the Baltic coasts of Denmark, by Dr. Hermes. Out of one lot of 39 from Wismar, he obtained 8 males, thus repeating Von Siebold's observation.
8. In 1880, from the Baltic between Zealand and Saland Denmark. Out of one lot of 36, Dr. Hermes obtained males.

males.

9. In 1880, in France, by Robin.

males.

9. In 1880, in France, by Robin.

10. In 1880, by Cattet.

11. In 1880, by Dr. Hermes, at Cumlosen, on the Elbe, about 120 miles from the German Occan.

12. In 1880, at Rugers on the Baltic, by Dr. Hermes, who found 44¢ per cent. males in one lot of 137.

13. By Dr. Pauly, among cels planted at Hünnigen, in Elsass-Lothringen. See below.

It has been shown by Dr. Pauly that among the very young cels (monté), taken near the mouths of the rivers, is a considerable percentage of males, which, when transplanted to fresh water, will then retain their masculine characters and develop into perfect adult mades. This discovery is, of course, of the utmost importance to fisheulturists, making the attempt to introduce eels into new waters. Its importance has already been pointed out by Director Haack.

The practical lesson to be learned is simply this—that young, for introduction into stringe waters, must be taken from very near the mouths of rivers, in order that both males and females may be secured. The interest to zoologists lies in the fact that Pauly's discovery readers the theory of Von Siebold less plausible, indicating that the sexes of the young cels are differentiated before they begin to mount the rivers, and that the males do not ascend beyond the limits of brackish water.

Dr. Pauly's discovery is so interesting that I propose to

and that the mass to how a second is water.

Dr. Pauly's discovery is so interesting that I propose to trunslate his own account of it. The investigation was made, I believe, in Munich, and the report from which I quote was published in the Austro-Hungarian Pishery Gazette, at Vienna, December 23d, 1880. Dr. Pauly writes: "During the past, year I have received from Court-Fisherman Kuffar a large number of eels, which I have used in my investigations. The

large individuals, all of which came from lakes of northern Italy, were females. I received, however, from the same individual, another lot of cels, consisting of much smaller individuals, weighing from 20 to 90 grains (§ of an once to 3 ounces), also taken in fresh water. At the request of Professor Von Siebold, I had paid particular attention to the sexes of the cels which I was engaged in investigating, and to my great astonishment I found that a large majority of these small cels (19 out of 27) were males; possessing instead of the familiar ovaries, the "lappenagan" described by Dr. Syrski, A histological examination of these organs convinced me that the structure of these tissues agreed with that described by Freud."

ded in the "mountry" as try, and probably at the approach of sexual naturally informed to find the image to the analysis of the sexual naturally informed in the image to the sexual naturally informed in the image to the property of the property of the image to the property of the prope

assaults of Neptune and his hosts, but Old Nep. carried the works by storm, and all but about one hundred feet of the shore end has been washed away by the surf.

STUMERON fishing in the waters around Georgetown, S. C., has become a large and profitable industry. About one hundred men are employed in the business, and large quantities of sturgeon meat are shipped to Charleston in kegs every week.

Keura Lare Club.—A new club has been organized, the objects of which are the stocking of Lake Keuka, N. Y., with fish and protecting them against illegal fishing the stocking, rearing and protecting of game on the borders of the lake, yachting, hunting and fishing. The managers for the first year are: William L. Halsey, Clark Bell, William S. Kimball, Henry F. Huntington, Henry B. Ellwanger, James G. Cutler, Morris F. Shepard, William W. Webb and Eugene T. Curtis. The office of the club and its club houses will be located in the counties of Steuben and Yates, upon the borders of Keuka Lake.

IN THE SENATE.

IN THE SENATE.

THEN up rose Smith of Florida, the best of the delaters,
And spoke about its measure for protecting alligators;
He showed how tourists shoot at them the second for reason.
And asked to have it made a crime to till them to search.
Then Brown he moved amendment by inserting a brief clause
Compelling alligators not to operate their jaws;
But Smith he up and said of him who thought the subject comied,
And Brown, responding briefly, wished to say in this connection
That Smith in guarding reptiles had an eye to self-protection.
Then Smith he flung a volume of the Message and Reports,
And Brown was laid upon the floor a good deal out of sorts.

One Continent.

Misheulture.

Appendix A contains Prof. Ryder's illustrated report, which occupies sixty-four pages, and is followed by that of Master Francis Winslow, the "Bibliography of Literature relating to Oyster Culture". "Notes on some of the early stages of development of the Clam, or Mananose, Mya arcawia, Linu, by John A. Ryder," with plates, to which we must refer readers who wish to follow the subject thoroughly. Appendix B gives the oyster and fish laws of the State; the public, local and general laws of both oysters, fish and terregins. The frontispiece of the report is a fine drawing of a shad, while the plates at the end of the work contain Spanish or bay mackerel, codish, shad, branch herring, made and female, glut herring, autumnal herring, or tailor shad, make and leather carp. This and the previous reports reflect great credit on the Maryland commission, and especially on Maj. Ferguson, who has been immediately interested in following up fishculture in a scientific manner.

CODFISH CULTURE IN NEW YORK.

CODFISH CULTURE IN NEW YORK.

THE work of taking codfish ergs at Fulton market still goes on and has proved to be a success. This enterprise is due to the forethought of Mr. E. G. Blackford, the active fish commissioner of New York, and assistant to the U. S. Fish Commission. Messrs. Sauerholf & Handen take eggs daily and send them to Washington. Over 11,000,000 have already been obtained and forwarded. The best success in transportation has been had by putting the eggs in ordinary glass fruit jurs with sea water and then surrounding the jurs with ice. Prof. Ryder is still working out the embryology of the cod in the rooms of the Pulton Market Fish Mongers' Association, by kindness of the officers, Messrs. Miller, Lamphear and Storer, who have placed them at his disposal. The first two days of the experiment no live milt could be obtained, and consequently the eggs then taken were worthliess, but since that time good milt has been plenty. The size of the cod egg is one-nineteenth of an inch in diameter and it is very transparent, much more so than the eggs of the shad, and Prof. Ryder tells us that the yolk is less in the egg of the cod than in that of the shad. The eggs of the codfish are of less specific gravity than those of the shad, and instead of requiring to be bnoyed by a current of water from below, rather require a current to take them down. The period of hatching varies from fifteen to forty days, according to temperature, and the fish when hatched are not over one-fifth of an inch in length and float belly up for a short time.

There is no doubt that the great number of fish brought to Prulton Market make it a desirable place to obtain eggs, and the success which has followed this attempt will no doubt in-duce Prof. Baird to make it a permanent station. From this point eggs can be obtained in such numbers as may be desired and cod grounds established along the coast. That the cod remain where deposited has been proved at Gloucester, Mass., where the fir remained in the harbor, where planted by the f

FISHCULTURE IN ENGLAND.

FISHCULTURE in ENGLAND.

TISHCULTURE is carried on in America to such an extent and the subject occupies so large and forms so interesting a portion of your paper, that you will be glad to know we are copying your excellent example, although still sailing far in your wake. As will be known to many of your readers, the Marquis of Exeter has twice or thrice sent his fish-breeder to the Delaware River for consignments of young bass, and out of twelve hundred fry brought over in 1879, he succeeded in placing over eight hundred in Whitewater Lake near Stamford, where they have the river well, and are now breeding. In fact we may say that the American black bass has been successfully acclimatized here, and is being offered to fish-culturists at ten shillings a head, and, although the price is high, if introduced into suitable waters, will soon yield profit enough to satisfy the genuine Waltonian in sport, and the public in a new and delicious dish at a season when our salmon and trout are not to be had. Many of our waters are thoroughly neglected and their capabilities of producing immense supplies of delicious, cheap and wholesome food wasted, and, as I believe, there is room for the bass where trout and greyling do not exist I expect to see it increase and multiply in this country, as its character as a sporting fish is proved, for it will increase our angler's delight and lengthen the season of his enjoyment, and in the "Fisher's Garland" is abook generally known among American piscators, but if not, it should be. The edition I possess is edited by Joseph Crawhall, and contains a garland for each year from 1820 to 1804, and many of them really are as described, "right merrie" songs, gladdlening the heart of all true anglers, and indeed old writers claim for angling kinship with poetry. A writer in 1933 says: "As it is said Poeta nascitur non jit so ongot the piscator or fisherman to have a natural inclination unto the art of angling." It may be as well to say the "garlands" referred to costs but a few shillings.

FISHCULTURE IN WYOMING.—In his message, delivered before the Legislature of Wyoming, Jan. 12, Gwernor Hoyt said: The sixth legislature assembly took an important step in the direction of stocking waters needing to be supplied with valuable fish, by providing for the appointment of a commissioner to have charge of experiments looking to that end. The report of the commissioner herewith presented, furnishes gratifying evidence of the success of the experiments already made. The commissioner has demonstrated not only special competency for the work to be done, but likewise great zeal and efficiency in the discharge of his duties, which have been performed without other reward than the satisfaction derived from the success of his labors. It will be observed that he attaches importance to the construction of a hatchery, at a small expense, and the temporary employment of an experienced person to have charge of it. Should it appear, on further inquiry, that we cannot be advantageously supplied from hatcheries in neighboring States, I shall approve this recommendation, believing that he results to the Territory of stocking our streams, as proposed by him, would abundantly justify the expenditure.

A FISHWAY AT ELK RAPIDS.—Regarding the proposed fishway on the Elk River and Elk Rapids, Mich., the Progress says: We have been informed by Messrs. Dexter & Noble that it is their intention to build a fish-ladder in the clutte early in the spring. Some two-years ago one was built for the river, but which no fish but a salmon could ever go up. It is the intention of the firm to put in a ladder that will meet all requirements, and that will be approved by all sportsmen. Mr. John French has a minnow house built, near the clutte and has conveniences for keeping 100,000 of this kind of bait. As soon as the frost leaves the ground he expects to build his beat-house, which will be on Elk River, just above the clutte.

LOESTER CULTURE.—Mr. David Babson, of Gloucester. Mass., proposes to begin the culture of lobstors in Goose Coye Pond, near that place. A question has arisen whether he can properly control the property, which he has leased from the State Fish Commissioners, on account of a claim made by some that it is navigable, and therefore public water.

The Rennel.

PITTSBURGH DOG SHOW.

PITTSBURGH DOG SHOW.

PITTSBURGH, Pa., March 6.—In order to be orthodox we suppose that we may designate this as the "Smoky City." which we find comes natural and easy; but we cannot, as is customary, poke fun at the murky atmosphere we breather and the grimy faces we see; for well we know that beneath the dark canopy over lead clean, bright dollars are being piled up by the industrious inhabitants, and as we see the grimy faces wreathed in smiles of welcome to the stranger, and know that the cordial greeting is from the heart, we have naight but words of praise for the Snocky City and the genial, wholesouled gentlemen who make it their home. Everything looks favorable for a very successful show. Mr. Chas, Lincoln has labored assiduously to make all the arrangements complete, and with his usual success, as everything is running smoothly, even to the minor details.

As will be seen by looking at the list of entries, many of the most prominent dogs of the country will be piesent, as well as quite a number of youngsters who, indeping from their breeding, should make a good showing. There will be sharp competition for the many and valuable special prizes offered, and he winners may well be proud of the result. The magnificent display of these prizes in one of the large show windows of J. Palmer O'Nell & Co. attracts universal attention, and is well worthy an inspection. Although all of them are not exhibited, the display is very time and does infinite credit to the donors. In the other window is displayed an oll painting by Mr. McIntosh. This is exceedingly well executed, and we think it the best and most life-like picture of a dog that we have ever seen.

Mr. J. M. Tracy, of the red Irish setter Biz, owned by Mr. Melhtosh. This is sexeedingly well executed, and we think it the best and most life-like picture of a dog that we have everseen.

In addition to the large list of special prizes, Messrs. Bailey, Banks & Biddle, of Philadelphia, offer a solid silver ladle for the best kennel of sporting dogs owned by one individual. The judge in this class has no easy task, as there are several kennels here that, for purity of breeding and beauty of form, are well worthy of the highest commendation, and the fortunate winner may well feel proud of the high honor achieved in securing this prize. The special for the best kennel of five English setters is also a warm place, as there are no less than five entries, and all of them dirst-class.

The class for Laveracks is exciting considerable attention, and the pick of the best kennels in the country are present to contend for the honor.

The show is held in the old City Hall, which is a capital place, as the room is large and well ventilated. There are three rows of double stalls for the dogs, extending the length of the hall. Owing to the large number of entries there will be no room in the main hall for judging, which will be done in a room up-stairs. The hall is lighted with the electric light, which we should judge will display the animals full as well in the evening as by "ay. The daily papers contain glowing accounts of the wonderful dogs that are to be shown, and there is lots of dog talk on the street corners and by the fire-side, and the exhibition will no doubt be thronged with eager rowds anxious to behold the celebrated animals about whom so much has been said.

Many of the dogs are already here, and the trains to-night will bring the remainder of the entries. A number of sportsment from all parts of the country are he and many more are expected to-night and to-morrow. Among the first to arrive were Mr. D. C. Sanborn, of Dowling, Mich.; Mr. C. T. Armstrong, of New Albany, Ind.; Mr. L. F. G. Berkley and Mr. H. Bail

Hanner, of Cleverand, U.; Mr. E. I. Marten, or Winnington, We shall defer an examination of the dogs until they are put in show condition, as many of them have come a long distance and very much need the scrubbing and rubbing which they are now receiving. Our report next week will contain comments upon the most noteworthy animals, as well as a full list of the awards.

tance and very much need the scrubbing and rubbing which (they are now receiving. Our report next week will contain comments upon the most noteworthy animals, as well as a full list of the awards.

ENTRIES IN SPORTING CLASSES.

Class 1. Champion English Setter Dogs.—B. F. Wilson, Pittsburgh, Spot, (Carlowitz-Lucy). Laverack Romel, New Brighton, Mack Daverack, (Thunder-Peeress). H. B. Class 47.—First, Mr. Full Mr. Workhausen's Waldman III.; second, same owner's Waldren.

Class 47.—First, Mr. Go

A VISIT TO JOHN DAVIDSON.

A full list of the awards, and a detailed account of the show will be published next week.

A VISIT TO JOHN DAVIDSON.

Let me give you some account of a recent visit to one of the points of attraction in the suburbs, the snug little estate of our genial "inutual friend," John Davidson, than whom a more hospitable, whole-hearted, thoroughly straight sportsman is not often found a-leid. I had made a good many en agreements to visit the worthy Scot's plantation, but was compelled, very refuctantly, to cancel them on account of pressure of business, but on Saturday last, John found me with an afternoon at my disposal, and you can readily imagine I fell a willing captive. It was a bright, crisp, clear, sunshiny February day, such a one as ordinarily is seldom seen in Michigan, though they have been abundant during this almost phenomenal winter. We were soon seated in his meat, compact little shooting wagon, behind a pair of sharp little ponies, as neat and compact as the vehicle which they drevy and whirling across the historic River Raisin, over the very ground where, seventy years ago, occurred that massace in which was spilled some of the best blood of Kentneky, and as a foul blot stains the page of history with a crime and treachery which stands were a trifle softened by the ardent rays of old Sol, and might under some circumstances have made the drive somewhat of a "spatterwork picture," but the three niles were traversed before we had time to comment on it, and we drew up at the gate of "Davidson Lodge," where Frankie, a "clip of the old block," relieved us of the ponies, while we averned our fingers and toasted our slims at the hospitable fire indoors.

Of course, the lirst thing to be done, was to inspect the really magnificent kennel, which comprises some of the best stock in America. John has had many fine lots of dogs, but I am confident, as I told him, he has never shown the equal of the present collection of upwards of twenty-five animsis. At any request he brought them out an

ident, as I told him, he has never shown the equal of the present collection of upwards of twenty-five animals. At my request he brought them out and "put them through the motions."

The first brace out were Scottish Chief, a black, white and tan, by Prince of Orange out of Doll; and Prince Charlie, a blue and tan, by Prince of Orange out of Doll; and Prince Charlie, a blue and tan, by Afton onto f Doll. The first-named is a magnificant looking doy, with the speed and style of a thoroughized of the highest class, and his owner's favorice of his keanel. The latter is a very pretty little animal, also a very speedy and wide ranger. The second brace were nearly white, whose snowy coat was gendly flecked as with rain-frops, and were Johnie Faa, by Rob Roy out of Doll, and Swan, by Druid out of Lady Cypress.

The next brace were Abbey, a white, black and tan, by Afton out of Faunie: and Nellie Grey, a blue belton, by Afton out of the file animal is frince of Orange, orange and white, imported, a winner of second prize at the Alexandra Palace Show, London. Benledi, a white and lemon, by MacLeod of Dare out of Lelia.

Ned, a red Irish setter of Plunkitt stock, is a good one, in worthy company of Glendyle, a white black and tan by Rob Roy out of Doll, and a brace of white and black puppies by Johnie Faa out of Ailsa, were as likely progeny as one would wish to see. Next came the matrons of the kennel: Alisa, imported in utroe, and inported Doll, who retains her youth and viçor in a remarkable degree, not looking a day over three years old. I also took a great fancy to a handsome fox-terrier, and a regular beauty of a beagle, which comprise the kennel.

Let it not be supposed, either, that John Davidson's taste for breeding line animals extends alone to dogs, for a glance about the farm will convince you that the reverse is true, for his Southdown sheep are of the highest quality, his cattle above the average, a good way, while in the stable will be found as good looking a young trotter as almost anybody owns "in these

the necessary facilities. I hope such a meeting can be alranged.

Before leaving John's little home I had the pleasure of inspecting his numerous valuable trophics captured at the various bench shows, embracing costly cups, needals, etc., and a very remarkable sporting library, manly of English authors, including "The Druid," "Hieover," etc. After a chat in the little parlor and a "stirrup cup," we turned the noses of that little blacks toward the city again, and were spinning along the road back to the "Floral City." I am going to send you a "reminiscence" soon.

Monroe, Mich.

DOG AILMENTS-CAUSE AND CURE.

DOG AILMENTS—CAUSE AND CURE.

THE following, from the Bagman, we commend to our readers, and trust that they will not only read, but heed, the valuable advice it contains:

Among the great uumber of queries addressed to our several departments dealing with domestic animals, and with dogs in particular, a large percentage, referring to the different ailments, ask "What is the cause?"

It is a very natural and proper question, but we are quite sure very few of those who ask it have any proper conception of the difficulty of answering in a large majority of cases.

We do not in the slightest object to the question; it is a wholesome reminder to us of how very little we know, and should stimulate the cultivation in a healthy form of that virtus which Uriah Heep paraded as his specially distinguishing quality. We do object, however, to such questions—and we receive many of them—as, "My dog has a bad cough. What is the cause of it and how am I to cure him?"

Evidently such writers consider that we are grifted with some mystic power of divining the causes p o lucing symptoms which they do not deem it necessary even t, describe; but we lay no claim to magical art, and, therefore, take this opportunity of asking our correspondents to be a fittle more considerate, and better serve themselves by giving details of how their animals are affected when they seek our advice. Any departure from the normal state of health or ordinary habits must be plain to those who take an interest in and observe their animals at all closely, and it is only by stating these deviations from health fully and clearly that advice other than mere guesswork can be given. Diagnosing and prescribing by letter without an examination of the patient is at all times difficult, and when only one bare and isolated fact is stated it generally becomes impossible.

In regard to cough, it is an evidence of disease, which may be slight or serious. Coughs differ greatly, and the sort of cough often indicates the character and seat of the disease. Then, again, alt

opinions.
Unfortunately, in the present state of science, there are many diseases, the causes of which are hidden from us; but these are being diligently investigated and will surely be discovered, and with increased knowledge freer scope will be given to the practice of preventive medicine.

ENTRIES FOR THE NATIONAL DERBY.

ENTRIES FOR THE NATIONAL DERBY.

WE have received from Mr. D. Bryson, the sceretary of the National American Kennel Club, the following entries to the National Derby, made since his last report to us: Countess Magnet, (Count Noble-Spark) liver and white, English setter bitch, owned by D. C. Sanborne, Dowling, Mich., July 13, 81.

Unknown, (Tory-Meg Meriles) black, white and tan, English setter bitch, owned by J. J. Snellengburg, New Brighton, Pa., May 16, 81,

Minnie Lee, (Bismark-Nellie) black and wite, English setter bitch, owned by M. F. Rodgers, New Albany, Miss., Sept. 22, 81.

22, '81. Dashing Elcho, (Elcho-Noreen) red Irish setter dog, owned by C. Spahr, Ridgeville, Pa., nine months. Royal Victor, (Racket-Kelp) lemon belton, English setter dog, owned by J. M. Taylor, Lexington, Ky., April 15, 81.

OUR ENGLISH LETTER.

OUR ENGLISH LETTER.

In the doggy world things are rather quiet at present. The old established Wolverhampton show could not be called a success, the general quality being poor; Liverpool, the same week, was altogether good—no such dog show in that neighborhood for a dozen years.

I hear from Devonshire, from whence has come so many of our best pointers, that in the several leading kennels some very promising youngsters are coming on, bidding fair to take the place of the old Devon cracks Bang, Wagg, Bow Bells, Fan, etc., etc. Mr. S. Price's Climax had last year a litter of beauties to Mr. Statter's Pux. Mr. Norrish has two forward lots out of his Fursdon Juno and his Fan by Bonus and Sancho (mother to Bow Bells) and his bitch Beryl (closely related to the nonparell Wagg) has recently thrown a fine litter to Wippell's Bonnec II. Beryl, while carrying these pups, won second prize at Birmingham, and first prize and "breeder's prize" at Alexandra. Palace in December last. Mr. Wippell las a fine lot; some of last March by Bang II. are fine grown dogs with lots of quality.

As much interest appears to be taken at present in spaniels in America, an excellent opportunity occurs for securing good stock, as Mr. Arthur H. Easten is breaking up his kennels and disposing of the whole lot. These spaniels are Dr. W. Boulton's well-known blacks, a strain established by that excellent pampliel. "Breeding for Color." There are only a few of these, all of high quality and great purity; three of them are worth a special notice because of their super excellence. Baronet, by Beverly Bob, ex-Champion Bona, sister to the famous Brush, born July, 1850, a great winner. I consider Baronet the best headed spaniel being shown. His sire, Beverley Bob, by Clampion Brush, ex-Belle, is another one invaluable for stock. He won at London, Darlington, Everther Bob, by Clampion Brush, ex-Relle, is another one invaluable for stock. He won at London, Darlington, a truly wonderful career, for in black spaniels we have always some keen competition.

Loxon, England, Feb. 4.

LACTATION.—Princeton, N. J.—Editor Forest and Stream Since I have been a subscriber of your valuable paper, never once have I seen an account of an incident similar to the one happening in my kennels; I therefore take the liberty of writing to you, and of asking you if the following occurrence is not something unusual in the cannie line, indeed, if it is not a most ship unusual in the cannie line, indeed, if it is not a most ship unusual in the pointer bitch. I have two bitches; my oldest, a fine pointer bitch. I had bred last summer, and she had nine puppies. At the usual time the mother, Dutchess, commenced weaning them. Now comes the funny part. No sooner had their mother forbidden them to approach near her than these little mother forbidden them to approach near her than these little mother forbidden them to approach near her than these little frojans, was at last forced to succumb, and weary laid down at their mercy. This siege was kept up in the most active manner, and in a few days poor Jolie, with her sides all scratched, became a new mother to the pointer puppies. Had Ibeen home no such forment would ever have happened to her. But imagine my surprise when I entered my kennel door, atter some months' absence, to find my puppies suckling my young setter, not much more than a puppy herself. There she lay upon the clean straw, much enlarged and actually giving mik to her foster children. I had her immediately separated from them, and now not a sign of swelling is seen

on Jolie, and the puppies are rapidly growing. Please tell me if you know of a similar case. Jolie gave milk for two weeks. —THEO. A. GLL.—[This occurrence, although very singular, is not at all rare, as we have published similar instances.]

MR. J. O. DONNER'S English setter bitch is very sick with pneumonia. She may possibly recover, as everything is be-ing done for her that experience can suggest, but the result is, to say the least, doubtful.

A TIMELY INQUIRY.—If one dog can be placed on a scent, how many dogs can be placed on a trade dollar?—New York Mail and Express. We know of several that could readily be "placed" providing our neighbor had the dollar to trade.

LOST.—Mr. Fred. A. Taft, of Dedham, Mass., writes that his setter dog has strayed or been stolen. He is six years old and weighs about lifty-five pounds. His color is dark red (almost liver), and white ticked on nose. Any one knowing of his whereabouts will confer a favor and receive a suitable reward by communicating with Mr. Taft.

THE ESSEX COUNTY HUNT will open the season next week under a new mastership, Mr. Henry Munn, the late master, having retired in favor of the son of Judge Knapp, of Hackensack. Mr. Knapp will take up his residence at the Kennel Club House at West Orange, N. J., and will hunt the hounds twice a week during the hunting season.

THE NEW YORK DOG SHOW.—The entries for the New York Bench Show are coming in much better than at any previous show, and the indications are that they will outnumber those of any show ever held in this country. Mr. Lincoln, who is now in Pittsburgh superintending the show now being held there, writes that nearly all of the exhibition there will also be at New York, and that he is confident from the many letters and inquiries that he is receiving, that the number and value of the dogs that will be exhibited here will surpass anything of the kind that the world has ever seen.

For Sale—Belle, by Rodman's Dash, ex-E. N. Shorb's imported Nellic. Belle is pure red, with the small white spot on breast and feet, marked exactly like the old dog. As I am situated it is impossible for me to keep Belle. She has never had a litter, and I think she will be in season soon. No fancy price, as I am not in the business. Messus, Glubher, West, Robertson and Judge Pratt, of Brooklyn, now is your chance to get the old stock. Write soon. Mr. Il. S. Rodman will guarantee Belle's pedigree. G. H. Wild, Red Rank, N. J.—Adv.

Pachting and Canoeing.

THE YAWL IN AMERICA.

[CONTINUED.]

THE history of the yawl in America is this. In the year 1849, Captain Harrison, now Commodore of the San Francisco Y. C., brought to that city a small yawl on a ship's deck from England. Owing to our semi-barbarous revenue laws and tariffs and red tape,

finding no necessity for any such contrivances, sail being shortened by taking it off her piece-meal, as required. Although out for weeks at a time, no trouble was experienced in sworking ship in all kinds of weather, with only casual assistance from Mrs. Yale at the helm while the owner himself went forward to scure anchor or holst the jib. As the Endi is a craft of historic fame, and goe deep naticulars will not be out of place, premising to our Eastern readers that the area of her sails is, of course, smaller than customary with us in our lighter winds.

Length over all	31 ft.
Length on deck	3) ft.
Length on load line	27 ft.
Beam extreme	10 ft.
Depth amidships	4 ft.
Least freeboard	1 ft. 10 in.
Greatest draft to heel	2 ft. 10 in.
Draft with board	7 ft.
Length of board	8 ft.
Displacement	61% tons.
Displacement Ballast, iron inside	31% tons.
Mainmast, deck to hounds	23 ft. 3 in.
Topmast, cap to shoulder	8 ft.
Masthead	3 ft.
Boom.	18 ft. 10 in.
Gaff.	10 ft. 6 in.
Mizzen, deck to hounds	20 ft.
Mizzen boom	13 ft.
Bowsprit outboard	7 ft.
Jibboom, cap to stay	5 ft. 3 in.
Mast from end load line	7 ft. 2 in.
Mizzenmast abaft sternpost.	5 in.
Rake to mainmast	1 in. 6.
Rake to mizzenmast	1 in, 51/6.
Steve to bowsprit	1 ft.
Steve to bowsprit	4 ft.
Topsail vard.	8 ft.
Area four lower sails.	620 sq. ft.
Area mainsail	300 sq. ft.
Area jib	142 sq. ft.
Area mizzen	102 sq. ft.

Area inizzen. 162 sq. ft.

From the foregoing it will be seen that under jib and mizzen Enid spreads rather more than one-third the area of her lower cauvax, and under mainsail and jib a little over two-thirds, so that sail could be reduced about one-third at a time without resorting that the could be reduced about one-third at a time without resorting that the pean built with a view to stowage rather than very high speed. She had fair dead rise, slow, able blige, no flare above, and easy, parabolic water lines, showing a trace of hollow below. The fore foot was well rounded up, and the yeach had a seasonable drag for a centreboard boat. Her overhang aft was elliptic in shape, the sheer just right for appearances and taking head seas, and her clipper stem one of the neatest in mold on the Pacific coast. Throughout she exhibits the hand of an expert, and all her points seem to have been well considered and planned in a way much above the average "talent" prevailed. The frame is of oak, sawed: likewise the keel, post and deadwood, and the skin of Oregon pine, secured with a galvanized fasten as the proper of the parabolic properties of the properti

wood, and the skin of Oregon pine, secured with galvanized fasteniers.

A year after her appearance Commodore Harrison came out with a fine, large yawl, known as the Frolic. Her sail plan at first included a narrow jib and a lug mizzen. After trial, however, more bowsprit was given and a gaff adopted, and under that rig we believe Frolic has since been in commission. Being a deep, able boat she became a favorite among the ladies, and for all round work one of the best in the fleet, while in point of outliers, and for all round work one of the best in the fleet, while in point of outliers, and for all round work one of the best in the fleet, while in point of outliers, and for all round work one of the best in the fleet, while in point of outliers, and the same and keep she is yacht up to the highest standard in all respects. Frolic has probably logged more miles and days of cruising than any other yacht in Amierica. Indeed, in the activity her owner displays and the avidity with which he follows up a life allock, the Commodore need acknowledge no superior at home or abroad. His example is one many an

ENID-Mr. C. G. Yale, S. F. Y. C.-The First Cabin Yawl in America.

ENID—Mr. C. G. Yale, S. F. Y. C.—T
he was not permitted to use her in our waters. In 1855 he built a
small open boat in San Francisco, and sailed her as a yacht with the
yawl rig. At that time there were no yachts on the Pacific, and in
factbut one clubin the country, the N. Y. Y. C., with but a score or so
of vessels in its fleet. The influence of Com. Harrison's little boat
was therefore not felt in subsequent years, yet to him belongs the
next attempt to apply the rig on the Pacific owes its origin to Mir.
"Will" Brooks of San Francisco. About the year 1868 he built a 17ft.
decked boat called the Petrel, which he supplied with a leg of mutton
main and mizzen or "driver," as our friends in California have since
christened the after sail. So satisfactory was the experiment, that a
few years later he built a larger boat, the Swecheart, upon the same
lidea. After passing out of his hands she was changed to a sloop in
threatened to invade yachting circles in San Francisco. The sloop
capsized on the bar outside the Golden Gate, in true New York style,
and drowned her crew of two hands. The really modern yawl yacht
was first devised by Mr. C. G. Yale, the present secretary of the S. F.
Y. C. About 1871 he built a regular cabin yacht 39ft. long, and acting
partly upon the advice of Capt. Edwin Moody, well-known as an experienced sailor, the yawl rig was adiopted. Capt. Moody drew the
the Dnid, falled to make a two able impression, as she was too sangly
riegged to show well in the races on the Bay. Her Bernudian or Jibheaded mainsail was materially increased by the addition of a raff
with the cloths running diagonally to those of the old half of the sail.
To counterbalance this increase, a small flying jib was set to a boom
run out ahead of the regular standing bowsprit. A 12ft, housing topmast and square-headed topsail, increased by the addition of a raff
with the cloths running diagonally to those of the old half of the sail.
To counterbalance this increase, a small flying jib was set to a boom
run out ahead

Eastern nabob with time heavy upon his hands might follow with advantage and benefit to himself and the sailing community. In general appearance Frolic is like the illustration to be found in our last week's Issue. In their Commodore and in their flagslip he San Francisco Y. C. may take just pride, for in no respect are they surpretentions perhaps, and here too mage our flagslips may be more pretentions perhaps, and here too mage our flagslips has be more sunk, but for an outfit such as a sallor would, demand as the prime necessity for favorable comment and indorsement, and for the live interest displayed in the club's affairs, or for the ever ready manner in which Frolic turns out in the lead upon all occasions and cruises the whole year round, our Eastern men can show no parallel, and we will have to lower our flag to our more spirited brethren of the Pacific.

The jib and mizzen nearly equal the mainsail in area, which seems to be very good propertions for San Francisco yachts. Under mainsail alone or under jib and mizzen about half lower sail would be shown. The fawn provud a fast boat under the new arrangement, and though easily beaten as a shoop by the Frolic, she turned the tables upon the latter as a yawk, and then handsomely disposed of the New York sloop Chara, who, by the way, was also beaten by the Frolic, both yawks making good weather of it when the committee as yawks more stiffness is attained, the sail being kept lower down, Not only is this the experience in San Francisco. Our also here in the East, we have the same thing. Since several notable victories of the earlier yawks over shoop, our friends on the Pacific have ceased disparaging remarks about their being "comfortable but slow" and one after another the sloops have failed in with the times, shed their big booms and come out in improved form with the handier rig, until a fortal time. That the yawl would prove quite as fast as the big for the solops of the side of the sloop is well high extinct on the Pacific, while the formal time. That the yawl would prove quite as fast as the big mainsail in the lighter winds of our Eastern waters we are not prepared to myintain, but that in anything, from a good working breeze up, the loss due to her givill disappear, we have good reason to believe. Once let there be wind enough and to spare to transmit its work to the sails and the yawl will give quite as fast, sifter, handier and far safet fithm the shoop, and for these casons the rig is emidded to favorward and reasonable speel, with easy work and efficiency to wind ward and reasonable speel, with easy work and efficiency to wind ward and reasonable speel, with easy work and efficiency to wind ward and reasonable speel, with easy work and efficiency to wind ward and reasonable speel, with easy work and efficiency to wind ward and reasonable speel

A TYPICAL BOURBON.

WE derive much amusement from the frantic efforts a turf contemporary occasionally makes to gain for itself the reputation of a critic. Something must be said, of course, upon the typics Fortest and there is the way our contemporary blunders and staggers along under its heavy four contemporary blunders and staggers along under its heavy four contemporary blunders and staggers along under its heavy four contemporary blunders and staggers along under its heavy four contemporary blunders and staggers along under its heavy four contemporary blunders and staggers along the said that the property of the worst particular than the said of the worst particular particular than the science variety of the more than the worst particular than the science variety of the Herald and the sciences, the property is given to the worst with beautiful formule, and running them out crants, like as they turn dog into sansage.

Away, therefore, with science, the profundity of which old age can no longer grasp! the feels reheved; the perplexing complications of the multiplication table, the worsying intricacies of the foor tule will no longer ras to disturb his peaceful slumbers. The world owes such a genius a monument with long, green cars.

But this astonishing discovery was too much for his balance, for he mext runs et all the particular than the continuous particular that accepting stability as the standard particular than the standard property of
iong before Prospero was ever thought of, and years before her advent numerous yachts had first been laid down on the drawing board even in America.

The reporter's knowledge of the eutter appears to be based upon what little he has seen of the Madge. Anything with more beam is to him no longer a cutter, yet nine retails of the British enter lete thave greater beam, ranging from four shal a built down to three beams to him no longer a cutter, yet nine retails of the British enter lete thave greater beam, ranging from four shal a built down to three beams to had been to the standy Lloyd's Bestrier, a standard publication of which had be his study Lloyd's Bestrier, a standard publication of which has probably never heard, but which will enlighten lime considerably.

From the same Indictous source we learn that a certain 60ft, schooner is "too small to amount to nuch," our contemporary's hisghit into the qualities and worth of a yacht being limited to gauging ner value by tonnage. Little yachts, no good, hig yachts, heapy good. Such is the sum and substance of its creed. No doubt our contemporary buys oil paintings by the square yard and pays for brication by the point.

Arrow, 61.8 ft, water line, and Gazela, 72ft, and the perpotur's curiosity to know what the result would be? Can we he astonished that he had heard nothing of ten new entters in hand for this season. That he heard nothing of ten new entters in hand for this season. That he heard nothing of ten new entters in hand for this season. That he heard nothing of ten new enters in hand for this season. That he heard nothing of ten new enters in hand for this season. That he heard nothing of ten new enters in hand for this season. That he heard nothing of ten new enters in hand for this season. That he heard mother of the death of the processity about boats weighted in that way being no one dreams of handes with every ounce of lead wet by salt water was quick as a ent and nimble as a squirre right under his nose, when no one dreams of handes with every ounc

his swagger in print, and protect of mechanical aptitude or technical Yet this seribe, without a trace of mechanical aptitude or technical proficiency, not even in sympathy with the sport, a most superficial observer, slip-shod in his reasoning, a slonely logician, a timeserver, a turn-coat, and a pirate or our columns, thuse stupid thrusts and slang at Forest and Stream and the London Field! Verily, it is broad forms.

AN ENGLISH OPINION.

Editor Forest and Stream:

I was pleased and begatened in my own esteem to find favorable comments in your journal on that which I felt moved to write during the past year on the burning question of yacht measurement. It is much to be regretted that the English V. R. A. consents to move only men to many grove, setting its heel on justice, economy and many elements of comfort in yacht racing.

All sizes and varieties of craft are gradually and helplesely sucked and the setting of the producing legislation, and all, in defance of the Association's type producing legislation, and all, in defance of the Association's type producing legislation, and all, in defance of the Association's type producing legislation, and all, in defance of the Association's type producing legislation, and all, in defance of the Association's type producing legislation, and all, in defance of the Association's type producing legislation, and all, in defance of the Association's type and control to be a standard to the association of the Association's type and control to be form. A dull monotony, compared with what might be, is the natural result.

Lozical recollection of how best to do it—favoring no one special form—should be the method of proceeding on both sides of the "point," in places of a marrow straining after a creditless local prodounties be formed to be a supposed to the producing
ATLANTIC YACHT CLUB.

ATLANTIC YACHT CLUB.

Editor Forest and Stream:

The Atlantic Yacht Club appealed from the judgment rendered against it by William T. Lee, the Secretary of the Brooklyn Yacht Club, for \$794.5, November 22, 1880, and the Supreme Court has served the judgment and holds that Frank H. Stott after he had signed tile subscription paper to pay the \$500 toward improving the land of the club having expended, the money few was one of the land to the club having expended, the money few was one of the land to convey to the plaintiff any right there is back, and that he could not convey to the plaintiff any right therefore the land by the plaintiff in this action, and the judgment should be reversed. Barnard, Gilbert and Dyckman, judges.

EAST RIVER YACHT CLUB.—New measurement rule takes load line length only, the mean length rule having been found wanting insmuch as it is a fallacious estimate of size. The club learned this by the appearance of a square-sterned cubin boat in the facet. Evidently, it does not take much to convince those directly interested, of the truth it does not take much to convince those directly interested, of the truth leaves to take much to convince those directly interested, of the truth leaves to take much to convince those directly interested, of the truth leaves to take much to convince those directly interested, of the truth leaves to take the proposed to an expression of size, the club found no fault. As soon as one member, smarter than the rest, brings out a bigger boat than usual under that rule, the club is not slow to see its fallacy and abuishes it for load line length upon the grounds that such a system will more nearly class the boat according to actual size. This is rather a rough commentary upon the recent verhaustive investigation? By the anatura committee of the Lordon of the committee's line of argument, the East River Y. C. d. was not so of the committee's line of argument, the East River Y. C. d. was not so of the committee's line of argument, the East River Y. C. d. was not so of the committee's line of argument, the East River Y. C. d. was not so of the committee's line of argument, the East River Y. C. d. was not the committee's line of argument, the East River Y. C. d. was not the committee's line of argument, the East River Y. C. d. was not the committee's line of argument, the East River Y. C. d. was not the committee's line of argument, the East River Y. C. d. was not the committee's line of argument, the East River Y. C. d. was not the committee's line of argument, the East River Y. C. d. was not the committee's line of argument in the Seawanhaka Yacht Chub, held at behande of mensurement. It consists of length on water line, with one-fifth of the overlang added; this to be multiplied by nine-

LARCHMONT YACHT CLUB.—At the last meeting the following gouldeneen were elected members: Theodore Bartow, George A. Thayer, H. Herbert Logans, and S. Thayer, R. Berdell, F. Worth White, W. L. Stow, J. C. Cooley, J. B. Milley, Daniel Cook, William Feet, W. E. Roosevelt, George Taylor, Henry C. Ward, Horato N. Harper and Warren B. Smillt. The new measurement rule, adding one third overhang to load line for length, and giving time on Atlantic X. C. scale was adopted.

NEW YORK YACHT CLUB.—We are glad to see that at last an effort is to be rade to change the shape of thig officers permants. That distinguishing flags should be discernable by their shape as well as distinguishing flags should be discernable by their shape as well as distinguishing flags should be discernable by their shape as well as divice the club takes one morrose colums, and in acting upon our advice the club takes one morrose columns, and in acting upon our advice the club takes one morrose schoms, and in acting upon our advice the club takes one morrose speciates by their shape as well as the state of the st

several yachts.

"MALTA CROSS"—Is a new publication devoted to transient yachting interests on the Island of Malta, where many British and foreign yachts call during their Meditermana cruising. Subscription \$1.50, to be sent to M. A. M. Mizzi, 409 Strand, London Bluct has been elected corresponding secretary. The regard committee is as follows: Walter Gülbert, Wm. Hardman, Jr., Josse Vandegrift, Geo. Bosier and O. F. Kern. Spring matches fixed for May 29.

Answers to Correspondents.

J. W. P., Jersey, O.—A letter directed in our care will be forwarded to the party.

M. E. B., Willet, N. Y.-You can obtain the cartridges from New York dealers.

Bifle and Tray Shooting.

FOREST AND STREAM TOURNAMENT

FOR THE SHORT-RANGE CHAMPIONSHIP OF 1892.

FOR THE SHORT-BANCE CHAMPIONSHIP OF 1882.

FIRST prize to be ten monogram medula, presented by the Forest and STREAM and Ron axis dive. Second prize, 50 per cent. of cutrate fees; third prize, 10 per cent. of cutrate fees; third prize, 10 per cent. of cutrate fees; third prize, 10 per cent. of conditions—Tenus—Each team shall consist of ten men. The teams participating must be composed of members of the various clubs which they represent. Ritles—Limited to ten pounds in weight; minimum pull of trigger, three pounds; 22-100 cal. Tenus may turnish their own ritles and ammunition, or use those at the gallery, as they may desire. Number of shots—Ten by each competitor. Sighting shots—Two shots will be allowed each competitor. Fosting—Ori-hand. Targets—Mygard targets, according to the regulation—Ori-hand. Targets—Mygard targets, according to the regulation—Ori-hand. Targets—Mygard targets, according to the regulation—Ori-hand. Targets—Shygard targets, according to the regulation—Ori-hand targets—The according to the contest carried on during the winter of 1870 under the direction of this paper.

A meeting of the captains of the various teams to decide where the match shall be shot, and to make the necessary arrangements, will be have no voice in the meeting. It is also necessary that the number of competing teams should be known then, that the preliminaries may be arrunged accordingly.

THE INTERNATIONAL MATCH.

THE INTERNATIONAL MATCH.

A SPECIAL meeting of the Board of Directors of the National Riflo Association of America was held at No. 20 Nassau street, on the arterion of klarical and competitive with the following members present: Generals and Cowperlaveit & with the following members present: Generals and Cowperlaveit & Major Schermerbern and Mr. Seabury. General Molineux, the President, announced that the meeting had been called to consider very important matters in regard to the proposed international rifle match. General Wingate, he said, had a surprise for the members in the shape of messages from England stating that, although the English riflemen were unable to guarantee a return match in case the American tean should go there, they were willing to take General Wingate then read the letters and cable dispatches which have lately passed between himself and Sir Henry Halford bearing on the subject as follows:

on the subject as follows:

"NATIONAL RIPLE ASSOCIATION, 1
No. 12 PALL MALL, Feb. 14, 1882. ;

"Dear General Wisgate—We have received your letter following upon your telegram saying that the terms we propose for the International Military March are agreeable to your association, provided we take standing position at 20 yards and guarantee a return match in 1883. We have also received a telegram asking us to waive the rule as to proof marks.

"Dear General A Wishard—we have received your letter following; upon your relegram saying that the terms we propose for the international Military States are agreeable to your association, provided we should be a seen as the second of the propose of the international Military States are agreeable to your association, provided we should be seen as the proof marks.

"I am directed to tell you that we are quite willing to give way to your wishes upon both the first and last questions, but for the second, the guarantee of a return match in 183, we are unable to pledge ourselves. Our invitation to you was prompted by a desire to comply with the wish expressed by you and other American riflemen, that there should be a match at Wimbledon during the present year, and there should be a match at Wimbledon during the present year, and there should be a match at Wimbledon during the present year, and there should be a match at Wimbledon during the present year, and there should be a match at Wimbledon during the present year, and there should be a match at Wimbledon during the present year, and there is with this object that we assent to the standing position at 200 yards, which we are aware is a concession to your advantage. The committee of which I am Chairman have referred the question of a return match to the Council of the National Rifle Association, who find it perfectly imposible to give the desired guarantee. This condition is now the only point at issue between us, and we trust that our inability to give way about it will not be considered by you sufficiently important to preclude our leaving the match at Wimbledon this year. We propose that the two terms shall fire at the same burt with each other, and that three targets—a target to every four men—shall be added to cach team. It is our custom in military breech loader competitions for two men to fire alternately at the same target, the next two men taking their places when they have completed their seven shots each. Would you prefer this order of firing, or for t

Windard, Rifle Association, New York:
Council willing to send team to Creedmoor this year upon terms already airanged.

After reading these communications General Wingate stated that the Committee on the International Rifle Match recommended that a dispatch be at once sent to England accepting the offer of Sir Henry Halford. A resolution to that effect was passed, and the following dispatch was sent to England:

dispatch was sent to England:

Six Henry St. J. Halfond, Rifle Association, London:

Terms accepted. Match to be in September.

(Signed) Windare.

The directors then discussed the best means of selecting a team for the match. It was proposed to invite all these of selecting a team for the match. It was proposed to invite all these of selecting a team for the match. It was proposed to invite all the States to compete for the home to get up such a popular interest as will result in the production and the team was finally referred to the Commuter of Selecting a suit able team was finally referred to the Commuter of Selecting as under the selecting of the best of the Commuter of Selecting as under the commuter of Selecting as under the committee is to act "by and with the active and consent of" the directors, and the matter will be thoroughly discussed before any plan is adopted.

the committee is to act—by and whit the advice and consent of the directors and the matter will be thoroughly discussed before any plan is at a mostling of the N. R. A. last Theoday evening, it was provided that a committee of tive shall be appointed by the floared of Directors to entry out the programme. Each State or Territory, including the District of Columbia, desting representation on the team shall establish competitions at such place, or places, as its military authorities may prescribe for competitors to represent it. The competitions are to be open only to members of its uniformed Militia who have been members shots by cach competitor at each of the ranges of have been members shots by cach competitor at each of the ranges of the second stage. Any unilitary breech-loading rile may be used. The position in shooting will be standing at 200 yards; prone at 500 and 500 yards, and any at the other ranges. No sighting-shots are to be allowed and no cleaning is to be permitted between the ranges. Competitors in these connects who make at least 85 in the first and 67 in the second stages will be deemed qualified to enter the regular on Thestary. We intended "Thursday and Friday," Alay, 16, 4, and 18, At their conclusion 14 competitors shall be selected in the order of Their aggregave scores made in the four competitions, beginning with the hightest in the list of competitors. The committee are movement and in the competitions. The settlem and practice, committee are to select a Capitain. The latter may appoint an Adjustic committee are to select a contain. The latter may appoint an Adjustic constitute the team. Each person entering the final competitions at Creedmoor will be required to present a certificate from the

Adjutant-General of his State stating that he has been a member of the National Guard since Sept. 1, 1881, and is a proper person to represent his State. He shall also sign an agreement to conform to the conditions prescribed for the selection of the team. Persons authorized to participate in the final competions for the selection of the team shall be allowed the free use of the range at Creedmoor for practice two weeks previous to the competitions. The association will provide quarters and subsistence on the range for the competitiors in the four final competions, and for the team and reserves after their four dual competions. The association will provide quarters and subsistence on the range for the competitions in the four final competions. For many the provided part who there were the competition of the four that competition and the state of the state of the National Rifle Association on or before Aug. I by such states as propose to be represented in the competitions. Where no competition is held by any particular State, any persons in such State who shall make the requisite scores and shall have them certified by officers of the National Guard of that State, will be permitted to enter the final competitions at Creedmoor.

The committee of five for the selection of the team consists of Gen. The committee of five for the selection of the team consists of Gen. Sect., and Col. H. S. K. Smith, Col. J. G. Story, Col. Scott, and Col. H. S. S

PISTOL RECORDS.

PISTOL RECORDS.

THE efforts of the Fordst and Stream to show what can be done with the pistol as a weapon of precision, and the publication of several letters detailing experiences with the popular little firearm. has brought many other letters detailing similar notes of shooting done. From these we select several for print. The suggestion of one correspondent that some note should be taken of the percentage of failure is a good one. By striking an average between the hits and misses some notion may be formed as to the average ability of the average revolve and pistol, and this is what we are most anxious to utterly valueless for alming and hitting purposes, and of cone every time they are fired with ball cartridge something is hit, but to aim at an object with them is a pretty sure way not to hit it. Correspondents in writing of shooting done should be careful to say precisely with what weepon and with what ammunition the firing was performed.

ents in writing of shooting done should be careful to say precisely with what weapon and with what ammunition the firing was performed.

I notice in your valuable paper of Feb. 16 remarks on pistol shooting by "Pusil," I would like to inquire if he kept a memorandum of all the shoots he fired. I do not wish to be understood as doubting his statements. I agree with him that a person would be surprised at what can be done by practice with a good pistol, and I also think that "Fusil" was as much surprised as any one when he made the shots he tells of, else, why make memoranda of them? I remember when a small boy of having a cast-iron pistol without any sights on it, and of killing a len upwards of eighty yards, but I have a faint rememberance of shooting a large quantity of ammunition away and not be of shots he missed at the same or closer range.—S. S. W., (Osborn Hollow, N. Y.).

The perusal of "Fusil's" communication recomming his evertainly remarkable record of pistol shooting calls to mind some of my own experience. I did not preserve the dates, but give you the substance. The weapon I used it making the following shots was a Col'rs revolver, 22-eal, 36, harried, I dinhis, I. Hit a silver three-cent piece first time, distance 15tt. 2. Shot a single blackbird from the top of an oak tree, estimated distance 70ts, 3. Shot a robin on the ground, distance 40tt. 4. Shot a piece of paper 2in, by 3, held between the thumb and finger of a friend, distance 35tt. 5. Shot a robin through the head 50tt. distances. 6. Shot a red squirrel from an oak tree while a stiff esternal was bloyed by 10 to 30tt. This may not be as remarkable a score as "Fusil's," but comparing the weapons, approximately good.—B. W. S., (Bay City, Mich.).

I have been watching your comms closely concerning the work of pistol shots. Being once familiar with the twenpon I will tall your

—B. W. S., (Bay City, Mich.).

I have been watching your commus closely concerning the work of pistol shots. Being once familiar with that weapon I will tell you what I saw a gentleman in this city do several years ago with a Smilh & Wesson large sized Russian model. At a distance of 3 lyds, he put fifty-one consecutive shots in a 6m, target. Now, remember this was performed with a regular army weapon and regulation ammunition. This she shooter did not consider remarkable shooting. He still lives here and can perform the feat any day when called on.—B., (Pcoria, Ill.).

III.)

I saw in my last week's copy of Forest and Stream, and in fact have seen for the past month, scores of pistol shooting, and want to know what arm is used by persons making those remarkable scores I have tried with many different revolvers, and even with my owr cannot approach the poorest shobs in the matches you notice. I have a Smith & Wesson "Se-ent. Is not this too large a ball to enable me to shoot with accurately? If you can give me any light as to the best revolver for accurate shooting, with size of ball, etc., you will greatly oblige—S. B. P., (Little Falls, N. Y.).

obige.—S. B. P., (Little Fails, N. Y.).

"BYRNE'S" MAN.—Editor Forest and Stream: In the Forest and Stream of Feb. 23, "Byrne," of Crockett's Bluff, Ark, (if the gentleman's name had been given I would have written directly to him makes several statements that are very hard for a ritheman to swallow, "Byrne" believes that it is within the possibilities for a man to place ten consecutive shots offland with a rite, seventy-five yards, that could all be covered by a saucer, and that there may be a few men that can do it or even do better, but he has not been so fortunate as to see one shoot that could do it, even with a dead rest. A set of the consecutive shots of the same amount from him, at any time and place that he choses, and agree to place ten consecutive shots offland at fifty yards, in a space that will be covered by a sancer. Also ten consecutive shots from rest at 100 yards in four hich circle. In my failingt od ot his he takes the ple.—E. E. Suttru. (he Sucur. Minn.)

NEW YORK RIFLE CLUB.—On Thursday evening, March 2, the

rest at 100 yards in four inch circle. In my failingt od ot his he takes the pile.—R. E. SMTH. (Le Sueur, Minn.)

NEW YORK RIFLE CLUBE.—On Thursday evening, March 2, the New York Rifle Club gave a reception at their handsome club rooms on Fourth avenue, and took this occasion to distribute the prizes in the Surprise match shot during the month of February. The conditions of this match were only five shots instead of ten, and the scores of the best ten targets to count. Highest possible score, 250 points, of the best ten targets to count. Highest possible score, 250 points, which was a state of the best ten targets to count. Highest possible score, 250 points, which was a state of the best ten targets to count. Highest possible score, 250 points, 250 po

by, and were then pleusanity amused the balance of the evening with a varied musical and literary entertainment.

NEW YORK SCHUTZEN CORPS.—The annual calieo ball of the New York Schutzen Corps occurred on Wednesday evening, March 1st, at Germania Hall, this city. Although the weather was unproplitious, a large number of people gathered to "trip the light faintaste" and enjoy themselves. The guests were received by Capt. If. D. Busch, each of the company of the property of the company of the c

CREEDMOOR.—A two-days spring meeting will be held during the irst week in June. The practice upon the range has opened quite ively, and much interest is felt at the prospect of the approaching aternational match.

ALBANY, March 2.-"Six hundred yards off hand," was the rally

BOSTON, March 4,—The few riflemen who visited Walnut Hill to-day found it almost impossible to make satisfactory scores on account of the strong north gale that prevailed all day. Out of four matches down for competition but one tilled, and the scores made in that are given below: Creedmoor Match.

Loomis. C Adams (Mil)... Anson... H Max T Paine.

WELLINGTON, March 3.—The Raymond Club held its regular shoot day. There was present a large number of shooters and quite a

WELLINGTON, March 3.—The Raymond Club held its regular shoot to-day. There was present a large number of shooters and quite a number of spectators. The following is the result of the sweeps and number of spectators. The following is the result of the sweeps and the state of the sweeps and the state of the sweeps and the state of the sweeps. The following is the result of the sweeps and the sweeps and thomas, second; Loring and Jones, third. Third sweep—Loring and Curris, second; Loring and Jones, third. GUNPOWDER!

Dupont's Rifle, Sporting and Blasting Power. THE MOST POPULAR POWDER IN USE!

THE alGST POPULAR POWDER IN USE!
DUPONT'S (A.SET YDER MILLS, established in 1802, have maintained as "great reputation for seventy-eight years. Manufacture the following celebrated brands of powder:
Dupont's Diamond Grain.—Nos. 1 (coarse) to 4 (fine) unequaled in strength, quickness and cleanliness; adapted for glass-ball and pigeon shooting. Facked in 1 lb. camisters. Nos. 1 (coarse) to cfine): burns slowly, strong and very clean; great penetration, with a close pattern; adapted for glass-ball, pigeon, duck and other shooting, with cither nuzzle or breach loaders. Packed in 1 lb. and 5 lb. camisters and 6½ and 12½ [b. kegs.
Dupont's Choke Bore.—Specially adapted for "Choke Bore" (funs, and particularly for prairie and upland shooting. Burns slowly, strong and moist, does not cake or burn on the barrels, gives and upland shooting. Burns slowly, strong and moist, does not cake or burn on the barrels, gives found well adapted for glass-shall spattern; will be canisters.
Dupont's Eagle Rife.—A quick, strong and

canisters.

Dupont's Eagle Riffe.—A quick, strong and clean powder, of very fine grain, for pistol shooting Packed in 1 lb. canisters and 64 hb. kegs.

Dupont's Riffe Fg. "Sea-Shooting,"—FFg. and FFFg. The Fg. for long-range rifle shooting, the FFg. and FFFg. for general use, burning strong and moist. Packed in ½ lb., 1 lb. and 5 lb. canisters, 6½, 12½ and 25 lb. kegs. Fg. coarse, FFFg. fine.

strong and money can strong and money can steen, strong and money can steen, style, 12% and 35 lb. kegs. Fg. coarse, fine.

Dupont's Sporting, Mining, Shippine and Blasting Powders of all sizes and descriptions. Special Grades for Export. Also Rille, Cartridge, Muster Cannon, Mortar, Mammoth, Hexagonal, Cubical and Pellei Powder, U. S. Government Standard.

Powder manufactured to order of any required grain or prof. all the cities and principal town throughout the United States. Represented by

PREPARATIONS FOR THE MATCH.

EVERYTHING is now screne where but recently there was a very troubled atmosphere in the matter of the preliminary arrangements for the international match. On this side the water the committee have sent out the programme on which they propose to proceed in selecting the team. It is but a general scheme of selection, and it is a good one, and any really good military shot may rest assured that he can win his way by merit to a place on the team. It would be an honor which any American soldier may well give time and labor to merit, and, whether the score be high or low, a well-made effort will be duly appreciated by the public at large. There is no reason now why the least obstacle should be allowed to interfere with the harmony which prevails. With open, above-board work the committee of five will find a disposition to support them on every side; but with the manifestation of any disposition to bestow favoritism and secure any undue advantage for any person, to the possible prejudice of the interests and prospects of the team, they may be sure of some lively talk, if nothing more. Across the ocean Sir Henry Halford, who seems to be

carrying the entire weight and burden of the preparations upon his shoulders, is stirring up the popular feeling toward the match and, at the same time, uttering cautions that the match is not to be a walk-over for his team when selected. In a letter written for publication during the past week he says: "It may now, therefore, be considered as settled that a match will take place at Creedmoor in 1882, and at Wimbledon in 1883. The committee calls upon the foremost shots among volunteers to practice with special reference to par-ticipating in this contest." He adds that nothing short of the best work of the best men the country can produce will insure

success for the British.

It is well not to be over sanguine, and Sir Henry is very careful not to raise any false hopes. The match is meeting with general approval, and the chronic British grumbler, who rushes into letters to the editor on every imaginable topic, does not seem as yet to have found a peg on which to hang his lucubrations. The volunteers are individually anxious to secure the honor of being selected as one of the team for America, and the press is giving the matter an earnest support. In its last issue, the Volunteer Service Gazette, for nearly a score of years the organ of the volunteer movement in

Great Britain, says of the coming contest: "We may now confidently hope that an international military shooting match will become an event, if not of yearly, at least of frequent occurrence. The great ingenuity and energy of the Americans give hope that it will lead to great improvements in military rifles and team shooting."

THE SWANTON BATS

WITH the ordinary phenomena of hibernation as exhibited in many of our modern animals we are all more or less familiar. The long winter sleep of the bear and his kinsman, the raccoon, and of the woodchuck, or ground hog, not to mention the more complete form of hibernation of reptiles in northern climates, are facts familiar to every schoolboy. Among mammals, however, the torpor is subject to interruption at times, by a rise of temperature, which does not seem to affect the more profound sleep of reptiles and batrachians.

How long it is possible for a hibernating mammal to sustain its existence beyond that portion of the year which it usually passes in this quiescent state, has been a question which has engaged the attention of many a naturalist, but which has remained unsolved until now. Discoveries have recently been made in the State of Maryland, which illuminate this subject with a flood of clear light, and suggest possibilities in regard to hibernation, hitherto unthought of.

The editor of the Lonaconing (Md.) Valley Times gives an account of the discovery of a pair of antediluvian bats in a coal mine, from which the following facts are extracted. "Mr. Anthony Reese, a miner employed in the Swanton mine, near Barton, Allegany county, Md., dislodged what appeared to be a piece of petrified wood in a seam of coal, 1,000 feet from the opening of the mine and 250 feet below the surface. In the presence of two other miners it was discovered that the find was a pair of bats and that they were They sip water, but do not seem to be able to devour food, and most of the time are in a torpid condition. They are quickly roused when handled, and one of them bit Mr. Reese's finger till it bled. The discovery was made on the 16th ult., and the bats are still alive. One escaped while Mr. Reese was taking it home, but, strange to say, it was found again in the mine near where originally discovered."

This is certainly a most wonderful discovery; so remarkable, indeed, that many people might question whether it had ever taken place had it not been vouched for by an editor. We are relieved from all speculation as to how the bats reached their position in the solid coal by the editor's theory, which, we are proud to say, accords exactly with our own ideas on the subject. "This theory is that the bats were passing the season of hibernation in the hollow of some decayed tree, perhaps thousands of years ago, when a convulsion of nature buried the tree in the depths of the earth. The coal development came, the tree became a part of the coal stratifi-cation, the bark a petrifaction, and the sleeping bats were caged in a living tomb. But what saved the bats from perishing? They did not need air, they did not need food; they were waiting in a torpid state peculiar to their species and adapted to their nature for a season that never came to them. The subtle influences of nature that touched them with life at the approach of spring were cut off, and their state of somnolency continued without interruption. The organism that can retain life three months without sustenance or respiration ought, if the surrounding conditions are the same, to retain the vital spark three years; then why not three thousand? Decay was arrested because, with these creatures, constituted as they are, their entombment was simply an indefinite prolongation of their season of hibernation.

Here we may, perhaps, be allowed to say that the editor's modesty in claiming only a few thousand years for the Swanton bats, however creditable it may be to his caution, and to the truly scientific spirit in which he is pursuing his investigations, must not be allowed to hamper the mind in its consideration of the wonderful power of an animal to live so long without air or food. We find from the records of the Swanton coal mine that its foundations were laid 14,492,-This was the age of the "steamboat lump. The contract for the mine called for certain specified layers of "stove," "egg," and "chestnut," to be in position and ready for excavation in 4,000,000 years thereafter, under penalty of a heavy forfeiture for each additional 50,000 years after the date specified. As we find no record of any failure to fulfil the contract, we may assume that the work was completed according to its terms, and accepted, and hence that the bats must have been in the dwelling from which they have just been released something over 10,000,000 years prisonment these bats were no doubt pterodactyles, or else the immediate progenitors of that interesting group. As the process of evolution was going on above ground and the unimprisoned reptiles were developing into birds, and so on up to mammals, the Swanton bats felt that they could not afford to be left behind in the race toward perfection, and that it was incumbent on them to keep up with the progress of events. So, very naturally, in the spring of 1882, Mr. Reese finds that they have transformed themselves into something so very like the ordinary bat of to-day that to the casual eye there is no difference perceptible. Had the editor carefully examined the matrix which held them, it is not impossible that he might have seen in it the imprint of a hitherto unknown species of pterodactyle.

Hibernation among mammals rarely covers more than a few months, although we have met cases in our own experience where it lasted much longer, in fact, for many years. One of these we remember especially well. Joe Jefferson, whom we believe to belong to the class Mammalia, once slept twenty years, while playing Rip Van Winkle, and we can bring hundreds of living witnesses, who saw it when we did, to prove our words. Epimenides, the Greek poet, went Mr. Jefferson a few better, for he took a nap of fifty-seven years, while the seven sleepers of Ephesus "straddled the blind," so to speak, by dozing away 230 years. These last were mammals also, although boys. Their case is interesting as presenting another point of similarity to that of the Swanton bats, for they, too, did their sleeping in a cave,

The Swanton bats in their Carboniferous days squabbled with antediluvian monsters in dispute over their food, and dwelt in caves and hollow trees in company with Dendrerpe ton, Baphetes and Archegosaurus, forming a happy family, not second to that of the "the greatest show on earth." In the twilight of early morning they circled over the steaming pools chasing the swift-winged and beautiful Miamia, Blattina and Haplophlebium, which there abounded, and dodging the teeth of the ganoids and selachians that were ever ready to take a rise at them, while the gosaurus and all the rest of the saurus family looked on at the wild romp with kindly interest. Later in the day, when the tropic sun poured down with fervid heat, and no breeze ruffled the surface of the water or stirred the straight, pale foliage of the tall lepidodendrids, calamites, and tree ferns, the Swanton bats hung themselves up on the cliffs and comfortably dozed away the time until the cool of the evening, when they recom-menced their flight. Then the Carboniferous boy, if there had been one, might have thrown up his hat, and as the Pre-pterodactyles flapped by on leathery wings, entreated them in the language of his time:

"Bat, bat, fly into my hat, And I'll give you a pound of candle fat."

About this time, our heroes-if we may be allowed this term-entered the hollow tree of our friend, the editor of the Valley Times, to take a short nap of a few months, when the contractors for the Swanton mine took their lodging house for a support to be used in timbering up the mine while the coal was being dumped in, and here the tree with its slumbering occupants was carelessly left. The poor creatures, snugly cuddled up inside, were never told anything about the matter, and never saw the light until the sixteenth of last

Such appears to have been the history of the Swanton bats, tole living relics of Carboniferous Time. We stand before them with bared heads and awestruck minds as we contemplate the changes that have passed over our globe since they were first hatched near the borders of what is now the Swan-

We cannot allude to the many interesting features of this discovery, but one point is worthy of special mention. This is the survival, in the small bat discovered, of the ferocity of the primitive Palæozoic monster. It is stated that one of the animals bit Mr. Reese's finger until it bled! It is shocking to contemplate what might have happened if Mr. Reese had made his find earlier, during the Cretaceous period, for example, when the bats were probably pterodactyles, with a spread of wing of not less than twenty-five feet. Had they been disturbed then, probably the sole evidences of their release would have been a pool of blood, a miner's hat, a candle and a pick. We congratulate Mr. Reese on his escape.

The Swanton bats, as sleepers, have certainly achieved a success, and so far as yet heard from, they are fairly entitled to the cake, the whole of it and any crumbs that may be scattered about. They are, in the language of the ''literary fellar," facile principes, and to use the not less expressive vernacular of the street boy, "they take the rag off the bush." They missed some few years of fun ten million years ago, but at the very shortest calculation. At the time of their im lif they had enjoyed it then, they could not now, so on the

whole we are inclined to think their privations balanced by their present joys. They will have to learn to dodge telegraph wires, which could hardly have existed in their day, although this is mere conjecture on our part, since we came to this planet at a later period.

We extend a cordial welcome to the Swanton bats, and hope that they will enjoy the nineteenth century as much as they did the age which they first knew, and if they should happen to come down our way this summer, they will find the windows open and plenty of crackers and cheese on the dish.

ANOTHER DEATH TRAP.

TIME and again has Forest and Stream raised its voice of warning, and innumerable have been our words of caution against going to sea in beamy, light-draft vessels. They are not fit for aught but duck-puddle play, and if sent to sea the penalty of ignorance or foolhardy recklessness is sure to be paid in the end. A hideous, misshapen slab of a thing called Eva, and by the unsophisticated accepted as a "yacht" (save the mark!), has gone the way of all such rattle trap shams. One of the widest and flattest of tubs ever Launched in obedience to whittle-jack inanity and hearsay theory, this thing has met the fate that awaits scores of other such traps as soon as they venture to poke their noses outside habitually. The Eva was begotten in ignorance, sailed in ignorance and ignominiously sunk in consequence, to keep company with the rapidly growing list of contemptible endings which are disgraceful to the intelligence of yacht builders in America.

There was no need of building the Eva so flat and shallow She was not intended to navigate some specially shoal bay, for, with her board down, she drew no less than twelve or thirteen feet, and from her size, seventy odd tons, she sliould have been fit to cruise around the world in perfect safety. She was built as she is, in obsequious deference to the romance current among most of our builders that fast yachts must, in defiance of all physical laws, sail "over the water," and not through it. The most casual investigation, the most superficial observations in actual practice refute the stupid vagaries which gave birth to such a conception as this flat iron Eva, and it is nothing short of shameful to builders and owners alike that they have so long been content to pass from mouth to mouth a lot of mythical, meaningless, pointless and wholly unsubstantiated claptrap as the acme of successful design, when every-day experience gives to the nonsensical stuff about speed being dependent upon light draft the lie direct. Yet thousands upon thousands of dollars have been invested—sunk, literally sunk—and reputations have been lost by the score, through blindly following ignorance so gross and such palpable humbug, that words fail us to express in full the scorn that should follow the clumsy bucolics responsible for the currency given to the unlikely fabrications concerning the requirements for speed. Not even the wildest flights of spiritualism nor the loosest nursery yarns of ghosts and goblins can equal, in improbability, in downright impossibility, the utter baselessness of the light draft quackery to which a constantly increasing number of deluded victims are being offered in sacrifice.

The Eva was a schooner, the slabbiest kind of a slab, worse than the abominable sandbag caricatures we see hottom up by the score every year. She is 73ft, over all, bottom up by the score every year. 66ft, water line, 22.4ft, beam, and 5ft. Sin, in depth of hold, with not as much as an ounce of ballast outside to preserve the balance between such a light weight hull and the usual towering spars, the use of which the reckless verdancy of the times explicitly demands. This thing has been up and down the coast several times before. Once she struck a reefing breeze and a trifling sea. Then, in the wild antics all slabs go through under such conditions, through the ceaseless efforts to stand on head and tail all in one second, the jumping-jack of a thing tossed her skipper over the quarter like a rubber ball high up into the air, and down he shot like the stick of a rocket, head first into the sea to appear no more. Now the "yacht" has followed suit. She was bound from Norfolk via Ocracoke to Jacksonville, Florida, but dropped herself on the Charleston bar. Fortunately all of crew, lucky dogs they were, found a passing schooner to take them aboard in time. There lies this Eva thing in the sands, the fish swimming in and out and the crabs poking round down below among edibles and fancy drinks in the steward's silent domain, reflectively wondering, no doubt, what an ass mortal man can be to send such a treacherous make-believe trap to sea, when, had common sense held sway, the slab would never have left the blocks her keel was first laid upon.

And now, how many more such productions of "the talent" are there in the fleet? What yacht is to be the next, the untimely close of whose career we will have to record in these columns. Who are to be the next victims to the sickly balderdash about light draft and speed? Will builders learn anything at all? Can we hope that the Madge has been more effectual in driving into unwilling eraniums the egregious folly of their ways than all the hard knocks they have received from Forest and STREAM?

For, mark our words, as we go cruising and lengthen our voyages, disasters without cause will follow in each others' wake, and a frightful roll of deaths will be called at the end of the season if light draft yachts persist in going to sea. Mohawk, Sophia, Eva and others have but opened the chap-Let us hope with the light shed abroad by Forest and STREAM that common sense will prevail through acquisition

rather than that we must wait till desolated homes and lost treasure at the bottom of the sea force conviction against the obstreperous stupidity and inexcusable culpability of builders grasping after the shadow of light draft instead of the substance of good, safe form, wholesome weights and proper

Light draft has no connection whatever with speed.

Light draft yachts may be fast, but so are boats of the deepst draft yet attempted.

Light draft yachts may make a passage without much ado, but once let a trap meet an adverse condition of wind and wave and nothing else but a miraculous intervention of Providence or dumb fool's luck will bring the slab out of the mess without serious harm.

Owners of traps may secure partial safety at least by plastering lead on the keels of their machines. They can secure entire immunity from drowning by burning up the libels upon sound design which disfigure our waters by the squadron, and make so many of our yachts the butt of ridicule among sailors and intelligent men.

LOCAL CLUBS.

HE first step toward fish and game protection is the enactment of laws for that purpose. But this alone will not bring about the desired result. The laws must be enforced; which will not be done unless some one makes it his business to see that they are. It is an old and true adage that "what is everybody's business is nobody's business," and if the enforcement of the game laws is left to individuals, in ninety-nine cases out of a hundred there will be no attempt made to prosecute the most flagrant violations of them; and in the hundredth case, a man honestly endeavoring to bring the poacher to justice, only brings upon himself the ill will of all the poachers, and gets no backing from those who, if it could be done without any effort on their part, would rather prefer to have protection effective.

In the States where there are not trusty game constables appointed, the only effectual means of having the laws carried out is in the organized effort of the friends of protection. With lamentably few exceptions, of which that of Michigan is a shining example, the State associations have proved very inefficient They expend their energies on pigeon shooting tournaments and around dinners, and seem to quite forget the object which they are supposed to have in view. For the most part, the influential members of these associations are rich men, who can hire all the ground they wish for shooting over, or can make journeys of hundreds of miles to where game is plenty. At any rate, for one reason or another, most of the State associations amount to next to nothing for game and fish protection. It seems, then, as individuals can do so little, and large bodies will do so little, that the main hope of efficient protection is in the formation of Every sportsman in a township is interested in local clubs. the preservation of its game and fish, and has some oversight of its woods and waters. There cannot be much illegal shooting and fishing in his neighborhood without his knowing it, and with a dozen or even a half dozen earnest men to help one another, it can soon be stopped. Let it be known in a township that there are a dozen residents united in the determination to put a stop to shooting and fishing out of season, and the poachers will quit their evil deeds, or practice them so seldom as to do but little harm. The expenses of such a club need not be at all burdensome. In most places a room for meeting can be had rent free; the town house, a school house, or the house of a member. An occasional notice in the local paper setting forth the purpose of the club to prosecute all offenders will cost but little, and not much more a hundred printed copies of the constitution and by-laws, one for each member to keep, and a few for him to distribute where they will do most good. There need be no expensive shooting matches, nor annual feasts in part; for the legitimate work of the club they might better be left out. Now and then it may be thought best to hire a trusty man to watch a stream or piece of woodland for a few days, but often this can be done by members without any severe tax on their time, each taking a day in turn. Counting everything, after the club gets fairly started, the levy on each member need not exceed fifty cents a year.

Regular meetings, for the election of officers and the transaction of necessary business, need not be held more than twice a year, though, of course, the oftener they are held the more the interest will be kept up, and they may be made interesting and instructive by essays on and discussions of subjects with which the sportsman and naturalist is concerned. The good work that might be accomplished by only two or three such organizations in every county, is incalculable, and there is hardly a township in the land but has at least its half dozen sportsmen, or men whom, though rarely fishing or hunting, grieve to see our woods and waters made desolate. Let such unite at once for the preservation of the fish and game we have left.

THE DESTRUCTION OF LARGE GAME.—In our Game Bag and Gun columns this week will be found an important contribution to this discussion. Its writer has had unusual opportunities to secure accurate information on this subject by personal observation. In the same connection we print the bill introduced at Washington by Mr. Post, and referred to the Committee on Territories. It is extremely doubtful if it ever comes out from that committee unless Mr, Post can

overcome the apathy which has in the past defeated all like attempts to secure national legislation on this important matter. In our next issue we will present a review of the buffalo legislation at Washington during the past ten years.

PROPOSED DOG LAW FOR NEW YORK STATE.

HE following is the text of section first of the proposed new legislation concerning dogs, and for the protection of sheep:

Section 1. Every owner or keeper of a dog shall annually, on or before the thirty-first day of May, cause it to be registered, numbered, described and licensed for one year from the first day of the ensuing June, in the office of the clerk of city or town wherein said dog is kept, and shall cause it to wear around its neck a collar distinctly marked with its owner's name and its registered number, and shall pay for such license two dollars. Provision is made whereby the owners of poultry, sheep or other domestic animals killed by dogs can recover their value. Section 13 provides that all puppies when eight weeks old shall be considered dogs. This is ridiculous, and should be changed to four months at least, as many puppies die soon after weaning. We presume that dog owners throughout the State are perfectly willing that a law of this kind should be passed, but a tax of one dollar per capita would be amply sufficient to provide funds for the payment of all losses that may occur, and still leave a large surplus for the treasury of each county,

THE PITTSBURG BENCH SHOW Was a superior exhibition of fine sporting dogs, better than those which preceded it. There has been, indeed, since the inauguration of such exhibitions, a wonderful improvement in the standard of fine dogs shown on the bench in America. Competition is closer than ever before, and the prize winners of a bench show now are sure to be a first-class lot. One most satisfactory and encouraging sign of the times, is the fact that many of the field trial winners are also coming to the front as bench show winners. The breeders have very happily hit upon the plan of combining bench show form with field qualities, and the result is taking away all their arguments from the carpers at bench shows and field trials.

NEW YORK Dog Show .- Everything looks very promising for the New York show; entries are coming in from all parts of the country. Hundreds of applications for entry blanks have been received from parties who have never be fore exhibited, showing that there is an increased interest being taken in dog matters. Major J. M. Taylor, of Lexington, Ky., who so acceptably judged here last year, will judge the Irish and Black and Tan Setters. Mr. James Watson, of this city, will judge the Mastiffs, St. Bernards, Berghunds, Newfoundlands, and Dachshunds. This completes the list of judges, and we congratulate the Westminster Club upon having secured the services of so capable and fair-minded gentlemen.

RIFLE TOURNAMENT .- As will be seen by reference to our rifle columns, the preliminaries of the Forest and Stream gallery rifle tournament have been arranged, and the series of matches will soon be inaugurated. A comparison of the scores made in the coming tournament with those recorded in the last Forest and Stream competition will give an interesting test of the progress made in this kind of shooting in the interval which has clapsed.

THE ADIRONDACK PARK.—Ex-Gov. Alvord has submitted bill at Albany which provides that 600,000 acres of the Adirondack region be set apart for a preserve, to be known as the Adirondack Forest, and to be used by the public for hunting and fishing purposes.

LIVE CANVAS BACKS WANTED .- We are requested to inquire if any of our readers can tell how and where one or more living pairs of canvas back ducks can be obtained. We shall be greatly obliged to anyone who can give us the desired information.

A CONVENTION of members of the New York State Association for the Protection of Fish and Game met at Albany yesterday. A report of the meeting will be given in our next

THE PAPERS ON DOG TRAINING, which were published in this paper, have been collected into book form and are now in press, to be issued shortly.

EASY READING LESSONS-VI.

FOR THE LITTLE READERS OF THE FOREST AND STREAM.

FOR THE LITTLE READERS OF THE FOREST AND SHEAM.

IT The Day is cold, and He has been sitting long on the Runway, so he has built a Fire and has now fallen asleep. How tired he must be, poor Man, after waiting so long. Hark! what is that Sound? The Hunter does not hear it, He is sleeping so peacefully. What is that pretty Animal with Horns and a white Tail, that has come out of the Woods, and now stands looking at the Hunter, so curiously? It is a Deer. See how gracefully it bounds away. What will the Hunter say when the Dogs come up and wake him? He will discourse upon the Beauties of Nature. What will the other Hunters say when They learn that the Deer went past Him? They will praise his Watchfulness—Oh, yes,

The Sportsman Tourist.

THE OLD RED FOX OF BALD MOUNTAIN.

[CONCLUDED.]

HAD in the meantime heard much of the old red fox, as during the season scarcely a week passed that the dogs did not have a race with him. It would take columns to portray the many exciting tales told of his successful efforts to retain that beautiful brush; ever on the alert, always cool and self-possessed, he seemed instinctively to locate every one of his enemies, and no matter how close a corner they got him into, he would always by some sly maneuver that they least expected manage to leave them, if not actually tearing their hair and gnashing their teeth, at least in a frame of mind very conducive to this condition. Many of these stories are well worthy a place in history. One of his extendring vesages particularly struck me as very remarkable for its display of intelligence. I was perhaps the more impressed with this shrewd trick as I arrived upon the seene just in time to witness the blank looks of the crowd when they discovered that they were sold again.

There had been no hunting for several days, owing to the severe cold and a heavy fall of snow that had drifted badly and was crusted hard enough to bear up a man; at last the wind veered toward the south, it grew warmer, and a few scattered flakes of snow gave promise of a glorious day on the morrow. I had for some time been anxiously awaiting just this state of affairs, and as soon as I caught a glimpse of the first white-winced messenger in the air. I bastened to the HAD in the meantime heard much of the old red fox

veered toward the south, it grew warmer, and a few scattered flakes of snow gave promise of a glorious day on the morrow. I had for some time been auxiously awaiting just this state of affairs, and as soon as I caught a glimpse of the first white-winged messenger in the air, I hastened to the depot and was just in time to catch the train. I arrived at my destination a little after dark, but was still several miles from my old home. I supposed that I should have no trouble in finding a team to take me over, but after an hour spent in truitless efforts, I found that I was literally in a one-horse town, every team was away but one; and old Hopkins, the owner of this steed would not budge an inch, "for the old mare was skittish in the night," but as a compromise he said that he would keep me all night and take me over at the break of day. As I could do no better I was forced to be content. He was as good as his word and routed me up in good season. When I came out I found the team ready, and my eyes were gladdened at beholding four or five inches of moist snow. Deeply thankful for this and blessing my lucky stars for so early a start, I took my seat in the cutter and we were off. The light from the lantern flashed upon us as we started, and I noffeed a kink in the old mare's tail that I did not more than half like, but did not pay much attention to it at the time, as my mind was procecupied dreaming of the glorious run that we were sure to have on so perfect a day as this promised to be. We had gone three or four miles and notwithstanding my abstraction, I had a dim consciousness that we were getting along at a lively rate, when I was fully aroused from my reverie by the frantic efforts of Hopkins to keep the old mare down to her work. She cut up in such a way that I began to think that the old man had spoken the aroused from my reverie by the frantic efforts of Hopkins to keep the old mare down to her work. She cut up in such a way that I began to think that the old man had spoken the truth and that she really was skittish. We went but a short distance further before I was perfectly satisfied that he knew what he was talking about. It was now broad daylight and I could see just ahead that the road made a sharp curve and wound round down a steep descent. Not quite liking the idea of going down the hill at this rate of speed, I advised him to pull her into the ditch where the hard crust would soon bring her to terms.

I have since calmly reviewed the whole performance, and have come to the conclusion that as a common carrier old Hopkins was liable in an action for damages for following

I have since calmly reviewed the whole performance, and have come to the conclusion that as a common carrier old Hopkins was liable in an action for damages for following such pernicious advice, for no sooner did he gee her off than she put on more steam; and the way we tore through the crust was a caution. We soon came to the curve and plunged into a drift; the old mare kept right on, and so did her owner. The cutter shared the fate of the 'Deacon's one-horse shay." I could not tell whether I turned two or three conversalts but I ctured all right citizing and with force into a drift; the old mare kept right on, and so did her owner. The cutter shared the fate of the "Deacon's one-norse shap," I could not tell whether I turned two or three somersaults, but I struck all right, sitting, and with force enough to stick, and luckily facing the right way to get an excellent though fleeting view of old Hopkins, as at a terrific speed, prone upon his belly, he slid down the icy declivity, and, with arms and legs wildly gyrating, disappeared in a cedar thicket. Profoundly grateful that mine eyes had beheld the inspiriting sight, I rose to my feet to go and see if he was hurt. I went, and in the same style, only that I was the other side up. I did not have his good send off, and consequently failed to make his extraordinary time; nevertheless, when I reached the cedars I was greatly surprised at the great difference between perfect rest and the exhibitrating speed of my descent. Neither of us sustained any serious injury; and crawling back to the remains of the cutter, I found my gun all right, and throwing it over my shoulder, I left my traps with Hopkins to forward, and bravely struck out for old Bald Mountain, nearly five miles off.

On account of the bad walking, I did not arrive there until the sun was more than two hours high. Observing quite a crowd mone the hillside. I sone to injure them and were instin

I left my traps with Hopkins to forward, and bravely struck out for old Bald Mountain, nearly five miles off.

On account of the bad walking, I did not arrive there until the sun was more than two hours high. Observing quite a crowd upon the hillside, I soon joined them, and was just in time to witness their discomfiture. It appeared that they had held an indignation meeting the past evening, and had unanimously resolved that the old red must die. They had accordingly mustered in force, and formed a cordon across the mountain through which the wily trickster could not pass. At daybreak they unleashed the dogs upon his well-known trail, and in ten minutes they started him. He took several turns to shake off the dogs, and then headed straight for the line of hunters. One of them saw him break cover and come directly toward him. Congratulating himself that fortune had so smiled upon him, he awaited the fox's approach with glistening eye and throbbing heart. Supremenoment of bliss unalloyed, that ten-fold repays for fatiguing tramp and weary hours of patient watching! A king could not exchange places with him now. See with what caultant books he gazes upon his victim, who has now crossed the death line and is at his mercy. Yet a little nearer, and the old Queen's unisket, so famous for many miles around for its deadly accuracy, leaps to his shoulder; his keen eye glances along the trusty barrel; he catches a good sight of the bright red form, and with estatic triumpl mirrored upon his speaking countenance, he firmly presses his finger upon the fatal trigger. As the well-known peculiar boom of the old gun broke upon the still morning air and reverberated among the hills that returned the sound with a thousand echoes, there came from a score of brawny throats a succession of loud, exultant shouts that fairly drowned the roar of the old gun. Then there was exciled hurrying to the scene, for eager eyes were expecting to behold the lifeless form of the beautiful one who for many years had so artally eluded them and set

their minds, for well they knew that the master of that old gun could truly boast that no fox had ever vontured within its charmed circle and heard its resonant voice and lived to

what is the matter with its proud possessor now But what is the matter with its proud possessor now? Just watch his face and see its serenely triumphant expression slowly change to a wondering, vacant stare as he vainly looks for the struggling form of his expected prey. With breathless speed he reaches the spot. In vain with keenest eye he scans the pure surface of the snow; no flecks of red life blood; not even a single golden hair can he find upon its virgin bosom to comfort his sorrowing heart. Even the track abruptly terminates. He sees at its end the long, thickly lying furrows ploughed by the hurtling lead, and knows that his ain was true. Now, he solves the mystery, and chilly waves creep along his spine as he realizes that our hero is but an intangible spirit fox. Now, at length does he understand the secret of his successful career and can account for his many remarkable escapes and mysterious disappearances; all is now clear and mingled with the vague feelings of awe in his bosom is the glad assurance that the pride and joy of his heart is still worthy his unstinted love, and can still proudly boast that mortal fox ne'er escaped its deadly sim. Many of his companious have now arrived, and showing them the broken trail, he commences his wondrous story, but is interrupted by a loud exclamation from one of them,

sim. Many of his companions have now arrived, and showing them the broken trail, he commences his wondrous story, but is interrupted by a loud exclamation from one of them, who has made a discovery, and calling them up, points to a hole in the snow full fifteen feet from the lost track. Just at its mouth were three or four footprints, that the dogs, who now came up, loudly proclaimed were not supernatural, but, as our old acquaintance, Joe Hicks, expressed it, "of the earth decidedly earthy."

A short consultation was held; and as its owner's faith in the old gun was still unshaken, he insisted that the fox was badly wounded, if not dead, so it was decided to dig him out. Procuring tools from a farm house near by, they commenced the task just as the sun was rising, and for two mortal hours they dug and sweat. Just as I arrived, they had reached that our hero had taken a new departure and dug under the snow more than thirty feet to a wall, where he came out, and keeping in a trough-like space between the wall and drifted snow, had made his escape unseen.
